The Memory of the World in the Digital Age: Digitization and Preservation

An international conference
on permanent access to
digital documentary heritage

26 to 28 SEPTEMBER 2012
Vancouver, British Columbia, Canada
Sheraton Vancouver Wall Centre

UNESCO Memory of the World Programme, Knowledge Societies Division

This book of Proceedings includes most of the papers and posters presented at the International Conference “The Memory of the World in the Digital Age: Digitization and Preservation” held on 26–28 September 2012 in Vancouver, British Columbia, Canada, by the UNESCO Memory of the World Programme, Knowledge Societies Division, and The University of British Columbia in collaboration with the University of Toronto.

The proceedings have been compiled and formatted with minor editing; papers and posters appear as submitted. The authors are responsible for the choice and the presentation of the facts contained in this publication and for the opinions they express, which are not necessarily those of UNESCO and do not commit the Organization.

The designations employed and the presentation of material throughout this publication do not imply the expression of any opinion whatsoever on the part of UNESCO concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The organizers of this UNESCO Memory of the World Programme Conference would like to sincerely thank everyone who contributed to the Conference in Vancouver and to these proceedings.

Published by UNESCO 2013, with the financial support of the Social Sciences and Humanities Research Council of Canada | Conseil de recherches en sciences humaines du Canada (SSHRC) and the International Research on Permanent Authentic Records in Electronic Systems (InterPARES) Project.

Preface

This publication presents the proceedings of the international conference 'Memory of the World in the Digital Age: Digitization and Preservation' which was held in Vancouver, Canada, from 26 to 28 September 2012.

More than 500 experts and other interested persons from all regions of the world participated in this knowledge-sharing and policy-driving event to discuss and exchange opinions on how to protect the world's documentary heritage. Although this heritage is the record of knowledge, its physical carriers are extremely vulnerable and can easily disappear without a trace. Whether recorded on a clay tablet or an electronic tablet, our methods of sharing content and knowledge need to be protected.

It is impossible to exaggerate the importance of documentary heritage in our lives. It governs our actions whether these relate to creating the basis of mutual respect between different civilizations and communities or building knowledge societies. Documentary heritage provides the foundation of peace, our identity and knowledge.

UNESCO's interest in this subject matter is as fundamental as its constitution with its mandate to contribute to building peace through the spread of knowledge from improved access to printed and published materials. These core materials, our documentary heritage, have been preserved in archives, libraries and museums for generations.

But while measures needed to maintain access to print materials are globally understood, the newer challenges related to preserving digital information are not keeping pace with technological development. The need for dedicated hardware and software, associated with their rapid obsolescence, hamper our ability to keep invaluable content accessible. Unless timely migration to newer technologies, operating systems and software platforms is assured, we face the risk developing digital Alzheimer's.

UNESCO's expectation from this Conference was to obtain a better definition of our expected role, and our contribution to setting a global digital agenda. The UNESCO/UBC Vancouver Declaration sets out specific recommendations which we will be implementing and incorporating into our digital strategy. Likewise, we expect that our Member States, professional organizations and private sector bodies will also implement the recommendations addressed to them.

Only through collaborative strategic alliances can we overcome the major challenges threatening the preservation of digital information. We believe that the presentations featured in this publication provide the basis for a global commitment to preserving the memory of our world in this digital age.

Jānis Kārklīš
Assistant Director-General
for Communication and Information

Keynote: Wrestling with Shape-Shifters

Perspectives on Preserving Memory in the Digital Age

Kenneth Thibodeau

Abstract

Digital preservation is a difficult challenge due to the polymorphous character of digital information and the environment of ongoing, open-ended and multidimensional change in which it exists. The paper describes both aspects of the challenge and explores how multi-faceted and dynamic approaches to digital preservation in different circumstances can be articulated.

Author

Dr. Kenneth Thibodeau is an internationally recognized expert in electronic records and digital preservation. A senior guest scientist in the Information Technology Laboratory of the National Institute of Standards and Technology of the U.S., he previously directed the Center for Advanced Systems and Technology and the Electronic Records Archives Program at the National Archives and Records Administration in Washington. He also served as the Chief of Records Management at the National Institutes of Health and directed the Department of Defense Records Management Task Force, leading the development of the world's first standard for records management software. Fellow of the Society of American Archivists, Thibodeau won the Emmett Leahy Award and a Lifetime Achievement Award from the Archivist of the United States.

“Words strain, Crack and sometimes break, under the burden, Under the tension, slip, slide, perish, Decay with imprecision, will not stay in place, Will not stay still.”

-- T.S. Eliot¹

The poet T.S. Eliot's passionate incantation of the difficulties of fixing memories in words might be appropriated to describe the difficulties of preserving memory in digital form. Like the raven in North American cultures or the fox of Japanese folklore, digital memory is a shape shifter that takes on very different forms, driven by two distinct causes: first the characteristics of digital information itself and second the environment of change that engulfs digital information objects. There is thus an inherent tension between digital information, which does not stay still, and digital preservation, which quintessentially seeks to keep things in place, without significant change.

1. Polymorphous Information

In contrast to information recorded on stone, clay tablets, paper, or other 'hard copy' media, digital information is polymorphic in several respects. First, digital data is not and cannot be affixed to a physical medium in a durable fashion. Its physical inscription changes every time it moves from computer memory to a storage medium or back, every time it is copied to a different storage medium, and whenever it is transmitted on a network. Digital preservation is not a process of preserving material things, but of

¹ T.S. Eliot, "Burnt Norton," in *Collected Poems, 1909-1962* (New York: Harcourt Brace and Company, 1963), 180.

transporting immaterial bit streams over time, using whatever storage media satisfy preservation needs for however long they are suitable. Most digital storage media are not long lasting, but have to be replaced after some time. The cause of this is the economics of the marketplace, rather than technological or physical constraints on possible storage media. Indeed, several digital storage media have been developed that should last for hundreds or even thousands of years, including microfilm,² metals, gold coated silicone,³ and other formulations;⁴ however, the longevity of the medium is outweighed by the fact that storage devices become obsolete within 5 or 10 years.⁵ Obsolescence in the digital storage domain includes not only equipment that becomes increasingly difficult to maintain and media that wear out, degenerate, and become rare, but also the increasing expense of older storage technologies relative to newer alternatives because of exponential increases in storage density, improvements in data transfer rates, and significant decreases in purchase and operating costs.⁶

A second polymorphic characteristic of digital information is that the boundaries of a digital object can be difficult to determine. For example, web pages often include content that is not visible to the user or that is loaded into the page from external sources each time the page is viewed. External sources include links to other web pages, style sheets, graphic images, Java scripts, data about the person using the page, data elements extracted from databases, and others. Whenever any of these external sources changes, the content of the page changes accordingly, making it difficult to define what is the content of a web page we want to preserve. Moreover, parts of the content of a digital document may be subject to different ownership and control.⁷ In order to preserve a web page, we have to define it as a finite object; that is, we have to apply extrinsic criteria, cutting off at least some external sources of input in order to establish well defined boundaries, but these boundaries are not present in the web page itself.

Furthermore, although many web pages are transitory, many web sites have persisted for decades. The key to this survival is that they are dynamic. They evolve in response to changes in the enabling technologies and also to data about what does and does not work in achieving the purpose each web site is intended to serve. Any attempt to preserve such web sites as static objects loses this essential characteristic of the web site as an evolving entity.

These considerations bring us to a third polymorphic characteristic of digital memories: the relationship between what is stored and what is presented to a human can be both complex and variable. What is presented to a human, as a single object may comprise content drawn from many different data stores, as illustrated in the preceding description of web pages. Databases include rules, invisible to all but administrators that determine what specific data elements different classes of users, or even individual users, can access. Word processing files can contain content that their authors thought they had deleted.

⁷ John Patzakakis and Brent Botta, "Authenticating Internet Web Pages as Evidence: a New Approach," *Next Generation Law and eDISCOVERY Tech Blog*, June 27, 2012. <http://blog.x1discovery.com/>.

Just as something that appears to a human as a single document may be drawn from many data stores, one item of stored digital data may be part of many different objects. For example, a web page may contain links to many other pages, and each of those pages could also be referenced by many others. Conversely, different data can produce identical presentations. A textual document, for example, may be generated from a word processing file, the scanned image of a paper document, or as a report from a database. Thus, in preserving digital memories, we need to distinguish between the *data objects*, which are stored in computer systems, and the *presented objects*, which are derived from the data objects and are presented and at least potentially meaningful to people.

Another polymorphic property of digital memories is that data objects must be processed in order to be used. Moving the data between storage and presentation, or between transmission and presentation can involve changes in semantic, syntactic and apparent form. Even if the data remains intact in storage or transmission, processing for presentation can change or even corrupt the presented object. Furthermore, apart from any question of alteration or corruption, the same digital data can be rendered in different ways; for example, numeric data can be presented in tabular or graphic form. This ability of data objects to take on different shapes may not be merely an incidental possibility. It can be an essential characteristic of the memory we want to preserve. A clear advantage of digital imaging systems in science, medicine, and engineering, for example, is that they allow the data to be presented in a variety of ways. In addition, one of the most prominent aspects of the current digital environment is that much information is intended to be rendered on different types of devices, ranging from various mobile platforms through laptops and desktops to even wall sized and billboard displays. Besides further complicating the distinction between data objects and presented objects, this adaptable display capability contributes to ubiquitous computing, which is changing the role of information and communication technology (ICT) in human affairs.⁸ Thus, preserving data objects is not sufficient for digital memory. We must also maintain the ability to process the data correctly and appropriately.

The polymorphism of digital information means that even the apparently basic issue of what is it that is to be preserved is not a given, but involves choice: should we preserve what was displayed in a given instance or the data, structures, controls, and functionality that enabled the presentation, or both? In order to decide on appropriate choices, we have to consider not only the characteristics of the data objects and presented objects, but also the dynamic context in which digital information exists.

2. An Environment of Change

Digital preservation has a split personality: its object, memory, is from the past but its objective, access, is in the future. This schizophrenia is aggravated by the environment of ongoing, open ended and multidimensional change in which digital information exists.

Ongoing change has two faces, one looking forward, the other backwards. The forward face, technological progress, introduces frequent alterations in both hardware and software that can also include significant innovations or departures. The backward face of ongoing change is obsolescence: older products are no longer supported and become inoperable or unusable, so that, even if we can preserve the data objects, we may not be able process them or to reproduce the presented objects that the data represent. Even in cases where older technology could be maintained, improvements in price/performance

⁸ Adam Greenfield, *Everyware: the Dawning Age of Ubiquitous Computing*, (Berkeley, CA: New Riders, 2006).

of newer products impel us towards replacing it. Obsolescence has been a main focus of attention in digital preservation.⁹ But even if obsolescence were not a factor, changing user expectations about access impel us to alter preservation tactics over time in order to take advantage of technological progress. Moreover, newer technologies may offer better options for preservation, making older preservation solutions themselves obsolete. Technological progress in itself should be anticipated and incorporated in planning for and carrying out digital preservation in order to enable use of the best current technology to preserve, examine, process, and communicate information from the past.

Change in ICT is not only ongoing; it is also open ended, with often surprising developments. The history of ICT since the mid twentieth century is one of repeated transformational changes, where the technology gains new capabilities; new functions are added; new classes of hardware and software are introduced; and even methods of producing and implementing technology change. Software paradigms have shifted from structured to object-oriented, to component-based, and to service-oriented approaches. The emerging paradigm of autonomic computing opens possibilities for additional, radical changes.¹⁰

Technological change has also expanded the varieties of information that ICT can handle. Computation was initially limited to numeric data. Over the last three decades, ICT's scope has grown to include more and more traditional forms of information, such as text, images, audio and motion video. And it has created new forms that cannot exist outside of the digital realm. Additionally, increases in speed and capacity have created new possibilities for processing and communicating information, greatly expanding possibilities for selecting, combining, analysing, and applying different types of information from disparate sources for a variety of purposes. All of this adds considerable diversity and complexity to the challenge of digital preservation.

Moreover, changes in one sphere can snowball into others. Web 2.0 flies in the face of traditional, pre-determined, and systematically controlled user interactions by enabling structure to emerge over time through use of free-form software tools.¹¹ The expansion of mobile computing has spawned the proliferation of "apps," which are substantially changing the end users' acquisition, use, and experience of software, while menacing corporate control of ICT resources.

Moreover, the environment of change is not limited to changes in the technology itself or the types of information it produces. Rather it is multidimensional. First, ICT changes the way we do things. Think, for example, of the differences it has enabled in the interactions between businesses and their customers or between citizens and governments. Second, ICT changes the things we do. For example, geo-positioning technology is enabling precise location tracking of individual vehicles, goods, and people, with substantial impacts on many commercial, governmental and social activities. Third, ICT changes who does what.¹² Prior to the growth of the Internet, for example, advertising was one-way dissemination function, but the possibilities the World Wide Web offers for active customer involvement via social computing has transformed advertising into a multidirectional form of communication in which

individual and collective initiative by consumers can have rapid and decisive impact.¹³ The memory of the digital age would be greatly impoverished, and probably falsified, if it does not take into account the additional dimensions of change precipitated by changing technology.

Indubitably, multidimensional and transformative changes will continue in the future, at least as long as ICT continues to change. Inevitably, the challenge of preserving digital memories, and therefore its complexity and difficulty, will evolve apace with changes in ICT and its impact.

3. A Plethora of Choices for Preservation

The polymorphous and metamorphosing characteristics of the challenge of preserving digital memories necessitate multi-faceted, diversified, and dynamic approaches to digital preservation: multi-faceted in order to deal with the polymorphism of digital information; diversified in order to accommodate varying requirements in different social, cultural, and institutional contexts; and dynamic to respond to continuing changes in ICT and its uses and in future user expectations and needs. We can elaborate approaches that take into account the immensity and difficulty of preserving digital memories and that are appropriate to different contexts by addressing three questions: what are you trying to preserve; why are you trying to preserve it; and how much preservation effort is required?

3.1 What are you trying to preserve?

The question of what is to be preserved does not concern selecting things to be preserved, but determining what properties of those things have to survive in order to assert that they have in fact been preserved. Given the polymorphism of digital information, determining the properties that are essential to preserve can be complicated. The possibilities span a spectrum from the preservation of technology to the preservation of information. Between these extremes is the preservation of information artefacts created using the technology. Each alternative responds to different needs and entails different actions.

An obvious case where we would need to preserve information technology would be that of digital artworks that depend on unique technologies. At the other end of the spectrum, for example with statistical data, all we would need to preserve is the information because users could access and use the information with readily available hardware and software. In the middle would be classes like three dimensional models, where we would want to preserve functionality, such as the ability to rotate the model visually, that requires special technology, but where there are alternatives to the original technology used to produce the models.¹⁴

Obviously, determining where digital objects fall on the spectrum of preservation possibilities does not depend solely on the properties of the objects themselves. It is also a function of both the *object class technology* and the available *preservation technologies*. Object class technology includes both the original technology used to produce the data objects and technology currently available for that class of data objects. Preservation technologies are those created to maintain digital memories when the original technology is obsolete and there are no satisfactory alternatives outside of the preservation realm.

¹³ Shuai Yuan, Ahmad Zainal Abidin, Marc Sloan, and Jun Wang, "Internet Advertising: An Interplay among Advertisers, Online Publishers, Ad Exchanges and Web Users," 2 Jul 2012. <http://arxiv.org/pdf/1206.1754v2.pdf>.

¹⁴ Peter Bajcsy, Appraisal of 3D Data Conversions and Visualization Software Packages, January 21, 2009. <http://www.archives.gov/applied-research/ncsa/>.

Illustrating how technology impacts where objects fall in the spectrum, the class of geographic information systems (GIS) is distinguished from mere geographic data by the ability to display data in a cartographic presentation having selected that data from many different types of data stored separately. In principle, as long as we can select data from the separate layers in a GIS and display them in map form, we do not need to preserve the original GIS software. If there were interoperability across GIS formats, GIS would be situated in the middle of the spectrum. However, most GIS depend on proprietary software, which often has features not present in other products in the same object class. If these features were deemed necessary to preserve, maintaining the technology that supports the unique functionality would be necessary, pushing GIS to the technology end of the spectrum.

A given class of digital objects could move across the spectrum, even from one end to the other. In the early days of word processing, for example, visual display technology was too crude to present text in different typefaces. In the 1980s displays were introduced that enabled text to be displayed on screen just as it would be printed on paper, but at that time the only way to preserve that presentation capability was to maintain the specific display technology. Today, however, we do not need any special technology to present text documents from the 1980s with their original formatting.

In sum, then, digital information objects fall at the ‘preserve technology’ end of the spectrum when the only way to ensure continuing access to them is to preserve the original technology or some equivalent or surrogate, such as an emulator. Objects fall at the ‘preserve information’ end of the spectrum when, given their physical survival, they can be accessed using readily available current technology. Objects fall within the ‘preserve information artefacts’ range when they require specialized processing capabilities to render the data objects, but there are alternatives to using the original technology.

In some situations, more than one approach to digital preservation might be appropriate. In the case of interactive digital artworks, where the audience or spectators are involved in real time in the production or performance of the creative work, we face the alternatives of preserving the technology that makes the experience possible or somehow capturing the performance at some particular time and preserving that. In the first alternative, preserving the technology used in performing the work, we would not be preserving memories of specific happenings, but the capabilities that make such happenings possible. In the second, we would not be preserving the digital artwork, but a derivative product that not only does not include any of the technology of the artwork, but also is bereft of precisely what made the art interactive and creative. Basically, this is no different than the alternatives of preserving a written musical score and preserving a recording of a performance of the score.

We also face the option of preserving technology or preserving information in the case of websites where inputs from external sources constantly change what is presented. To enable people in the future to appreciate how users could interact with such a website, we would need to preserve the technology of the website, but that would provide no knowledge of what any users actually saw or might have seen on the website at any time in the past. For that, we would need to preserve snapshots of the website. We cannot decide which alternative is appropriate solely by considering the properties of the information and related technology. For that we have also to address the second question, the purpose of preservation.

3.2 Why are you trying to preserve it?

In addition to the properties of the information objects themselves and the state of related technology, determining the appropriate course of preservation actions depends on the purpose for which digital

information is preserved. We can distinguish two basic reasons for preserving information: either for remembrance or for utilization. We preserve information for remembrance in order to provide the future with opportunities to gain knowledge of the past from materials produced or acquired at the time of which we wish to gain knowledge. We preserve information for utilization in order to enable future use of that information for purposes that are likely to be different from the purposes for which they were created or acquired. While remembrance and utilization are not essentially contrary to one another, they lead us to different preservation actions. Preserving for remembrance would lead us to maintain digital memories as pristine as possible. This goal is best served in many cases by preserving the original information technology. But preserving information embedded in specific technologies creates barriers to exploiting this information in the future. To optimize possibilities for utilizing preserved memories, we would want to reduce or eliminate dependencies on the hardware and software originally used to produce and/or retain the information.

Decisions on what we are preserving and why we want to preserve it are interrelated. This is illustrated in the case of preserving email and other communications on the Internet. In order to work globally, email has to be independent of specific hardware and software as well as relatively impervious to technological change. Thus, there is no need to preserve information technology to preserve email messages. Several initiatives have approached email as an artefact of technology, maintaining the organization of messages within individual users' accounts, because that is the way the technology is implemented.¹⁵ However, if we focus on the value of the information in email as evidence of the conduct of human affairs, the emphasis shifts to the communications between and among individuals and groups of individuals. The threads of communication that evince and often enable important developments in human history are outside of the confines of individual users' accounts and even of the administrative domains of email implementations. To preserve the memory of events ranging from the Arab Spring¹⁶ to the international outpouring of charity on behalf of an elderly school bus monitor who was abused by schoolboys in New York State this spring,¹⁷ we need to preserve the connections among the messages, independently of the artefacts of the enabling technologies.

3.3 How much preservation effort is needed?

What is done to preserve digital memories also depends on how much effort is required. The amount of effort is proportional to the level of resources required to accomplish it. In most cases, resources will be the independent variable. Resource limits may have major impact in determining what is preserved and what preservation actions are carried out. Three sub-factors determine the amount of preservation effort required: quantity, variety, and range.

How much information? In the digital realm, quantity should be measured in both the volume of digital data to be preserved and the number of discrete objects the data comprise, and the probability of substantial growth in both parameters should be a major concern. Between 2006 and 2011, the amount of

¹⁷ Rene Lynch, "Bullied school bus monitor calls it quits: She's retiring," Los Angeles Times, July 27, 2012. <http://www.latimes.com/news/nation/nationnow/la-na-nn-bullied-school-bus-monitor-retires-20120727,0,6307218.story>.

digital data produced worldwide doubled every two years, exceeding a trillion gigabytes in 2011, and it is expected to increase fifty times more by 2020. The number of files containing this data has increased even faster and is expected to increase seventy-five times by 2020.¹⁸ These staggering numbers have both global and local implications: there should be significant benefits from international coordination to avoid wasting resources on duplicative efforts and to promote the development of technical capabilities that can be widely implemented; technical solutions developed for particular preservation challenges need to be scalable to accommodate projected growth; and repositories need to anticipate growth in data volumes and numbers of objects that will eclipse everything they have faced until now. The only exceptions would be closed collections, where there will be no further additions.

Given the probability of growth, the quantity of information to be preserved will probably become an increasingly important factor in deciding what gets preserved and how much effort is expended on any set of objects over any period of time. In cases of very valuable information resources, preservers may have to settle for merely ensuring the physical survival of data objects because there will not be resources and perhaps not even any technical possibilities for addressing other requirements, such as overcoming obsolescence or enhancing access.

What variety of digital memories is preserved? Preservation efforts will demand more resources and become more complex as the variety or heterogeneity of the information objects being preserved increases. In general, the greater the variety of objects being preserved, the greater the variety of preservation tactics that will be needed. Homo- and heterogeneity of digital memories are determined at several levels. At the highest level, they relate to the types of information; such as, text, image, audio, motion video, and so on. In addition, in the digital realm, any type of information can be represented in different ways; e.g., text may be encoded as characters or as images of printed documents, and graphic information may be represented by raster or vector data. So, for any type of information, we need to know what data types are used to express it in digital form. Going another level down, a given data type can be encoded in a variety of formats. For example, character encoded text may be in plain text, rich text, Hypertext Markup Language (HTML), eXtensible Markup Language (XML), portable document format (pdf), Microsoft Word, Apple Pages, and other formats.¹⁹

Furthermore, a digital object may be more or less complex. A digital document may consist entirely of textual information all encoded in a single format, but it might comprise several types of information; such as, text, photographs, graphic illustrations, and even audio. A Web page may include static text, data drawn dynamically from a database, images, applets that enable interaction with users, et al.

The variety of formats, and the complexity of objects are also likely to increase the variety of hardware and software necessary to support them. For example, preserving purely numeric data can be very simple; however, if the data are embedded in an object where the specific content is determined in real time from user input, it may be necessary to preserve the database management system used to manage the data, as well as technology needed to reproduce the corresponding presented objects.

What is the range of preservation efforts? Preservation efforts may be directed only at objects individually or extend to preserving relationships among objects. It is not a question of whether objects are related. Basically, all objects subject to a given preservation regime are related simply by virtue of

¹⁸ John Gantz and David Reinsel, *Extracting Value from Chaos*, 2011. http://www.emc.com/digital_universe.

¹⁹ John C. Bennett. "A Framework of Data Types and Formats, and Issues Affecting the Long-term Preservation of Digital Material," *JISC/NPO Studies on the Preservation of Electronic Materials*. British Library and Information Report 50, Version 1.1. 1999. <http://www.ukoln.ac.uk/services/papers/bl/jisc-npo50/bennet.html>.

being held in the same repository or being part of the same collection. Generically, we should distinguish cases where things are simply compiled or grouped together, with no intrinsic ordering or relationships among them, from combinations where there are relationships that must be preserved along with the individual objects. In the case of ‘records’ as defined in archival science; that is, documents produced or acquired and kept in the course of activity, there are essential relationships among records of a given activity; for example, between a letter and the response to it, and between a plan and documents produced in executing the plan and evaluating its success. If these archival links are lost, the possibility of reconstructing the activity on the basis of the evidence provided by the records is diminished.

For purposes of digital preservation, what matters is not the existence of relationships, but whether the relationships require preservation efforts in addition to those required for individual objects. Consider a set of digital maps produced by scanning printed maps. There would certainly be relationships among the maps if they were all pages in a printed atlas, and we would need to ensure that both the relationship of parts to the whole and the sequence of maps in the atlas were preserved; however, these relationships could adequately be preserved in metadata. That would not require any special digital preservation efforts. In contrast, consider the maps that could be produced from a geographic information system. No amount of metadata would be sufficient to preserve a GIS. Many GIS contain such a rich store of data and provide so many options for displaying the data that it would not be possible even to enumerate the set of maps that could be produced using the system. Furthermore, the option of simply preserving each of the various data types or “layers” included in the GIS would not be sufficient because it would not preserve the essential ability to select data elements both within and across layers for composite display in cartographic form. A GIS, which normally consists of cartographic and attribute data, might also be linked to other types of information, such as scientific observations made at specified locations, or historic photographs taken at different times. Preserving such systems requires maintaining the links to such heterogeneous types of information and maintaining the ability to locate them correctly in presented objects.

4. Conclusion

Obviously, digital preservation constitutes an enormous and difficult challenge, one which we must attack less we fail to address important cultural, educational, scientific, social, governmental, and practical needs which depend on, or would benefit from, access to digital memories. The three questions of what, why and how much combine to form a framework for rational discourse on digital preservation, one that embraces the polymorphic character and metamorphosing context of digital information. The framework should guide an integrated and parallel consideration of the three questions because their answers will often be interdependent. This framework should be useful in a variety of contexts, ranging from articulating a theory of digital preservation; to developing a specialized bodies of knowledge and skills, such as digital curation and archival engineering; planning for and managing repositories; developing and implementing strategies for particular sets of information objects to be preserved, and defining the need for preservation technologies, guiding their development, and evaluating the relevance and adequacy of specific preservation techniques.

Keynote: Trust and Conflicting Rights in the Digital Environment

Luciana Duranti

School of Library, Archival and Information Studies, The University of British Columbia, Canada

Abstract

While evolving and emerging digital technologies serve the needs of governments, businesses and individuals to great advantage, the often unintended consequences of their use may be harmful. When WikiLeaks began publishing the largest set of confidential documents ever released, it exposed how endangered are our cherished, yet sometimes conflicting rights—secrecy vs. transparency, privacy vs. access—in the digital world. Moreover, making, storing and accessing records in the highly networked, easily hacked environment of the Internet, is creating liabilities that institutions may not have thought they were assuming. Can the data be trusted? Can the documents from which the data are derived be trusted or even traceable? Are they complete? Are they authentic? Who has access to them? How secure are they? The overview of these and other legal challenges provides a framework for the presentations discussing them.

Author

Luciana Duranti is Chair of Archival Studies at the University of British Columbia, and a Professor of archival theory, diplomatics, and the management of digital records in its master's and doctoral archival programs. She is Director of the Centre for the International Study of Contemporary Records and Archives (CISCRA) and, among many research projects about the issues presented by digital records, InterPARES, Digital Records Forensics, and Records in the Clouds. She is co-Director of "The Law of Evidence in the Digital Environment" Project. Duranti is active nationally and internationally in archival associations and committees, such as the UNESCO International Advisory Committee of the Memory of the World Program; and has been the President of the Society of American Archivists, of which she is a Fellow. She publishes widely on archival theory and diplomatics.

"Whatever matters to human beings, trust is the atmosphere in which it thrives"

*Sissela Bok*¹

On November 28, 2010 WikiLeaks began publishing the largest set of confidential documents ever released, provoking the outrage of governments worldwide, regardless of the many individual voices claiming the morality of such action. Revelation of secret documents is nothing new. What is new is the scale of the phenomenon. Technology has allowed for the uncontrolled growth of databases that can be accessible from any distance. With the amount of data/documents/records created and maintained in digital form, there is a new social awareness of their information potential, and the ease with which they can be disseminated highlights the vulnerability of all parties involved. This fact in itself is at the root of a redistribution of power—the right to know is becoming the core of a new form of democracy that refuses to be held captive to old mechanisms. The WikiLeaks model is destined to spread. TradeLeaks and BrusselLeaks are examples, claiming to reveal frauds in commerce and in the political dealings of European Union members, but in the process, risking damage to the rights of individuals, organizations

¹ Sissela, B. (1978). *Lying*. New York: Pantheon Books.

and governments, as well as to their legitimate operations. These developments are resulting in demands for increased security surrounding digital information, but technology is not the whole answer. *The challenge is providing transparency while protecting the arcana imperii (state secrets).*

In an interesting twist, WikiLeaks entrusted the selection and dissemination of the information to five newspapers for the purpose of avoiding making available data that would hurt military operations or human beings. The old press put its authority at the service of rights to transparency and access by helping certify the reliability and authenticity of the documents, a function of vital importance when their origin is not known and the accuracy of their content may be in doubt. *The challenge is establishing documents' accuracy, reliability and authenticity and maintaining it over time in such a way that it can be proven.*

It is worth noting that Sweden, which in 1766 passed the oldest freedom of information law, is the country that most fiercely condemned the WikiLeaks disclosure. But condemning an action does not prevent its repetition. Iceland recently approved a law that allows for the publication of secret documents. Germany is following suit and so are other countries. Developing new legislation for access requires a profound understanding of the digital environment, of the information generated within it and the various forms it takes, and the way it relates to actions, transactions and facts. *The challenge is to develop legislation and procedures based on an understanding of the way in which digital records serve and protect the rights of the people and of those who govern them.*

In 2009, the Information Commissioner of Canada, in a report entitled *A Dire Diagnosis for Access to Information in Canada*, wrote: "The poor performance shown by institutions is symptomatic of what has become a **major information management crisis** (emphasis original). A crisis that is only exacerbated with the pace of technological developments. Access to information has become hostage to this crisis and is about to become its victim. There is currently no universal and horizontal approach to managing or accessing information within government. Some institutions don't even know exactly what information they are holding."² *The challenge is to develop an infrastructure that ensures a seamless controlled flow of authentic data/documents/records from the creator to the preserver irrespective of changes in technology.*

The right of societies to an enduring documentary heritage became the mission in 1992 of the UNESCO Memory of the World Program. The program inscribes in its registers the records of human achievements as well as those of the darkest moments of human history. It is now grappling with the development of guidelines for the preservation of nominated digital material, which will enable custodians to ensure its continuing authenticity and reliable permanent preservation. *The challenge is to provide guidance to countries, organizations and individuals with different resources and from different cultures, connected by the Internet but divided by their ability to realize its potential while protecting themselves from its risks.*

The challenges described show that several conflicting rights, directly linked to the creation, management and preservation of data, records and archives, are at risk in the digital environment: **the right to transparency and to secrecy, the right to access and to privacy, the right to knowledge and to economic gain, the right to dissemination of one's work and to its integrity, the right to memory and to right to be forgotten, the right to the endurance of one's heritage and the right to oblivion.**

² Office of the Information Commissioner of Canada. (2009). *A Dire Diagnosis for Access to Information in Canada*. Online: http://www.oic-ci.gc.ca/eng/med-roo-sal-med_spe-dis_2009_4.aspx.

How can we protect these conflicting rights? Whom and what can we trust with the care of the digital objects that embody them, attest to them, support them, result from them, are the object of their exercise, or disseminate them so that they can be nurtured, respected, guaranteed, and regarded as certain and clear? The certainty of people's rights as objectified in the world's documentary residue is one of the pillars of every democratic society. As Baldassare Bonifacio wrote in 1630:

There is nothing more necessary for clearing up and illustrating obscure matters...for conserving patrimonies and thrones, all things public and private, than a well constituted store of volumes and documents and records—as much better than navy yards, as much more efficacious than munitions factories, as it is finer to win by reason rather than by violence, by right than by wrong.³

And as Sir Hilary Jenkinson re-stated three centuries later, documents are “the material evidence of the historical case.”⁴ Again, whom or what do we entrust with this invaluable store of rights?

Traditionally, trust in documents has been based on trust in those who hold them in custody. The grounds for it are: *reputation*, which results from an evaluation of the custodians' past actions and conduct; *performance*, which is the relationship between the custodian's present actions and the conduct required to fulfil his or her current responsibilities; *competence*, which consists of having the knowledge, skills, talents, and traits required to be able to perform a task to any given standard; and *confidence*, which is an assurance of expectation of action and conduct.⁵ With respect to the digital material produced by contemporary society in both the public and private sphere, do we still have confidence in the competence, performance and reputation of those who have it in their custody? If we do, should we? Is the legal framework in which they operate strong enough to ensure that our trust is well placed?

In contemporary practice, individuals and organizations are increasingly saving and accessing records in the highly networked, easily hacked environment of the Internet, where current policies, practices and infrastructure prohibit us from being able to assess our trust in records relying on the kind of understanding we used in the past. How do we know that those who hold digital records about us make the right decisions about keeping them safe, and accessible only to those who have a right to see them, using them for good and in a transparent way, disposing of them when required, and selecting reliable Internet providers for storing and managing them? Who has established the rules according to which they operate, and in the context of what values and purpose?

The interconnectedness of the Internet is forcing us into one community without the benefit of gradually getting to know one another. As the United States developed the Internet, its social, political, and economic views are reflected in its management, thereby rankling other countries. A recent example highlights the risks of using a consumer file-sharing service for business purposes when it is not clear what legal framework controls it. U.S. federal prosecutors blocked access to the file-sharing site Megaupload.com on charges that the site violated piracy laws, and New Zealand police arrested Megaupload's founder based on the U.S. accusations. As a consequence the data of at least 50 million

Cambridge University Press, Cambridge.

Megaupload users ran the risk of being erased.⁶ Convinced that existing laws could not deal with growing piracy concerns, the U.S. Congress introduced the *Stop Online Piracy Act (SOPA)*, which resulted in protests across the Internet that persuaded Congress to reject the bill. In the meanwhile, the European Union proposed a “right to be forgotten” directive, which would have required every member state to issue legislation protecting online intellectual rights and privacy.⁷ Thankfully, this initiative also, was unsuccessful, but it shows how unclear is what is best to do. Google established a blanket privacy policy for all materials on its cloud,⁸ while Twitter chose to go the opposite way and to adopt the policy of the country of origin of the record.⁹ Indeed, the Internet has forced us into one community, but one community in desperate need of a shared legal framework that promotes consistency and balance in terms of policies and practices regarding the handling of digital objects, especially when they reside with Internet services and social media providers.

In fact, regardless of several public cases of dramatic documentary incidents, people in general trust all kinds of organizations, like banks and phone companies, to keep and maintain their data/records/archives on their behalf. In effect they have shifted their trust from the central records repository in their home or office to distributed archives online, the stewardship for which is entrusted to others. Where their records actually reside, how well they are being managed, how long they will be available to them... they have no idea! Many organizations are recognizing this shift and becoming concerned about a liability they may not have thought they were assuming, especially as more and more clients abandon their own recordkeeping, and place greater reliance and trust on the recordkeeping abilities of the organizations with which they interact.

In additions, commercial organizations like telecommunications services, distributors, and the like, are amassing huge volumes of data that they use to provide a host of services, many of which focus on marketing and securing competitive advantage. This is the evolving world of big data’, the exploitation of seemingly innocuous records, like call centre records, purchase orders, etc., to produce data that can be re-manipulated to serve a host of purposes, also called ‘data mining.’ Big data is introducing a view of our documentary output that flips our traditional view on its head: certain records can grow in value if it is recognized that their accumulation through time will enable the production of data that themselves will grow in value as their potential to support organizational priorities—especially strategic priorities—is realized. However, big data also fosters a range of democratic objectives, from promoting government transparency to supporting research to contributing to public-private sector goals and priorities. Thus, legislation, regulations, policies are needed to control these activities so that their benefits can be ripped and their risks contained.

The issues for data and records coincide. Can the data be trusted? Can the records from which the data are derived be trusted? Are they complete? Are they authentic? How were they generated, by whom and under what conditions? Is there sufficient contextual information to enable them to be understood? These are questions faced by quite a number of organizations that are beginning to act on the realization

that their data holdings, and the records generating that data, are digital assets that need to be managed effectively if they are to be trusted by those making decisions and by clients, customers, citizens, etc. One of the catch words in this arena is ‘traceability’, that is, the ability of an organization to trace back from the data it is using for decision-making, service delivery, etc., to the source records from which the data are derived. The issue of traceability of data to trusted records is becoming huge and constitutes the foundation of trust in data.

Different but equally significant issues are generated by the fact that individuals and organizations, large and small, are drawn increasingly by the lure of cloud computing for the many benefits it offers. Scalable, agile, efficient, on-demand computing resources mean that email, photos, documents, records, and archival fonds can be easily stored and shared through a seemingly endless number of hosted web applications, and that sophisticated software, platforms, and infrastructure are available to the budget-conscious and the technology-resource limited. Cloud architectures offer on-demand access to services across a network of standard internet-accessible devices—mobile phones, tablets, laptops—and a vast array of other equipment, such as game consoles, MP3 players, and e-business technologies. Resources are shared among users, and resource use is monitored and invoiced based on usage for service. We choose—and increasingly rely on—cloud services for communication, backup and storage, collaboration, distribution, recordkeeping and preservation. But for every benefit there is a corresponding risk that may or may not be recognized.

The model of cloud computing is reminiscent of the mainframe environment of the 1960s, except that in this case we are not putting our trust in the proprietary and highly controlled environment of the company mainframe, but in global service providers, whose agendas and priorities as they build out their infrastructures are very different from our own. The trust relationship demands careful analysis and consideration and it is important to highlight specific challenges to entrusting data, records and archives to the cloud. Key issues of ownership, jurisdiction, and privacy have yet to be resolved. Longer term concerns around responsibility for maintenance, access, and preservation, all of which correspond to issues of trust, are looming on the horizon. The following list identifies some legal concerns but is by no means exhaustive:

- The servers in which data and records are stored may be, but likely are not, in the same country or jurisdiction in which they were created. In the event of litigation or other dispute, in what jurisdiction will they be governed?
- Do you even know with which provider your material is stored? As the cloud storage market continues to grow, this becomes increasingly unclear. New storage providers are appearing who aggregate unused storage from third parties. The entrance of a peer-to-peer model for storage adds further complexity to teasing out the tangled web of provenance, custody, control, and legal responsibility.
- Will trade secrets or legal privilege, if entrusted to cloud storage, continue to exist after they have been shared with a third party?
- How will cloud service providers protect content from data breaches? There is a school of thought that says you should be concerned not about *if* a data breach occurs, but *when* it occurs. How will your cloud service provider handle a breach? Will your provider even admit to a breach?

- Audit is usually not allowed by cloud providers: How do you prove authenticity and an unbroken chain of custody?
- What happens to content if a cloud service provider goes offline, due to bankruptcy or criminal investigation, or if the server containing your material is sequestered for an investigation?
- How do you transfer the material to the designated cultural institution with independent evidence of chain of custody?

With these questions in mind, returning to the concept of trust and the protection of rights embodied in and exercised through data, documents, records, archives, if trust rests on our confidence in the reputation, performance, competence, and confidence of the custodian of our digital material, we must ask hard questions of those to whom we entrust our data, records and archives. International research projects into the nature of digital records have developed guidelines and solutions to managing authenticity, accuracy and reliability in digital records systems, but solutions are often out of reach financially for many individuals, organizations and countries driven by the bottom line. National and international standards of records and information management provide guidance but adherence is not legally required in most sectors. Cloud computing offers to ease the financial burden of many aspects of records management and archival storage, but—as we have seen—raises a host of new and troubling questions that must be answered if we are to be able to trust and maintain access to our material. Technology will not stand still to wait for our legal and regulatory system to catch up. Even if it did, domestic legislation, as controlled as it is by the higher law of each country, and, in common law countries, also by case law, would often be conflicting with that of other jurisdictions, and, looking at the world map, we would be seeing a tower of Babel of legislations that create more problems than they can solve.

What we need is an internationally agreed upon legal framework that will support the development of integrated and consistent local, national and international networks of policies, procedures, regulations, standards and legislation concerning digital records, to ensure public trust grounded on evidence of good governance. Such legal framework needs to anticipate problems in maintaining any trust in digital data/records/archives which are now under the control of entities suffering a waning level of confidence from the public, including legal, law enforcement, financial, medical, broadcasting, and governmental organizations and professionals, especially in light of the noted exponential growth of and reliance on Internet services. This could be done by means of “model legislation” that can be adapted to each national and cultural context. This model legislation would allow for a harmonization of provisions related to the proper control of our digital heritage from the moment of creation throughout its life-cycle so that it will be produced and maintained in an accurate and reliable way and its authenticity will be protected from the very beginning. A model legislation needs to be detailed enough to contain exemplary norms about specific issues presented by digital material, but general enough to be independent of technological changes, focusing on concepts rather than processes, principles rather than activities.

The only body which can take up the responsibility of writing this non-legally binding model law for the protection of the rights embodied in and exercised through digital documents, and which has the authority and the recognition for doing so is UNESCO. UNESCO can issue a model law as a recommendation, that is, as an instrument in which “the General Conference formulates principles and norms for the international regulation of any particular question, and which invites Member States to take whatever legislative or other steps may be required in conformity with the constitutional practice of each State and the nature of the question under consideration to apply the principles and norms aforesaid within their respective territories” (Article 1 (b)).” The UNESCO *Charter on the Preservation of Digital*

Heritage, whose purpose is to guide the member states in overcoming the challenges of digital preservation, as revised on the basis of the recommendations coming out of this conference, is the ideal contextual document for a model law. As its natural complement, a model law would guide the legislative bodies of the member states in ensuring the proper implementation of the Charter's general guidance through the issuing of domestic legislation. This conference is the time to start thinking what a model law should include. If not now, when?

Keynote: Digitization and Preservation

Global Opportunities and Cultural Challenges

Anne Thurston

International Records Management Trust

Abstract

As countries worldwide enhance their ability to operate in the digital environment, our societies have the greatest opportunity the world has ever known for preserving and sharing information and empowering citizens through access to information. There is a rapidly growing international awareness of the potential benefits but less recognition of what must be in place to realize them. The challenge is to articulate clearly the essential significance of authentic, trustworthy records as the foundation for transparency and accountability along with the risks of failing to address digital records management and preservation; and to share knowledge of good practice across the information profession as rapidly as possible.

Author

Anne Thurston has pioneered approaches to sharing solutions for managing public sector records with developing nations. Between 1970 and 1980 she lived in Kenya where she conducted research before joining the staff of the Kenya National Archives. In 1980 she became a Lecturer, later a Reader in International Records Studies at the School of Library, Archive and Information Studies, University College London. She established the International Records Management Trust in 1989 and continues to be its Director. In 1996 she left University College London to concentrate fully on the work of the Trust. In the 1990s, recognizing the impact of the rapid changes in the use of information technology on the management of public sector records, she structured the Trust to address the impact of those changes. Dr. Thurston was a member of the UK Lord Chancellor's Advisory Council on Public Records from 1994 to 2000. She was awarded an OBE for services to public administration in Africa in 2000 and a Lifetime Achievement Award by the Records Management Society of the UK in 2007. She was awarded the Emmett Leahy Award for Outstanding Contributions to the Information and Records Management Profession in 2007.

1. Introduction

UNESCO and UBC have achieved something extraordinary in convening this conference. Our societies have the greatest opportunity the world has ever known for preserving and sharing information and empowering citizens through access to information. It is the right time, and you are the right people to take this issue forward. As UNESCO notes on the conference website, digital information not only has value as a cultural product and a source of knowledge, but it is essential to sustainable national development as, increasingly, personal, governmental and commercial information is created in digital form only. Digital and digitized records are rapidly becoming the basis for citizens to exercise and protect their rights.

My work over the last 40 years has given me a context for examining these issues. I lived in Kenya for 10 years in the 1980s and joined the staff of the National Archives of Kenya. Later, I taught at University College London and conducted extensive research on the management of government records

in 32 countries worldwide. On this basis, I set up the International Records Management Trust,¹ which I have run for over two decades. The IRMT has worked in virtually all regions of the world but mostly in Africa, where we are committed to providing support to densely populated low-income countries, which we believe can benefit greatly from strengthened records management. Our three-pronged approach, which involves on-going research, consultancy, and development/ distribution of free educational material and assessment tools, has given us an overview of the challenges countries are facing worldwide.

The global wealth of expertise gathered at this conference is extraordinary. At the same time, the lack of high-level support for digital records management and preservation is a stark reality, with a massive widening gap between what is needed and what is being achieved. If the digital memory of the world, including that portion of the memory resident in government records, is to survive, we need to take a careful look at how we position ourselves strategically to bring about change.

UNESCO has challenged us to launch specific initiatives related to digital preservation, to foster access to documentary heritage through digitization, to identify legal frameworks that will facilitate long-term digital preservation, to agree on our approach to exchange standards, and to define the respective roles of professionals, academics, industry and governments in relation to these issues. These are excellent and necessary objectives, but to achieve them, we need to understand why digital access and preservation receive so little recognition and are so poorly funded in most parts of the world. How can we reverse this position? What are the priority development areas to which we can contribute? I believe that in addition to technical competence, we have to position ourselves to make our contribution in the context of the growing global emphasis on citizens' right to transparent and accountable government. In today's climate of limited funding, competing priorities and budget cuts, we have to demonstrate relevance to global needs.

2. Barriers and Challenges for Digital Preservation

In this presentation, I am focusing on government records and data, not because I am unaware of the importance of non-governmental cultural assets or of personal and commercial records, but because few societies invest in cultural preservation for its own sake: there must be practical and demonstrable benefits to the society. Preserving digital records as cultural assets and managing them as organisational assets must begin by addressing the weaknesses in the management of current records. Unless we are positioned close to the point at which the records are still being actively managed in the creating agencies, the records are unlikely to be available, understandable and useable through time. Ultimately, leadership and funding for preservation and access will come largely through governments and the donors and lenders that support them, but a number of crosscutting issues will have to be resolved.

2.1 Issue One: Digital Preservation Is Not a Development Priority

This is, I believe, the single most important issue that we must address. International donor and lender support is often a crucial factor in influencing national development priorities and an essential source of funding, but at present, digital preservation is not even on the radar of the global development community. Unless this changes, the money to pay for digital preservation and the structures needed to support it will not be available. Too frequently, digitization and business process automation are

¹ See www.irmt.org.

concerned only with the present, with little attention to the future. We need to help governments, donors and lenders understand that digitization and preservation are a fundamental part of the context of development.

2.2 Issue Two: Lack of Awareness

For the most part, development planners and government stakeholders are not yet aware of preservation and access issues, of the cost of the failure to address these issues or of what is needed to do so. They still tend to believe that technology will resolve the problems. The information profession has not yet spoken powerfully into the development process. We have not made it clear why and how our profession is such a crucial factor for social and economic development. Introducing Information and Communications Technology (ICT) is a major development goal in countries across the world. Government officials and development planners tend to assume that digital information will survive without intervention. They focus on the dramatic benefits of digital systems without considering the integrity of the digital information that these systems generate. Millions of dollars are invested in information systems, but records are not being captured in a form that will be intelligible, unalterable and usable over time. Government agencies have hardly begun to take responsibility for the records they generate.

2.3 Issue Three: Gaps in the Institutional/ Regulatory Framework

In many countries the combination of laws and policies, standards and practices, enabling technologies and qualified staff needed to ensure that digital records remain accessible and trustworthy are not in place. Legislation is often out of date or inappropriate, and conflicting laws tend to split responsibilities for government records or result in an absence of responsibility, so that no one is accountable. In many cases, international standards have not been introduced, and often planners don't know that they exist. There tends to be an absence of national information policies, and where policies exist, they tend to relate to paper records. Trusted digital repositories rarely exist, and digital records are often stored on various recording media in computer rooms or in rooms with poor environmental controls. In many cases, basic procedures and management controls for digital records management and preservation have not been developed and implemented, and there has been little planning for continued accessibility in the changing ICT environment.

2.4 Issue Four: There Is a Lack of Practical Capacity to Manage and Preserve Digital Records

Relatively few records professionals worldwide have had in-depth training and experience in managing and preserving digital records. University education programmes are beginning to address the issues, but the lack of practical expertise nationally tends to mean that education and training remain theoretical. Newly qualified professionals flounder when faced with the enormous challenges of turning theoretical learning into practical solutions.

2.5 Issue Five: Digitization Initiatives Can Fail Due to a Lack of Preparation and Standards

Digitization is a priority issue for many governments and international organisations as a quick means of making records accessible and ending dependence on paper records. Digitization projects fail or achieve limited results where the original paper records are poorly organised and international standards for

digitization are not recognized. Too often, the management and quality control framework needed to ensure that the digitized records meet requirements for legal admissibility, reliability and authenticity, and long-term preservation have not been developed. Requirements for image resolution, metadata fields, standardised indexes and classification structures, and retention and disposition schedules are often unrecognized. In some cases, agencies assume that hard copy source records can be destroyed as soon as digital copies are created; if the scanned image is poor or there are problems with accessing it, the agency and civil society are at risk. Where the organisation responsible for the digitized records does not have a digital repository and a digital preservation strategy in place, the digitized records are unlikely to survive in the long-term.

3. Consequences of the Current Situation

Meaningful citizen engagement in the digital environment requires on-going access to trustworthy, reliable and accurate records and datasets. If they are not professionally managed in secure technology-neutral facilities and supported by complete metadata, they are unlikely to be available to support citizens' needs. Unmanaged information can be manipulated, deleted, fragmented or lost, and records can become unreliable. Citizens cannot prove unequal or unjust treatment, delivery of justice is impaired, and human rights cannot be protected. Access to Information (ATI) requests cannot be met promptly or accurately. Data drawn from inaccurate and incomplete records can lead to skewed findings and statistics. Governments' ability to make decisions and achieve strategic priorities for economic and social development is seriously undermined. Misuse of information, cover up of fraud, misguided policy recommendations and misused funding all contribute to poor governance. Information technology projects are often not sustainable or do not reach their intended goals because records issues are not addressed as part of the planning and because implementation process and because data is not kept accurate and up to date.

4. Open Government: An Opportunity for the Records Profession

Over the last several decades, governments and donors have tried to improve the quality of governance through strategies and programmes for addressing poverty reduction, structural adjustment, democratisation, service and programme improvement, political regime stability, evidence-based governance, electronic government and anti-corruption. Records are essential for all these objectives, but the development community has not recognised their crucial significance. The Open Government Partnership (OGP),² launched in September 2011, offers a significant new opportunity for our profession.

The Partnership is based on the idea that governments exist for the benefit of the people; the people should have access to information about what their governments are doing so that they can hold them accountable and get the greatest possible advantage from government information. The Open Government Declaration, signed in September 2011, recognised that people around the world are looking for ways to make their governments more transparent, responsive, accountable and effective. This remarkable initiative, involving leaders at the highest political level, endorsed the principles of the Universal Declaration of Human Rights, the UN Convention against corruption and other instruments related to

² See <http://www.opengovpartnership.org/>.

human rights and good governance. To date, 57 countries have joined the initiative, 45 of which have delivered commitments and 12 of which are developing commitments. Moreover, Open Government is being discussed in many countries that have not applied to join the Partnership.

The transparency and accountability field is now one of the fastest growing public movements of recent years. It brings together a wide range of organisations and projects aimed at promoting greater openness on the part of governments, companies and other institutions so that the public can hold them to account. It represents a unique opportunity for the records profession because well-managed records, as evidence of government policies, activities and transactions, are the cornerstone of openness. I do not believe that the movement can truly succeed without our involvement.

At present, however, records barely feature on the Open Government agenda. Instead, Open Data has an increasingly high profile because it is an immediate way of making government information available. Open Data involves opening non-sensitive datasets as a way of promoting transparency, accountability and economic development. The US and UK led this movement initially, but Open Data is rapidly gathering momentum worldwide. In July 2011, Kenya became the first African country to launch an Open Data portal, releasing over 160 datasets including budget and expenditure data, as well as information on healthcare and school facilities. This has caused great excitement in the development community.

For all the excitement about the potential of Open Data, the fact remains that if governments are to prove accountable and achieve their economic and social objectives, and if citizens are to engage meaningfully with their governments in the digital environment, on-going access to trustworthy, reliable and accurate records and datasets is essential; data is only meaningful if it can be traced back to the records from which it is derived. There is a strong relationship between records management and government accountability, decision-making, service delivery and ability to achieve strategic priorities. Citizens and investors need to know they can trust the information that governments provide. When they make requests under Access to Information legislation, they have the right to expect that the information will be provided promptly and will be accurate and authentic. When datasets are released through Open Government portals, they have the right to expect that the data can be trusted. Only then can Open Data and Access to Information become true means of ensuring government transparency and openness.

We have an opportunity to raise the profile of records management significantly, with governments and with donors and lenders, if we can make the case clearly that records are the basis for successful openness and bring this issue onto the Open Government agenda. Getting records management into OGP country action plans that members are required to develop is a valuable opportunity to raise the profile of records management services, argue for greater resources and make a significant contribution to national and international development. Beyond that, we need to work with international partners to get records management and preservation onto the OGP agenda.

5. Bringing Records Issues Onto the OGP Agenda

The IRMT, working with the International Council on Archives (ICA) and the Transparency and Accountability Initiative³ in London, has begun this process. The ICA, as the international NGO dedicated to the effective management and preservation of records and archives, recognises the

³ See <http://www.transparency-initiative.org/>.

opportunity that Open Government offers for the records community. The Transparency and Accountability Initiative, which brings together philanthropic foundations, official aid agencies and civil society networks to promote innovation in transparency and accountability across many fields of international development, has accepted that records are fundamental to openness. This month, together we launched an initiative on Open Government and Trustworthy Records involving an international stakeholder assessment of a narrative and an assessment tool aimed at helping governments set direction for records management and preservation as elements of their OGP action plans.

The Assessment looks at the institutional/ regulatory framework and capacity in place at three levels of achievement. In the *initial steps*, the goal is to ensure that evidence of government decisions, actions and transactions is created, captured and managed in fixed and accessible form as reliable and authentic records, to underpin transparency and accountability. In the *more substantial steps*, the goal is to ensure that records management requirements are addressed in relation to Open Data/ Access to Information requirements and ICT/ e-Government initiatives, and that these requirements are integrated in the design of government business systems. The goal for the *most ambitious steps* is to ensure that proactive disclosure of records and the information and data derived from records is embedded in government processes and cultures, thereby promoting engagement between governments and citizens.

6. An Example of What Can Be Achieved: Norway⁴

Norway's initiatives in records management and digital preservation offer insight into what is achievable. The Norwegian model requirements for electronic records management systems were first introduced in 1984, and over almost 30 years, ongoing developments in the complexity of platforms, system portfolios and functionalities have been fused into a common standard for a wide range of applications.

The model requirements emphasise the direct relationship between quality at the point of creation and the ability to reproduce the records according to their original structure to show relationships and original context in a way that upholds their authenticity, accuracy and context. This is achieved by ensuring that everything is identified, labelled and coherently structured within the model requirements. Legislation narrows down the range of allowed file formats for transmission, and vendors may not sell electronic document and records management systems in the public sector without proving that their solutions comply with the model requirements.

One of the most striking aspects of the Norwegian approach is the awareness that preservation itself is not enough. From a historical perspective, access to archives does not have to happen quickly. However, if the material is needed because it contains important legal, financial, government based or rights-oriented information, it is important to reduce the time between creation and public access by users, including lawyers, courts, public bodies, researchers and individuals. The aim is to meet increasing citizen expectations for rapid, almost real time access to information and to make digital repositories a natural part of the digital environment.

⁴ This analysis is based on extensive communication with Olav Hagen Sataaslaatten, Assistant Director General of the National Archives of Norway. See Olav Hagen Sataaslaatten, "Does our ability to preserve and create future access to data depend ultimately on the quality of model requirements in its creational phase?" (poster to be presented at iPres2012, University of Toronto, October 1-5 October, 2012). See also descriptions of Noark 5, arkivverket.no/arkivverket/Offentlig-forvaltning/Noark/Noark-5/English-version, and of Norway's Electronic Public Records System, www.epsa-projects.eu/index.php?title=Electronic_public_records.

The Ministry of Government Administration, Reform and Church Affairs offers an Electronic Public Records System as part of the Norwegian Government's commitment to transparency and democracy within the public sector. Based on the Freedom of Information Act and related regulations, it aims to make the public sector more open to citizens. Central government agencies use this tool daily to publicise metadata about the records they create online so that users can identify documents relevant to their interests and submit requests to see them. The documents are provided within a matter of days. Within a few years from their creation, the National Archives of Norway receives these records from the ministries through a digital repository structure that meets TRAC and OAIS requirements and reduces the need for manual operations through standardised models for digital preservation. In 2011 when the National Archives developed a 'smartphone app' to enable public access to records and data direct from its repositories, the range of possibilities for information retrieval advanced to a new level.

7. Conclusion

At present, the lack of capacity, appropriate institutional/ regulatory frameworks and funding are substantial impediments to digital records management and preservation. So long as these issues have low priority, the situation will grow more critical as the volume of records in digital form increases substantially in coming years and the records from previous technologies age. Marginal increases in funding will not be enough to reverse the situation. As we examine initiatives for strengthening long-term digital preservation and consider the roles that different stakeholders need to play in this process, it is also crucial to position the information profession in relation to the global development context, particularly the Open Government movement.

We have a unique and essential contribution to make to international development, because we have the means of ensuring that digital information is protected and preserved in a trustworthy, authentic form. We have made tremendous progress in developing the concepts and tools needed to manage digital records, from strategies and standards, to laws, practices and technologies, and we have a powerful global network of information specialists. However, in order to make our rightful contribution, the profession will have to reposition itself, to move forward in new directions, to find new ways of sharing good practice and collaborating with new stakeholders. Government archives, for instance, will need to go beyond guidance and regulations to assume leadership and oversight. They will need to work actively, not only within the professional information community, including libraries and museums, but also with government stakeholders, including those responsible for Access to Information, Open Data, Electronic Government and audit.

Most importantly, the profession will need to focus on becoming relevant to citizens' needs. If we fail to do so, there will be significant losses for government accountability, economic opportunity, citizens' rights and the preservation of knowledge. This may begin with international bodies such as UNESCO and the ICA reaching out to new partners, with universities considering new joint programmes, with individual professionals opening new discussions across government agencies. The bottom line is that if we want to serve the world's citizens by protecting and preserving digital information, if we want the funding situation to change, we must change.

Intellectual Property Infrastructure Initiatives for Digital Heritage

Intellectual Property Rights & the HathiTrust Collection

Heather Christenson¹ and John P. Wilkin²

¹California Digital Library, University of California, USA, heather.christenson@ucop.edu; ²HathiTrust, USA

Abstract

Research libraries founded HathiTrust in 2008. This digital preservation and access collaboration of over 60 research libraries in the United States, Canada, and Europe utilizes a shared infrastructure to preserve digital copies of now over 10 million volumes digitized from print. HathiTrust's mission is "to contribute to the common good by collecting, organizing, preserving, communicating, and sharing the record of human knowledge." This paper introduces the goals of HathiTrust, describes the scale and scope of the HathiTrust collection and its significance, and discusses how the organization is providing services related to the digital collection, in light of changing conditions for maintenance of the participating libraries' print collections, and, in particular, in the context of the current environment for intellectual property rights.

Authors

Heather Christenson is Mass Digitization Project Manager at the California Digital Library (CDL), and Project Manager for the University of California's HathiTrust collaborative work. Ms. Christenson is responsible for coordinating operations across the UC Libraries' large scale digitization projects, and plays an integral role in planning for services surrounding digitized content. Prior to joining CDL, Ms. Christenson was involved in the development of commercial web search tools, and was a news librarian, law librarian, and cataloger. She received her M.L.I.S. from the University of California, Berkeley.

John P. Wilkin is the Associate University Librarian for Publishing and Technology at the University of Michigan, and is the Executive Director of HathiTrust. Mr. Wilkin provides operational and strategic leadership for HathiTrust, a growing international partnership committed to using digital collections to help libraries improve access and preservation strategies. In his role at the University of Michigan Library, Mr. Wilkin also leads publishing efforts, including the Library's pioneering digital publishing operations and the University of Michigan Press, and the Library's technology operations.

1. Introduction

Research libraries in the United States have been digitizing their materials for almost two decades, both individually and via collaborative projects. Digitization is expensive, and in the absence of an official national library program or long-term national funding, the libraries have accomplished the task of converting books to digital form in a number of ways: through partnerships such as collaboration with Google, grant funding, and self-funding. Unlike commercial enterprises, however, research libraries place a great deal of value on digital preservation, and in the provision of digital content for scholarly uses into the future.

Although the conversion of library materials from print to digital form has happened at a brisk pace, the law has been slow to evolve in terms of considering use of mass digitized library collections. Research libraries view as an imperative their traditional role as stewards of the record of human knowledge, regardless of format, so they must do their best in good faith to interpret existing laws, to act lawfully, and to act in the public interest.

In 2008 research libraries founded HathiTrust, a digital preservation and access collaboration of over 60 research libraries in the United States, Canada, and Europe. HathiTrust utilizes a shared infrastructure to preserve digital copies of now over 10 million volumes digitized from print. HathiTrust's mission is "to contribute to the common good by collecting, organizing, preserving, communicating, and sharing the record of human knowledge."¹ With partners that include libraries in major public and private colleges and universities, independent research libraries such as the Getty and the New York Public Library, and the Library of Congress, and a collection that is increasingly comprehensive, HathiTrust is rapidly becoming a central entity for preservation of and access to library collections. Any given HathiTrust partner library is likely to find more than 50% of its print collection online in HathiTrust. With such a large aggregate collection, the range of works in HathiTrust represents the full spectrum of research library collections, including the copyright status of materials in those collections. Consequently, the HathiTrust libraries must navigate current copyright law to practice responsible stewardship of library collections and to continue their service mission, in the digital realm.

This paper introduces the goals of HathiTrust, describes the scale and scope of the HathiTrust collection and its significance, and discusses how the organization is providing services related to the digital collection, in light of changing conditions for maintenance of the participating libraries' print collections, and, in particular, in the context of the current environment for intellectual property rights.

2. Goals of HathiTrust

Structurally, HathiTrust is not a "trust" in the legal sense of the word, nor is it a corporation or even a non-profit organization. It is a collaborative enterprise of research libraries that depends on funding and in-kind contributions from its members.

The name HathiTrust was chosen to reflect the values of the organization. Hathi (pronounced hah-tee) is the Hindi word for elephant, an animal that symbolically represents memory, wisdom and strength. In concert with its overarching mission, the initial goals set by the HathiTrust partners are:

- To build a reliable and increasingly comprehensive digital archive of library materials converted from print that is co-owned and managed by a number of academic institutions.
- To dramatically improve access to these materials in ways that, first and foremost, meet the needs of the co-owning institutions.
- To help preserve these important human records by creating reliable and accessible electronic representations.
- To stimulate redoubled efforts to coordinate shared storage strategies among libraries, thus reducing long-term capital and operating costs of libraries associated with the storage and care of print collections.
- To create and sustain this "public good" in a way that mitigates the problem of free-riders.

¹ http://www.hathitrust.org/mission_goals

- To create a technical framework that is simultaneously responsive to members through the centralized creation of functionality and sufficiently open to the creation of tools and services not created by the central organization.²

HathiTrust has values of openness and collaboration, and aims to be transparent in its governance and operations. In addition to digital preservation, the organization also aims to provide access to materials to the extent legally permissible.

3. The HathiTrust Collection

The HathiTrust collection has its origins in mass digitization projects conducted in partnership with Google and the Internet Archive, but incorporates much more. HathiTrust brings together collections from many major Google library partners, including the two largest, University of Michigan and University of California, and has the largest collection of items digitized by Google. HathiTrust has also gone a long way towards archiving digital volumes created during Microsoft's Live Search Books 2006-2008 project, volumes which were digitized by the Internet Archive and others. More recently, HathiTrust has focused on incorporating materials that have been locally digitized by the partner libraries. Although HathiTrust content primarily originates from libraries within the United States, the HathiTrust partnership includes international partners such as Biblioteca de la Universidad Complutense de Madrid in Spain, which has contributed a large amount of content, and McGill University in Canada. From its inception in 2008, HathiTrust has grown to include over 10.5 million volumes.

HathiTrust aspires to comprehensiveness and has used mass digitization to accomplish that goal. Consequently, HathiTrust does not have a collection development policy that requires the partners to adhere to any specific subject, language, or content criteria. The HathiTrust partner libraries believe that the value of HathiTrust is in the whole collection, and that this aggregation is reflective of research library collections selected for scholarly value and preserved over time in print by libraries. The aggregate collection also offers the opportunity for differentiation of specific digital collections from the whole, post-digitization, via a layer of services. For example, by aiming for comprehensiveness, HathiTrust is more easily able to offer up sub-collections like English language literature before 1800 or US federal government documents. The vast collection holds the potential to be curated and presented in a multitude of ways using tools available now or developed later. Like the research library collections encompassed within it, HathiTrust serves a broad constituency by incorporating works that did not top the best-seller lists but that serve the "long tail" activities of specialized research and scholarship.

The collection spans the gamut of languages in research libraries: more than 400 languages are currently represented in HathiTrust, of which the highest percentages of volumes are in English, German, French, Spanish, Chinese and Russian. Most languages are present in the collection in smaller percentages, but because the collection is so large, the percentages still represent large numbers of digital volumes, for example Indonesian (33,726), Norwegian (15,429) or Afrikaans (1,053).

² Ibid.

4. Significance of the Collection

HathiTrust serves as shared infrastructure for partner libraries to use in managing their print collections. The significance of a *preserved and dependable* collection of this magnitude is beginning to be appreciated. In early 2011, an OCLC Research study by Malpas reported results of an analysis of the HathiTrust collection relative to the volumes held by US research libraries in print, and found HathiTrust to be increasingly representative of the physical collections in research libraries.³ This holds a number of implications for the libraries in terms of greatly needed understanding of how much of what is held there has been digitized, and how much remains to be digitized; the costs to digitize the remainder cannot be determined unless we know the scale and scope of what is left.

If a given library can possess an understanding of how its particular collection maps to the digitized whole, and can rely on HathiTrust for preservation of digital versions of those books, the library can then make informed decisions about how and where to store its physical book collection, including which print books are essential to keep. When digital books are collaboratively made available, advantages can accrue through collaborative agreements for retention of the physical books, allowing libraries to reduce storage costs in the presence of widely available digital copies.

5. How HathiTrust Provides Services in the Context of the Current Environment for Intellectual Property Rights

The HathiTrust corpus includes millions of works, including both public domain and in-copyright books and serials. HathiTrust can store these works because US law places limitations on the exclusive rights of the rights holders, and those limitations support both fair use and preservation purposes. In order to provide access to the digital volumes in its collection, HathiTrust relies on US and international copyright law and rights determinations for the corresponding print volumes. For example, HathiTrust uses the publication dates and countries of publication in cataloguing records to identify large bodies of public domain works, and in many cases rights holders grant HathiTrust permission to provide open access to materials in the collection. The totality of the HathiTrust strategy can be characterized as a combination of automatic rights determinations, manual rights determinations, permissions and agreements, and legal interpretations.

5.1 Automatic Rights Determinations

HathiTrust's automated rights determination processes identify materials that we can reliably characterize as being in the public domain, either based on US law or common attributes of non-US copyright law. By analysing a number of fixed and free fields in the MARC record, we make a first pass at identifying public domain works, characterizing the remainder as presumptively in copyright. Although we are not able to exhaustively detail the criteria that we consider in making these determinations, several key examples will help illustrate the process. Most US works published in the United States before 1923 are in the public domain worldwide. US law defines the majority of US federal government publications as

³ Constance Malpas, *Cloud-Sourcing Research Collections: Managing Print in the Mass-Digitized Library Environment* (Dublin, Ohio: OCLC Research, 2011), <http://www.oclc.org/research/publication/library/2011/2011-01.pdf>.

public domain. US law also treats non-US works published before 1923 as public domain in the United States; consequently, HathiTrust provides open access to these publications for users coming from network addresses within the United States. To provide access to non-US works for users outside of the United States, HathiTrust generally relies on the Berne Convention⁴ as a framework for decision-making. In many countries, non-US works are only in the public domain 70 years after the death of the author, and because author death date information cannot be reliably inferred in the cataloguing record, we have created a “rolling wall” of 140 years before the current year. (This approach provides us with some protection against assuming a public domain status for a work where the author published a work at a young age and lived for an exceptionally long time). HathiTrust’s automated routines for determining the public domain status of works is published online on the HathiTrust website.⁵ Although the current decision-making framework is focused primarily on US copyright law, Canadian HathiTrust partner libraries have begun discussions to define specific exceptions found in Canadian copyright law.

5.2 Manual Rights Determinations

HathiTrust also uses a carefully defined set of procedures, systems and legal guidance to make manual rights determinations. With generous assistance from the Institute of Museum and Library Services, HathiTrust implemented a Copyright Review Management System (CRMS) in 2008. The design of that system was guided by and continues to be refined by legal scholars. It incorporates strategies such as double-blind review in order to increase the reliability of determinations. The reliability of determinations has been and will continue to be tested against benchmark data (e.g., record analysis by the US Copyright Office). The first CRMS work was focused on books published in the United States between 1923 and 1963; current work is focused on non-US books published in English-language speaking countries and Spain. The Copyright Review Management System is documented online.⁶ Additionally, legal experts may flag individual works for review. All manual decisions override automated decisions, and both sets of decisions are registered in a HathiTrust-maintained Rights Database. The architecture and decision-making related to the Rights Database is also documented online on the HathiTrust website.⁷ More than 100,000 works have been opened using manual determinations; roughly 55% of the works reviewed have been found to have a public domain status.

6. Permissions

Recognizing that many rights holders believe that open, online access to their publications is either part of their mission or in their best interests, HathiTrust supports several strategies for individuals and organizations to open access to their publications. HathiTrust makes a form available online so that the rights holder may convey perpetual and non-exclusive permission for access; this form supports many methods for access, including simple permission without changing the copyright status of work, and application of a Creative Commons license.⁸ Additionally, HathiTrust has negotiated agreements with

⁵ http://www.hathitrust.org/bib_rights_determination

⁶ <http://www.lib.umich.edu/grants/crms/>

⁷ http://www.hathitrust.org/rights_database

⁸ http://www.hathitrust.org/permissions_agreement

some rights holders (e.g., Duke University Press) where entire lists of titles are opened with a Creative Commons license, and, in return, HathiTrust provides files and updates to the rights holder. More than 7,000 works have been opened through explicit rights holder permissions.

Using this combination of strategies, HathiTrust has opened more than 3 million works for users at US network addresses, and more than one million works for users worldwide. This represents roughly 30% of the HathiTrust collection. The remainder of the HathiTrust collection, approximately 70% of the works, has either been determined to be in copyright through the CRMS process or is assumed to be in copyright, pending further investigation.

7. Other Lawful Uses of Digital Materials

HathiTrust has used legal guidance to undertake other strategies to provide access to works in the HathiTrust corpus. Rubrics such as fair use in US copyright law (or fair dealing in other regimes) provide a framework for some uses, and HathiTrust supports some of these. In addition, constituencies like the blind or other persons with print disabilities may be served under legal regimes like that in the United States. Similarly, some provisions of US law support HathiTrust's preservation mandate.

Under US copyright law, including the fair use provisions, HathiTrust has developed and provides a powerful discovery mechanism for the entirety of the corpus. Every word and phrase (in hundreds of languages and many character sets) in HathiTrust is indexed and searchable by users worldwide. Where HathiTrust has determined that a work may be made accessible to a given user, the search results provide a significant amount of context, and links are provided to the full text, which can then be read online. In other cases, either in the limited number of instances where we know the work to be in copyright, or where we treat the work as being in copyright in the absence of more reliable information, HathiTrust reports the page numbers and the number of hits per page to the user who conducts a search. This powerful search capability has been extremely helpful to many scholars, as it serves as a master index to a corpus of billions of pages.

Many legal regimes support use of in-copyright works for users with print disabilities. For example, the Chaffee Amendment to US copyright law, Section 121, allows an authorized entity to provide access to works that are protected by copyright to certain users.⁹ In addition, certain uses of in-copyright works to make them available to the blind have been determined to be fair use under US copyright law. The mechanisms HathiTrust has put in place are preliminary, pending the resolution of the legal challenges facing HathiTrust. Currently, using this framework, HathiTrust provides access to millions of works for University of Michigan users certified to have print disabilities. In each case, HathiTrust provides the authenticated user access to the underlying text through a special interface so that the user may use the text with a digital Braille or other reading device. Only digital copies of works that have been determined to be part of Michigan's print collections are included in the service.

Preservation-related provisions in law support other lawful uses of works that are in copyright. In US copyright law, Section 108 supports limited services when an in-copyright work is not available on the market in an unused copy at a reasonable price, and where the library's copy is damaged, deteriorating, lost or stolen.¹⁰ As with services for the print-disabled, the mechanisms HathiTrust has put in place are preliminary, pending the resolution of the legal challenges facing HathiTrust. Currently, at the

⁹ See, for example, <http://www.loc.gov/nls/reference/factsheets/copyright.html>.

¹⁰ See, for example, <http://www.law.cornell.edu/uscode/text/17/108>.

University of Michigan, HathiTrust provides access to certain damaged, deteriorating, lost or stolen works under this interpretation of US law, only to University of Michigan users. These University of Michigan users are not able to download the work in its entirety (i.e., they are currently only able to read the work continuously on the screen or to download one page at a time). No more than one simultaneous user per copy owned may view the work. Each work is clearly marked as being in copyright and the user is notified that access is supported under this interpretation of US copyright law.

As librarians, we must navigate a complex intellectual property rights landscape. Because of the importance and complexity of our work, our University counsels and other legal scholars guide us in making these decisions. Recent work by Peter Jaszi, Jennifer Urban, Pam Samuelson, and other American legal scholars has been helpful, but practical decisions for an organization like HathiTrust are largely untested. We hope, through the processes documented here, to build responsible foundations upon which other uses can be defined.

8. Conclusion

As a digital research library collection unprecedented in size and scope, HathiTrust serves an increasingly pivotal role. HathiTrust has become a vehicle to support end user access to the record of human knowledge and to support the preservation of library collections. Libraries have existed for hundreds of years, each building its distinctive collection with more or less complementarity to other collections. Now, through aggregation, libraries are using HathiTrust to explore questions of bibliographic identification, of collection management, and of copyright determination. Through this collectivity, libraries have begun to make strides in facing the economic and legal challenges inherent in the management and use of digitized library collections.

The Durationator® Copyright Experiment

Elizabeth Townsend Gard

Tulane University Law School, USA

Abstract

Copyright is a balance between copyright holders and the public, where copyright holders are given a limited monopoly but at its completion, the public is free to use the works as it wishes. But when does a work transition from protected by copyright to its new life in the public domain? That depends on the particular law of the country in which one wants to use the work. This becomes fairly overwhelming in a digital age. For the last five years, we have been creating the Durationator, a software tool that allows users around the world to input specific information about a particular cultural work and obtain legal information regarding the copyright status of the work—for the U.S., for specific regions, for the whole world. As more and more old works are saved, preserved and made available in a digital context, the need for such a tool becomes more urgent. Our project has researched and is in the process of coding the copyright law (in terms of duration) for every country in the world, including dependencies.

Author

Dr. Elizabeth Townsend Gard is an associate professor of law at Tulane University Law School, co-director and co-founder of Tulane's Center for Intellectual Property Law & Culture, and director and co-inventor of the Durationator® Copyright Experiment, a software program that determines the worldwide copyright status of every kind of cultural work. Since 2004, she has been a non-resident fellow at the Stanford Law School Center for Internet and Society. She, along with her husband, have begun the Copyright Research Lab and Help Center, which will offer low-cost self-help solutions to copyright questions

1. Introduction

One of the greatest challenges facing preservation and access research and development is copyright law: when are works in the public domain, when do library exceptions or fair use apply, when does state law apply (sound recordings, for example), how are foreign works to be treated, and which works can one post on the Internet without facing liability. These are just a few of the questions plaguing librarians, artists, scholars, teachers, corporations, the content industry, digitizers, students, hobbyists—everyone in a digital age.

The Durationator® Copyright Experiment tackles the question of when, how, and in what circumstances people (librarians, scholars, filmmakers, teachers, hobbyists, digitizers) can use cultural works.¹ We see the need for access to accurate, accessible, quick, and low/no cost solutions as key to work in the arts and humanities, to preserving the culture, and to bringing the old into the Internet Age, e.g., digitization. In the last five years, at Tulane Law School, we have devised procedures for determining the copyright status of a work worldwide. We have researched and coded the copyright laws of every country in the world. To date, only copyright experts in the field have seen the work. Starting in the Summer 2012, we began branching out to individuals and our strategic research partners to understand

¹ Tulane Law Students made a two-minute video about our project available at our website www.durationator.com.

how our raw research can be applied within specific settings—libraries, individual scholars, artists and filmmakers, publishers, digitizers, lawyers, and the corporate content industry.

The research for the project has been our main focus, and has been arduous, both in depth and scope. Many unexpected significant research questions had to be answered and that research then often had to be replicated in 200+ countries in the world. The research is never-ending but we find that we have developed a system to tackle these hard questions from which others shy away. Our project does not directly digitize works, nor does it create a database of public domain images. Rather, the Durationator® Copyright Experiment provides legal information for specific queries from users, who bring information about a particular work to the software tool.

The project began as a quest to understand U.S. law for domestic and foreign works, but it quickly broadened to include current law for every country, including dependencies in the world. Copyright may be territorial, according to the law, but the reality of our world is that we are all engaged in a global world. In the end, we hope our tool could be used in any instance to determine the copyright status of a cultural work, whether for a local or global use.

2. Copyright and Code

In January 2012, Justice Breyer, in his dissent of *Golan v. Holder* referenced my research and work with the Durationator® Copyright Experiment at Tulane University Law School. In explaining why copyright restoration of foreign works that had fallen into the U.S. was problematic, Breyer wrote, "...the statute's technical requirements make it very difficult to establish whether a work has had its copyright restored by the statute. Gard, In the Trenches with §104A: An Evaluation of the Parties' Arguments in *Golan v. Holder* as It Heads to the Supreme Court, 64 Vand. L. Rev. En Banc 199, 216–220 (2011) (describing difficulties encountered in compiling the information necessary to create an online tool to determine whether the statute applies in any given case)."² Personally, being cited by the U.S. Supreme Court is an important moment in one's career as a legal scholar. For me, it was particularly sweet, because our hard work here at Tulane University had been recognized in the most significant forum in law—the Durationator® Copyright Experiment had arrived.

I have been researching questions of copyright within a practical, real world scenario for seven years.³ I have come to believe that only code can make law accessible, and therefore, allow the average

user—everyone—to understand the choices we make when we post a family photograph on Facebook, choose to include a map in our scholarly publication, or decide which music to include in a documentary film. Our experiment at Tulane University attempts to use code to make available highly technical and difficult copyright law.

Can code make law accessible? In the 21st century, many laws have become so complex, particularly in an Internet age of multiple jurisdictions, that few average people can understand our laws. Lawyers themselves have trouble sorting through which laws apply, and if you have questions regarding copyright and posting works on the Internet, one could conceivably need to consult 220 different laws, for example, just to assure a work is in the public domain. Humans cannot perform this task. Code must come to our aid.

The Durationator® Copyright Experiment began as a research problem to a simple question: **can one determine the copyright status of a cultural work in the context of posting the work on the Internet?** Since no “Internet” copyright law exists, this meant to determine whether a work—a poem, novel, film, photograph, computer software—was either protected by copyright or free for all to use in the public domain—one must determine country-by-country the copyright status of that particular work. While the Berne Convention works to harmonize copyright laws, in fact, many differences appear, and some countries, including Russia, the U.K. and especially the U.S. are particularly complicated. After years of research and coding, we now know the copyright status of any specific work in each individual country of the world.⁴

3. Significance

3.1. The Durationator® For All Users of Culture

We believe that users of all kinds will benefit from legal information delivered in a form that is accurate, accessible, immediate, and at low/no cost. In short, the software was designed for my graduate self—an American worried about which British works I could use from a Canadian archive. It turned out that my worries were the worries of the world—from the Google Book Project and HathiTrust, both engaged in lawsuits over copyright infringement to the independent author writing a book on perfume history to the Disney studio engaged in negotiations over the rights of *Bambi*.⁵

We have worked with a number of different individuals and groups over the years—and we have found that whether it is Electronic Frontier Foundation, a movie studio, University of Michigan, an

Amour (Oxford University Press, 2010), 155-172 (invited piece and published); W. Ron Gard and Elizabeth Townsend Gard, “The Present (User-Generated Crisis) is the Past (1909 Copyright Act): An Essay Theorizing the “Traditional Contours of Copyright” Language,” *Cardozo Arts And Entertainment Law Journal* 28 (2011): 455-499; Elizabeth Townsend Gard, *Introduction to Shirley Millard’s I Saw Them Die* (1936, reprinted Quid Pro Books, 2011) (invited; introduction to public domain work in the U.S.); and Elizabeth Townsend Gard, “Unpublished Work and the Public Domain: The Opening of a New Frontier,” *Journal of the Copyright Society of the U.S.A.* 54 (Winter 2007).

⁴ We also know the copyright status of any work within historical time for about ten jurisdictions. That is, if you were living in 1799 in the U.S., would that particular painting, for example, have been under copyright? In 1840? 1910? We found the historical paths, as we call it, as important as current law, and have spent a good deal of time with Russia, Germany, Israel, Japan, China, France, the United Kingdom, the Berne Convention itself, and are working on other countries. This requires an understanding of case law, statutes, amendments, historical works, and custom.

⁵ *The Authors Guild v. Google*, 770 F. Supp. 2d 666. *Authors Guild v. HathiTrust*, Complaint SDNY. *Twin Books Corp. v. Walt Disney Co.*, 83 F. 3d 1162.

independent scholar, a book publisher, or a graduate student, the Amistad Research Collection—the same questions arise. All of these groups want to know the legal status of the work—what they can and can't do with a particular work. Their expertise in copyright may vary. But their needs and questions are consistent. To that end, we have developed a couple of strategies. First, the Durationator® itself will eventually be available to the public, with a no/low-cost version available. In the meantime, we are developing a business model that combines DIY Copyright Coaching (legal information) with one-on-one legal advice with an attorney. Finally, we will provide Durationator® Reports, Auditing Services, and Consulting as full-service legal advice as well. The research will continue to be done at Tulane Law School. The spinout services and products will be housed at Limited Times, L.L.C.

3.2 The Durationator in Libraries and Digitization Projects

3.2.1 Libraries

We believe the Durationator® Copyright Experiment will provide a valuable solution to daily copyright problems in the library by helping to determine if a particular item can be added to a digital archive, used by a researcher with or without restrictions, or transmitted electronically to remote users. In the age of electronic communication, users are requesting to have materials available electronically at an ever-increasing rate. Most librarians however, are reluctant to reproduce material that could still be under copyright protection. The Durationator® Copyright Experiment will provide librarians with a simple method for determining the copyright status of the research materials their users need most and make digitizing unique or historic collections far simpler.

Additionally, a strange disconnect occurs. Libraries digitize and post works, and look to the copyright questions for their own liability issues. We have seen broad categories being applied, a generalization. But for the user coming to that work—to include in a book, a movie, on a website—we must actually *know* the copyright status. We are not, as users, protected by the library's assertion "no known copyright restrictions." The Durationator can bridge the gap. It can take the information provided by the library and provide a tool for users to do a specific legal search related to that specific item. More certainty.

We also see the need for the Durationator® with archival materials, especially in their non-digitized state. Making use of valuable primary source materials in library special collections will be far simpler with the help of the Durationator®. A Durationator® search results report could be attached to the record of items in a library's special collections, allowing users to immediately know which works they could freely use in their research and which would need permission. Upon seeing the attached search results, researchers would also learn about the Durationator® and would know to use the service if they had further questions about additional materials they encounter throughout the research process.

In Interlibrary Loan, libraries could perform a Durationator® search on any item lent to another library before shipping the item through the mail.⁶ If the work is no longer under copyright protection and is often requested, digitizing the work and sending a digital copy in the future will save time, money, and the environment by cutting down on shipping costs and eliminating the risk of damage in transit. For academic libraries, copyright issues are a major concern for administering electronic course reserves

⁶ See the recent decision in *Cambridge University v. Becker* (delivered by the district court on May 11, 2012) regarding interlibrary loans at Georgia State. The 350 page opinion brings home the issue of copyright's role in libraries' daily activities.

systems. With the help of the Durationator®, librarians and professors could identify which works require permission and take affirmative steps to ensure that copyright law is observed while still making the work available for students.

Finally, the Durationator® Copyright Experiment will contribute to raising awareness of copyright issues for libraries and their users and allow historians, hobbyists, educators, and researchers to feel confident that they are complying with the law in their own work. By providing access to Durationator® searches for library materials, libraries can promote the use of their collections confidently and responsibly, making valuable research materials more accessible to all.

The Durationator® Copyright Experiment has formed strategic research partnerships with Louisiana libraries to assist in testing and adapting the product to serve the many needs of the library community—through LOUIS, the Louisiana Library Network, MediaNOLA, and the Amistad Research Collection at Tulane University. In addition to the librarians with copyright expertise who are serving on the Copyright Advisory Board (Kenneth Crews and Peter Hirtle), Tulane law student and former Access Services librarian Kathryn Munson has also been recruited to the product development team as the Director of Library Research to meet the needs of this unique service group, and will serve as our Director of Library Research and Outreach.

3.2.2 Digitizing Projects

Digitization projects—in libraries, by corporations like Google, and by hobbyists—abound. Moreover, litigation regarding copyright infringement over digitization projects raises the profile of the need to determine properly the copyright status of the many millions of works being digitized.

We think the Durationator® Copyright Experiment could assist with digitization projects, both large and small scale. We also realize that just because a digitization project has determined a work is in the public domain—say, as part of the proposed Google Book settlement—does not mean that a user can depend or receive benefit from the safe harbour provisions that Google receives. This means that a user using a Google book *should run their own search*. If accepted, Google will not be penalized if they get the answer wrong, but users using a particular work, could be.

We also believe there are more works to be digitized beyond books. To date, the majority of the projects have focused on either books (the easiest category to determine) or pre-1923 works (again an easy category). We want to encourage the many other layers of culture that remain underutilized because of the difficulty of determining their copyright status. We’ve worked with Quid Pro Books to help uncover previously unknown public domain books, including the republication of Shirley Millard’s *I Saw The Die*. We are also now working with University of Michigan as an independent third-party auditor of their large-scale project to determine the copyright status of thousands and thousands of books. University of Michigan’s library has become one of our Strategic Research Partners in determining the copyright status of foreign works, and also serving as an outside auditing system for their work.

3.3 Understanding Current Litigation and Copyright

Three major cases have involved cultural works held in libraries and their availability and access in a digital context: Google Books and the Proposed Settlement (that was rejected by Judge Chin), the Author’s Guild v. HathiTrust litigation over making available “orphan works”, works still under copyright but whose authors cannot be located to give permission, and Cambridge University v. Becker, regarding course materials in a digital context at Georgia State. Each of these cases has at their core what

libraries can and cannot legally do with works, and this depends on copyright status of each individual work. The Durationator® Copyright Experiment has watched this litigation storm with great interest. If the Google Book settlement is approved, Google will have a safe harbour on “mistakes” they make in determining the copyright status of works (labelling works in the public domain when they are actually still under copyright). However, users of the Google books will not have the same protection, nor will Google’s determination of the copyright status of the work be good for anyone but Google. The settlement does not allow users to legally depend on the analysis performed by Google. We think the Durationator® will be needed more than ever if the settlement is approved. What is clear from this litigation is that libraries, scholars, and others in the humanities are not immune from litigation, and a tool like the Durationator® is needed more than ever.

4. A Personal Context for Creating the Durationator® Copyright Experiment

My own journey with copyright began in 1987, when I first encountered what would become my dissertation subject. While taking an undergraduate course in the Culture of War, I was assigned the Great War diaries of British writer, Vera Brittain (1893-1970). The next week, another student presented Brittain’s memoir on the same time period, and I remember the stark differences in interpreting the same events, with the student actually accusing me of getting the events all wrong. I was encouraged by the professor (later my dissertation chair) to write a seminar paper on the two works, my undergraduate honours thesis on Brittain’s larger transformation, my master’s thesis on Brittain’s interwar years, and my dissertation as a comparative generational biography, with Brittain as the focus but in comparison to other men and women writers of her generation.

The broadening of my dissertation from merely a study in Brittain was due to copyright questions arising from the Brittain papers, and whether Brittain’s literary executor (also writing a biography at the time) would give permission to publish. Diversifying solved the problem, and also proved a more interesting project. But I found myself exposed to the uncertainty of copyright and how it affected my daily work. Could I use a 1917 unpublished letter?⁷ How was this different than quoting from the published version?⁸ Who did I need to ask permission from to use a particular photograph, clearly not taken by the Brittain family, and did one always have to ask permission or could I actually rely on fair use? What did it mean when a work went into the public domain, and how would one determine if that had occurred? I loved all of the materials I was encountering, but I felt unsure about what works I would actually be able to use in a publication, and what restrictions I might face from a literary executor.

At the Centenary conference for Vera Brittain, where I presented my work on gender and generational theory, I began hearing more and more stories from Brittain scholars of the difficulty of getting permission to publish from the current literary executor, who was writing his own biography of Brittain. The warnings would have scared any young graduate student. I also started to hear stories from other scholars in history that had abandoned projects for fear of getting entangled in uncertain legal status

⁷ The unpublished portions of the letter are in the public domain in the U.S. However, the published portions of the same letter are under copyright through December 31, 2047. 17 U.S.C. 303(a). At the time I was working on the project, however, the entire letter was under copyright in the U.S.

⁸ It turned out that the published memoir was in the public domain in the U.S. while I was a graduate student, but was “restored” by a complicated part of the copyright law in 1996. *Golan v. Holder*, the recent U.S. Supreme court case addressed this issue. I have spent a good deal of my career focused on “restored” foreign works, both within my research and the implementation of the statute in the Durationator®.

of works, and having nowhere to turn. Then, only in my early-twenties, I turned to my father, who, like all of the men in my family, was a lawyer. He took me to a law library in Los Angeles, which opened a whole new world, changing my path forever. For it was here I found and began to research the legal doctrine of fair use, copyright term, and other elements that have now come to dominate my life.

Upon completing my doctorate in May 1998, I enrolled in law school the following fall.⁹ I wanted to find answers to the questions that haunted not only my work but also others' I had encountered during my graduate work. It was also at this time, in the mid-1990s, that faculty began asking themselves what could they post and include on this new idea of a "web page" for courses, and like the materials of scholarship itself, no one seemed to have reliable legal answers on which to depend. I set out to understand copyright within an academic setting, and forge my own path as an advocate for scholars and teachers.

After completing my law degrees at University of Arizona, I was offered a Leverhulme Fellowship at the London School of Economics, to pursue research on copyright issues affecting academia, and to teach copyright (UK and International). There, I began to realize that the issues I had seen in my doctoral work had a distinctly important international component, and was broader than merely my own struggles as an academic writing 20th century biographies. The whole world seemed to have the same questions: when could they legally use a particular work? By 2005, the world, once analogue, had become digital, and copyright law, which was structured on a 19th concept of territory, now had to adapt those concepts to an instantaneously global world. My small questions of which works could she use in her dissertation now had global dimensions.

The postdoc led to a Visiting Assistant Professor position at Seattle University in 2006, and a tenure-track position at Tulane University Law School in the Fall 2007. It was in the Summer 2007 that the Durationator® Copyright Experiment was born. Two events occurred. A rising 2L law student with computer coding experience came to work for me, and an unsolicited email arrived asking if it was legal to use a Vera Brittain poem from 1918 as lyrics to a new musical composition—that is, was that poem in the public domain? As part of my research and job talk that year, I had been working on a piece on copyright and the public domain, and in particular the status of unpublished works. I knew the answer would be complicated. I didn't realize how complicated. After a number of months of research, I had the answer. I also realized that the system in place made it nearly impossible for anyone—trained in law or otherwise—to actually determine the copyright status of works. The idea of a software tool had been born. I always knew that I, along with my spouse (also a J.D./Ph.D.), had wanted to start a clinic or outreach program to assist scholars, students and teachers. Now, I wanted to make the copyright status of every work ever created—anywhere in the world—available.

Every work has a particular term of protection, and then after that term expires, all can use the work without permission. The work is in the public domain. The legal question I sought to answer: when did that occur—in the U.S., in the U.K., by posting it on the Internet, by disseminating it in Spanish-speaking countries, by making it available to the world? I knew it would not be an easy question—my brush with comparative copyright in the UK had taught me quickly how complicated international copyright issues could get. But with my 2L research assistant, we set out to research and code the world's copyright laws, and to answer the question: when does any particular work come into the public domain? We naively

⁹ I actually hid this information from my doctoral chair until I completed my first year. It was the biggest secret I ever kept. He had been so supportive since my late teens and my first discovery of Brittain. I didn't want to disappoint him in my divergent path, but I also felt compelled to know the answers in my quest.

thought it would take a summer. After five years, we have finished Phase One of the project, and we are now on to Phase Two, making the information and access to help available to the public.

Along the way, one more important element occurred...I found an intellectual community that supported and cared about the work that I was doing. It has been a whirlwind of exciting activities over the last five years—far more than I ever dreamed in my pre-tenure life. I've met, shown my work, shared meals, and been encouraged to continue the Durationator® Copyright Experiment by individuals I never dreamed I would even meet—David Nimmer (Nimmer on Copyright), Bill Patry (Patry on Copyright, Google Senior Copyright Counsel), Paul Goldstein (Stanford), Jule Sigall (Microsoft Senior Copyright Counsel), Peter Jaszi (American University), Pam Samuelson (U.C. Berkeley), David Carson (U.S. Copyright Office), Diane Zimmerman (NYU), Graeme Dinwoodie (Oxford), Daniel Gervais (Vanderbilt), Tony Reese (Irvine), Kenneth Crews (Columbia), to name just a few. Together, this group comprises some of the smartest folks on copyright in the U.S., and in particular duration, the public domain, and international issues. Each of them have sat with me, talked with me, and even reviewed what we are doing on the project. They all have not only been encouraging, but they most have agreed to act as our Copyright Advisory Board, which includes being part of our alpha prototype testers. This is what makes our project so unique. It is an academic working to find answers for other academics and productive users of cultural works researched by a law professor in a culture where other law professors intellectually support the work at hand. It has been the most amazing experience.

For all of this, I have stayed true to the project, and thanks to Tulane University's support, have been free to develop the mission and goals free from outside restraint or pressure. I want the software to help my old self—the graduate student wanting to know which works I had to ask permission from the literary executor, which works might qualify for fair use, and which were in the public domain. I don't want others to have to go to law school, spend five years and thousands of student research hours, and over \$100,000 in university funding to find the answer. I want DIY services that will help train those interested in self-help, while at the same time also providing them resources to legal advice. I want, in the end, to help the world determine the legal status of our cultural treasures.

The project has benefited greatly by the dedication and devotion of so many law students over the years. They have been amazing, individually and as a group. The work, ideas, and intellectual decisions they have all made make the software that much better. They have been my colleagues, and I have watched each of them grow in tremendous ways. It has been one of the great joys of the project—to see their leadership and research skills grow, and then to see them transition into their own careers and interests. We have had over three dozen students work on the project—and I've seen them grow and develop as well. It has been one of the great blessings of the project.

One more component significantly added to the support and success of the project: my spouse, W.R. Gard. First, he was willing to move many times, even when it was not in his best interest and his career—a trailing spouse is never easy. For that I am insanely grateful. The opportunity to work in a comparative and internationally focused law school at Tulane Law School presented itself to me, and he was willing to take a lesser position at a neighbouring school, instead of going on the market himself. But many spouses sacrifice. It was during dinner conversations that the essence of the project developed, and our method for figuring out how to move through the system took shape—for it was his theoretical work that changed the way we move through the U.S. law. We have co-authored a number of papers on this topic, but essentially, it was only in applying a Marxist reading comparing the turn into the twentieth century with the turn into the twenty-first century in both the culture and the law protecting culture that we came to realize key elements of the system. His theoretical work, his own development of a theory of

reading, has deeply influenced the shape and success of our project. Finally, he has been willing to take on significant responsibilities, including becoming the sole managing-member of our Tulane spin-out company, Limited Times, LLC.

Part of Ron's work focuses on the development of the corporation, and how this influences who we are as people—how the 19th century corporate form, the 20th century corporate form, and the 21st century corporate form deeply affects how we live, love, and physically live in the world. His doctoral and post-doctoral work focuses on developing a theory of reading the corporation through literature and film, using human geography, Marxism, and literary theory. Part of my own struggle with the idea of a spinout company was where we fit within the larger world, and how we stay true to our project. Ron has taken on that struggle, both in form and substance. The LLC, as we envision it now, will remain a closely held corporation, so that we can control its meaning and message. We will offer what we yearned for ourselves so long ago as graduate students—a place where we could learn how to understand the laws ourselves, and empower us to make thoughtful choices. This is what Limited Times LLC will do, and again, thanks to Ron, we will be able to see our vision come true. We want a project that can sustain itself financially, making sure that it can continue to update the technology and the law of every country in the world.

5. Major Research Questions Underlying the Durationator® Copyright Experiment

In developing the software, we have had many, many research hurdles that often have turned out to be very, very, very difficult and time-intensive queries—whole projects onto themselves. Many of these have become paper(s) in their own right, and we will continue to expand the research necessary to understand the state of duration and access in copyright law worldwide. In short, copyright duration is complicated on many levels.

First, within the U.S. context, the records needed to determine the copyright status of works published before 1978, until recently had not been digitized, and therefore were inaccessible to most. Even if one could get their hands on a copy of the Copyright of Catalogue Entries in one of the regional depositories, the extensive records are not intuitive, and their organization changes over the years. We worked a great deal with the original records to try to understand how to determine the copyright status of works, and where the average user would have trouble figuring this out. Now that they are digitized, one has access, but because all but the book records remain in scanned form only and not in a searchable database, their level of inaccessibility remains. I was told by someone at Google that they were working on the problem, but with no known date of releasing the records in database (XML) form, as they did with the book records. This is a very serious problem—as these records tell you whether a work was registered or renewed, was published or unpublished, foreign or domestic, and under what category they were registered—all valuable information needed to determine the copyright status of pre-1978 works in the 21st century.

We also encountered problems with legal questions regarding publication, government employment records, sound recordings, the status of state government works, and foreign laws necessary for determining the copyright status within the U.S. Each topic has turned into a major research project (involving many students) and eventually into research paper(s) the results of which are coded and incorporated into the Durationator® Copyright Experiment.

Our greatest hurdle was Section 104A, and it is this work that Justice Breyer referred to in his dissent in *Golan*. Section 104A restored copyright to foreign works that had fallen into the public domain before their copyright had expired in their home country. How the amendment went about doing this was

problematic on many levels, and to that end, I've been writing in one way or another on this topic for the last three years.¹⁰ Moreover, we had to research each country of the world to determine the copyright status of their laws at the time of restoration (which varies depending on the country), which itself proved very problematic, as most countries have altered their laws in the last ten years, and moreover, the old laws are not very accessible as they are generally from a pre-Internet era. I have had three students over three summers devoted to this project, and we believe, that by January 2013, we will have finally the data to complete our Section 104A path.

But Section 104A will surely be matched by our newest project—the rule of the shorter term. This is a complicated part of the Berne Convention that states that a term of copyright can be shorter if the country of origin's term is shorter than the country's term where protection is being sought. The problems are many. First, a country must elect not to adopt Rule of the Shorter (RST) term. Second, Berne may or may not be self-executing, and therefore, some countries may explicitly not adopt RST, but it would only apply if Berne were self-executing. Third, Berne has a component that exempts RST if there is a bilateral or other treaty in place that speaks to the issue. And so, as we have done before, we must now determine all of these elements for each country in the world. I began to see the problem when I was training a law student new to the project. We were doing research on Zimbabwe, and we got to the question regarding Rule of the Shorter term. No mention was made in Zimbabwe's copyright law. The next question we faced was whether Berne was self-executing or required implementing legislation. We soon realized that whether Article 7 of the Berne Convention applied in any particular situation was very complicated and required extensive research. We think this will be our larger Summer 2013 project.

Foreign laws are not the only challenges we faced. Pre-1972 sound recordings are covered by states rather than federal law. We have worked extensively on mapping each state's laws, and also contributing our comments and suggestions to the U.S. Copyright Office's call for comments and replies in the proposition of federalizing pre-1972 sound recordings. State government works are also complicated, and we are beginning to research how to determine when a state or local government is asserting copyright. Finally, federal government works are no picnic either, requiring a great deal of research. While federal government works are in the public domain, determining what counts as a federal government work involves questions of whether a work falls under the scope of a government employee's employment, among other issues. It's complicated.

The project has also worked on unpublished works—the research in fact is where the project began, and we have now begun working on implementing our research in a practical setting, using the MediaNOLA and courses at Tulane University implementing archival materials as our laboratory. What information does someone using archival materials have at hand, and how can we determine the copyright status using those resources? We are trying to make our research as accessible and error-proof as possible.

We have many other projects—one on social media and copyright, another on the U.S. Holocaust museum and its agreements with museums around the world, historical case studies of copyright in Germany, Israel, China, United Kingdom, Australia, and Japan, and a number of studies focusing on the

¹⁰ The majority of Dr. Townsend Gard's research work has focused on Section 104A, the restoration of foreign works. The first piece looked at the mechanics of the amendment; the second piece (invited by Vanderbilt) looked at the briefs leading up to the oral arguments for *Golan v. Holder*; the third piece analysed the lack of First Amendment analysis in what was billed as First Amendment cases (*Golan v. Holder*, and also a patent case); the fourth piece compares Ginsburg's outcome in *Eldred* with her writing in *Golan* and asks where do we go from here; and the final (hopefully) piece is an invited piece from Franklin Pierce on the relationship of the treaty clause and the IP clause after *Golan v. Holder*.

1909 Copyright Act. All of these projects, and future projects, hope to add to the knowledge base contained within the Durationator® Copyright Experiment.

6. Our Partners and Advisory Board

6.1 Copyright Advisory Board

The board functions to assist in advice with complex research questions (i.e., Rule of the Shorter term interpretation), testing of the alpha prototype, and in particular, reviewing our plans for future research projects. They will also assist in helping us strategize on the final plan for dissemination and sustainability. All of the following IP scholars and practitioners are familiar with our work, and in particular, the Durationator® Copyright Experiment. Some have been involved more than others. Each have seen the Durationator® demonstrated.

- Pamela Samuelson, Professor of Information; Faculty Director, Berkeley Center for Law & Technology; Richard M. Sherman Distinguished Professor of Law
- Peter Jaszi, Professor of Law, Faculty Director of the Glushko-Samuelson Intellectual Property Clinic
- David Nimmer (Nimmer on Copyright)
- Graeme Dinwoodie, Professor of Intellectual Property and Information Technology Law
- Daniel Gervais, FedEx Research Professor of Law
- Peter Hirtle, Senior Policy Advisor, Cornell University Library
- Kenneth Crews, Director, Columbia Copyright Advisory Office
- Tony Falzone, formerly Stanford University Fair Use Project, now counsel for Pinterest
- Julie Samuels, Electronic Frontier Foundation
- Glynn Lunney, Tulane University
- Alan Childress, Quid Pro Books
- Jule Sigall, Microsoft
- Deborah Gerhardt, University of North Carolina School of Law

6.2 Strategic Advising Partners

Over the years, we have worked directly (EFF, Stanford Fair Use) or had discussions about the Durationator® with the following institutions, and we would include them in our discussions on how to make the software accessible and useable to the general public.

- University of Michigan, Copyright Review Management System – World Project
- Stanford Law School Fair Use Project
- LOUIS: Louisiana Library Network
- Amistad Research Center, Tulane University
- Jazz Archive, Tulane University
- Newcomb Special Collections, Tulane University
- Louisiana Special Collections, Tulane University
- Konomark and Dr. Eric Johnson, University of North Dakota
- MediaNOLA and Dr. Vicki Mayer
- Quid Pro books and Dr. Alan Childress

Our work at Tulane and Media NOLA focuses on how to communicate what information is necessary to users to determine the copyright status of works—how does one quickly educate a class in architecture on how to use and determine the copyright status of works in a particular architecture archive? Our work with Quid Pro Books assists Dr. Childress in providing legal information on specific works he is interested in republishing. We are testing out our auditing services with the University of Michigan, and testing our software with LOUIS. In the next year, we are actively looking for additional strategic research partners as we transform our experiment into usable tools and forms. In particular, we would like to find partners outside of the United States to begin understanding the needs outside of the U.S. We have learned so much from questions from individuals and institutions, and we look forward to expanding our scope and learning a great deal more.

6.3 Testing the Delivery of Information

We are now entering into a new phase—how are we going to deliver the information provided by the research and code we have created? To this end, we are working on a number of alternatives, the successful ones that will be available at Limited Times in the near future. We have come to see our role as providing legal information and support to individuals and institutions struggling with copyright questions, and when necessary providing resources for legal advice. Even this required a great deal of legal research—to understand the line between legal information and legal advice (creating an attorney-client relationship), particularly after Legal Zoom and the new development of cloud lawyering sites. We are working on a model that meets the requirements of laws currently, and takes advantage of the new ideas about delivering legal information and legal advice in the digital era.

7. What We Have Learned – Our Journey Ahead

The journey so far has been exhilarating. I never imagined my copyright problems as a graduate student were also the problems of so many around the world. I also never imagined that I would lead a team of three dozen students into complex research and build a practical tool. I never imaged that I would be involved with so many people doing so many interesting projects. I never thought I would be starting a company with my spouse, focused on our passion of making cultural works more accessible. I certainly never even dreamed I would be cited in a Supreme Court opinion (even if it was the dissent). I love the research and work in all its complexities. And now that we are connecting to others and trying to figure out how to help them with their version of the same problem, it has become all that more interesting.

The Intangible and the Digital

Participatory Media Production and Local Cultural Property Rights Discourse

Kate Hennessy

School of Interactive Arts and Technology, Simon Fraser University, Canada, <http://hennessy.iat.sfu.ca/>

Abstract

The 2003 UNESCO Intangible Heritage Convention specifies that communities are to be full partners in safeguarding efforts. Yet the notion of safeguarding has been complicated by the politics and mechanisms of digital circulation. Based on fieldwork in British Columbia and Thailand, I show that participatory productions of multimedia aimed at documenting, transmitting, and revitalizing intangible heritage are productive spaces in which local cultural property rights discourses are initiated and articulated. I argue that digital heritage initiatives can support decision making about the circulation—or restriction—of heritage while drawing attention to the complexities of safeguarding in the digital age.

Author

Kate Hennessy is an Assistant Professor specializing in Media at Simon Fraser University's School of Interactive Arts and Technology (SIAT). As the director of the Making Culture Lab at SIAT, her research explores the role of digital technology in the documentation and safeguarding of cultural heritage, and its representation and exhibition in new forms. She has been a lecturer in the Sirindhorn Anthropology Centre's annual Museums and Intangible Heritage Field School in Lamphun, Thailand, since 2009.

1. Introduction

In the last decade, I have worked on applied projects in visual and media anthropology in Canada and Thailand. In the course of this work, I have come to view participatory media production as central to ethical digital documentation and representation of culture, languages, and heritage. In this same period of time, UNESCO produced the *Convention for the Safeguarding of the Intangible Heritage*¹ and the *Charter on the Preservation of the Digital Heritage*.² Both of these policy documents have become important for thinking through a range of local practices and approaches to documenting and representing intangible heritage in the name of transmission to future generations. These documents, and my fieldwork experiences, have for me also highlighted local approaches to ownership and control of cultural heritage and its digital representation—what I discuss in this paper as *local cultural property rights discourse*—as central to the project of safeguarding.³

For example, between 2004 and 2007, I worked in collaboration with members of the Doig River First Nation, a Dane-zaa community in northeastern British Columbia, and a team comprised of folklorists, anthropologists, linguists, and interactive media specialists, to produce a Virtual Museum of

² UNESCO, *Charter on the Preservation of the Digital Heritage*, 2003

³ This paper summarizes arguments from a forthcoming article: Kate Hennessy, "Cultural Heritage on the Web: Applied Digital Visual Anthropology and Local Cultural Property Rights Discourse," *International Journal of Cultural Property* (forthcoming).

Canada exhibit called *Dane Wajich—Dane-zaa Stories and Songs: Dreamers and the Land*.⁴ This virtual exhibit features oral narratives and song traditions relating to the history of Dane-zaa dreamers, also known as prophets,⁵ and a contemporary history of the Doig River community and territory as they negotiate their Aboriginal and treaty rights. In the course of producing this exhibit, which involved central participation of youth, elders, and community leaders, significant conversations emerged around the ownership and circulation of documentation of intangible heritage. The ensuing negotiations over intellectual property rights relating to archival documentation of intangible heritage, including what could be shared over the internet, and what should be restricted as private knowledge, represented an important process of articulating local cultural property rights that shaped the content of the virtual exhibit. Safeguarding, in this case, included keeping some elements of intangible heritage documentation out of the public domain.

I have also seen these dynamics echoed in fieldwork in northern Thailand. Between 2009 and 2011, I worked as a lecturer and resource person in the Sirindhorn Anthropology Centre's Intangible Heritage and Museums Field School in the northern province of Lamphun.⁶ In two of these field school seasons, I collaborated with students and members of the Buddhist temple community of Wat Pratupa to identify and document elements of endangered intangible heritage. We observed that at Wat Pratupa, digital media and internet-based circulation of documentation have been central in local efforts to safeguard local cultural practices. Like community-based media projects at the Doig River First Nation, these practices have also opened up spaces for the negotiations of local approaches to sharing, and to the articulation of local cultural property rights. However, where members of the Doig River community opted to keep sensitive heritage off the web, members of the Wat Pratupa community have defaulted towards more open sharing of heritage documentation, indicative of diverse approaches to safeguarding in the digital age.

In this paper, therefore, I look to a range of participatory media projects, including those I have described above, to argue that community-based productions of multimedia aimed at documenting, transmitting, and revitalizing intangible heritage are significant sites in which local cultural property discourses are articulated and put into practice. This is particularly important in the age of the 'born digital' ethnographic object, where heritage documentation can become subjected to unlimited circulation in the form of digital copies and remixes. National and local governments, heritage workers, anthropologists, curators—and, increasingly local stakeholders who represent their own cultures, languages, and histories—are some of the agents of transformation of intangible cultural expression into digital heritage. All play a role in determining what media documentation enters the public domain, and what remains privately managed at the local level. As Dorothy Noyes has argued, rather than reifying the concept of tradition as community managed heritage, folklorists, anthropologists, heritage workers, and policy makers should instead view local tradition as a vehicle for the "collective negotiation of

intracommunity conflict.”⁷ The projects I describe highlight processes of intra and inter-community negotiation of sensitive issues of ownership and cultural knowledge; while the digital is a common source of tension and anxiety, local responses and decisions vary across cultural, geographical, and historical contexts.

World heritage policies represent another dimension of the conversation. The UNESCO *Charter on the Preservation of Digital Heritage*, for example, states that “access to digital heritage materials, especially in the public domain, should be free of unreasonable restrictions. At the same time, sensitive and personal information should be protected from any form of intrusion.”⁸ But how, and when, is documentation of sensitive digital heritage differentiated from that suitable to be circulated in the public domain? In the name of safeguarding cultural heritage, how are decisions made about what should be made public, and which should be kept private? How can emerging anxieties and conflicts be productively channeled into the articulation of local cultural property rights discourse aimed at safeguarding? I argue that participatory media production projects aimed at documenting and transmitting cultural heritage create opportunities for this kind of decision making. The 2003 UNESCO *Convention for the Safeguarding of the Intangible Cultural Heritage*, with its emphasis on the role of local communities as full partners in efforts to safeguard their cultural heritage,⁹ must be considered in relation to the universal access oriented discourse around digital cultural heritage. In the age of the ‘born digital’ ethnographic object, the safeguarding of the intangible and the digital must be understood as interwoven projects.

2. The Intangible and the Digital

While documentation of intangible heritage is only one aspect of safeguarding, it represents an important moment in the transition from intangible expression to digital cultural heritage. The proliferation of digital tools available at low cost for the increasingly interconnected projects of documentary recording, archiving, and sharing has amplified the scale of digital production in heritage conservation initiatives¹⁰ and has implicated digital documentation in processes of making media public and removing control over the circulation of heritage from local contexts.

In the following section, I look to UNESCO’s definitions of *intangible cultural heritage*, *safeguarding*, and *digital heritage* to emphasize the role of participatory media production projects in creating space in which key decisions can be made about the ethical circulation of heritage documentation. How do these heritage policy definitions relate to a spectrum of on-the-ground practices of knowledge and information management in diverse global contexts? I begin to answer this question by describing a range of participatory digital media-based projects that offer insight into the potential of digital production to further local goals for ‘safeguarding’ cultural heritage in the digital age.

⁹ See Richard Kurin, “Safeguarding Intangible Cultural Heritage: Key Factors in Implementing the 2003 Convention,” *International Journal of Intangible Heritage* 2 (2007): 10-20.

¹⁰ A spectrum of projects, approaches, and critical responses to the use of new technologies in heritage conservation can be found in: *Theorizing Digital Heritage: A Critical Discourse*, ed. Fiona Cameron and Sarah Kenderdine (Cambridge and London: MIT Press, 2007); *New Heritage: New Media and Cultural Heritage*, ed. Yehuda E. Kalay et al. (London and New York: Routledge, 2008).

“Intangible cultural heritage” is defined in the 2003 Convention for the Safeguarding of the Intangible Cultural Heritage as:

...the practices, representations, expressions, knowledge, skills – as well as the instruments, objects, artifacts and cultural spaces associated therewith – that communities, groups and, in some cases, individuals recognize as part of their cultural heritage. This intangible cultural heritage, transmitted from generation to generation, is constantly recreated by communities and groups in response to their environment, their interaction with nature and their history, and provides them with a sense of identity and continuity, thus promoting respect for cultural diversity and human creativity.¹¹

The Convention also details a process through which intangible heritage may be protected for future generations. The notion of ‘safeguarding’ in the Convention is described as:

...measures aimed at ensuring the viability of intangible cultural heritage, including the identification, documentation, research, preservation, protection, promotion, enhancement, transmission, particularly through formal and non-formal education, as well as the revitalization of various aspects of such heritage.¹²

Article 15 of the Convention further emphasizes the role of cultural communities, groups and individuals in safeguarding initiatives, stating that:

Within the framework of its safeguarding activities of the intangible cultural heritage, each State Party shall endeavor to ensure the widest possible participation of communities, groups, and where appropriate, individuals that create, maintain, and transmit such heritage, and to involve them actively in its management.¹³

Safeguarding, by these definitions, should depend on participation at the local level, rather than top-down intervention and control of intangible heritage initiatives. As Richard Kurin has emphasized, this Article in the Convention represents a shift in perspective on the role of culture bearers in determining best practices for safeguarding. He writes:

Governments, or university departments or museums, cannot just assume that they have permission to define intangible cultural heritage and undertake its documentation, presentation, protection, or preservation. Community participation is meant to be significant and meaningful—involving the consent of community leaders, consultation with lead cultural practitioners, shared decision making on strategies and tactics of safeguarding and so on. Article 15 strongly empowers the community in the operation of and realization of the Convention.¹⁴

Local participation in safeguarding initiatives must therefore include more than decision making about what to include in inventories and lists of intangible heritage, or what to document; indeed, as Michael Brown points out, the discipline of anthropology “long ago concluded that documentation has only a

¹³ UNESCO, *Convention for the Safeguarding of the Intangible Heritage*, Article 15.

¹⁴ Richard Kurin, “Safeguarding Intangible Cultural Heritage: Key Factors in Implementing the 2003 Convention,” *International Journal of Intangible Heritage* 2 (2007), 15.

modest role in the preservation of culture. To think otherwise is to make the classic error of mistaking the map for the territory it represents.”¹⁵ Rather, participatory processes of safeguarding should involve the creation of opportunity for the careful consideration of the implications of digital documentation, and the development of local strategies for determining which documentation can safely enter the public domain.

These considerations are important as the “digital heritage” becomes a focus of international preservation efforts. Digital heritage is defined in the draft Charter on the Preservation of the Digital Heritage as consisting of:

...unique resources of human knowledge and expression. It embraces cultural, educational, scientific and administrative resources, as well as technical, legal, medical and other kinds of information created digitally, or converted into digital form from existing analogue resources. Where resources are “born digital”, there is no other format but the digital object.

Digital materials include texts, databases, still and moving images, audio, graphics, software and web pages, among a wide and growing range of formats. They are frequently ephemeral, and require purposeful production, maintenance and management to be retained.

Many of these resources have lasting value and significance, and therefore constitute a heritage that should be protected and preserved for current and future generations. This ever-growing heritage may exist in any language, in any part of the world, and in any area of human knowledge or expression.¹⁶

Like the definition of intangible cultural heritage, which seems to embody nearly every possible form of expression, so the digital heritage would seem to include nearly all of contemporary digital production. “Born digital” media—which represents an exponentially growing domain of digitally produced documentation of intangible cultural heritage—fits neatly into this definition. However, the Digital Heritage Charter also acknowledges the complexities of legal and ethical access to digital materials:

The purpose of preserving the digital heritage is to ensure that it remains accessible to the public. Accordingly, access to digital heritage materials, especially those in the public domain, should be free of unreasonable restrictions. At the same time, sensitive and personal information should be protected from any form of intrusion.

Member States may wish to cooperate with relevant organizations and institutions in encouraging a legal and practical environment which will maximize accessibility of the digital heritage. A fair balance between the legitimate rights of creators and other rights holders and the interests of the public to access digital heritage materials should be reaffirmed and promoted, in accordance with international norms and agreements.¹⁷

While the intricacies of implementing and policing access to digital heritage materials remain to be explored, I hold these definitions up against one another to emphasize the extent to which the intangible

¹⁶ UNESCO, *Charter on the Preservation of the Digital Heritage*, 2003, 1.

¹⁷ *Ibid.*, 2.

and the digital, and their related policy instruments and definitions, are connected through the act of documentation and circulation. The complexities of safeguarding intangible cultural heritage in the digital age are not adequately reflected in current policy documents, even though the need for stakeholder participation and attention to digital heritage access are acknowledged. Museum scholar Fiona Cameron laments the lack of critical discourse around digital heritage, even though the “ascription of heritage metaphors to cultural materials in a digital format means that digital media has become embedded in a cycle of heritage value and consumption, and in the broader heritage complex.”¹⁸ With emphases on ensuring maximum public access through programs like “Information for All” and “Memory of the World”, the UNESCO *Charter on the Preservation of the Digital Heritage*, for example, is seen to exemplify the induction of digital cultural heritage materials into broader dynamics of globalization and heterogenization.¹⁹ As Michael Brown points out, major heritage policy documents demonstrate a tension between cultural internationalists and cultural nationalists, an ongoing concern with “the balance between heritage as a resource for all of humanity and something that properly belongs to, and remains controlled by, its community of origin.”²⁰ Jane Anderson has further explored the ‘anxieties’ associated with access to and circulation of the contents of colonial archives; she describes a growing tension in which Indigenous communities are demanding recognition as legitimate authors and owners of documents representing their cultures, but are faced with the reality that legal ownership is granted to the individual who made the documentation (a photograph, an audio recording, a video recording, and so on). According to Anderson, these archival materials are anxiety inducing because they often do not reflect contemporary cultural identifications and desired representation, or their anticipated use and circulation.²¹ Participatory processes can represent moments of negotiation—even conflict—over what to circulate publicly and what to manage privately, determining how and if the products of intangible cultural heritage safeguarding initiatives should become a part of the world’s digital heritage. The resulting tensions and anxieties are exacerbated in discourse and practices related to the production of digital heritage, making local participation in documentation of the intangible and the digital increasingly relevant.

3. Participatory Media Production and Local Cultural Property Rights Discourse

As I will describe below, documentary practices and related negotiations, conflicts, and dynamics create opportunity for the discussion of ownership and ethical circulation of cultural property. The following case studies represent a spectrum of techno-mediated approaches to safeguarding heritage in the digital age, in which the articulation of local cultural property rights discourse plays a central role. I begin with a series of examples from the Pacific, North America, and Australia, and then move on to describe my own fieldwork in northern British Columbia and Thailand.

²⁰ Michael Brown, “Heritage Trouble: Recent Work on the Protection of Cultural Property,” *International Journal of Cultural Property* 12 (2005), 48.

²¹ Jane Anderson, “Anxieties of Authorship in the Colonial Archive,” in *Media Authorship*, ed. C. Chris and D. Gerstner (London: Routledge, forthcoming 2012).

As a first example, Guido Pigliasco's collaborative production of a cultural heritage DVD and archive with the Sawau Tribe of the island of Beqa, Fiji became a process of negotiation of intellectual property issues.²² *The Sawau Project* focuses on the reclamation of documentation of the *vilavilavevo*, the Sawau practice of firewalking. In past decades, the *vilavilavevo* has been widely circulated and commodified, but has now been claimed by the tribe as their own to control and perform.²³ The DVD project, which uses the geography of Beqa as its framework for navigation of content, is an archive of repatriated documentation of the *vilavilavevo* and video vignettes detailing the origins of the firewalking tradition. Engaging with this media and the meaning of this element of Sawau intangible heritage required the negotiation of anxieties associated with the sharing of digital media. The successful completion of the DVD project required the collective expression of a local cultural property rights discourse to make decisions about what could be shared, and what would be safeguarded offline. Ultimately, project participants made the decision to limit the circulation of their project, restricting it to locally shared DVDs instead of web-based access, thereby reducing participation in the ongoing appropriation of practices belonging to the Sawau people.

In another example, Jason Baird Jackson describes Woodland Indian digital documentary practices in the contexts of cultural performance and ritual.²⁴ He makes the observation that as new recording technologies have become available, Indian peoples in Oklahoma who are concerned with the conservation of ancestral forms of music, dance, and ritual have actively integrated digital documentation into their production of digital archives for educational and personal use. He notes that these practices have emerged along with anxiety and tension about the potential commoditization of documentation, and the loss of ceremonial leaders to control how recordings are used. Woodland digital documentary practices, which include the use of cell phones, video cameras and other ubiquitous technologies "...have unfolded within a local intellectual property (IP) system rooted more broadly in tribal regional cultures and social norms."²⁵ At the same time, Jackson argues that these same practices can be found to be in contravention of World Intellectual Property Organization (WIPO) treaties, therefore potentially subject to massive, bankrupting fines—demonstrating significant tensions between local practices and regimes of ownership, and global heritage policies that aim to protect these same practices. Safeguarding cultural heritage, in these contexts, is more complex than ascribing to specific international policies; as Jackson convincingly argues, both the Free Culture movement (as described by Lawrence Lessig, for example²⁶) and intellectual property solutions presented by WIPO and others place local communities in contradictory positions that have yet to find resolution.

Kimberly Christen's work with Warumungu people in Australia, and with Native American tribes in the United States, further shows how the collaborative design and implementation of digital heritage archives can create opportunities for the negotiation and articulation of local cultural property rights

discourse.²⁷ Her work on the development of the *Mukurtu*²⁸ open-source cultural heritage management system has generated insight into the wide spectrum of approaches to local heritage management that Indigenous peoples in particular are seeking to meet their contemporary needs for safeguarding their cultural property. Mukurtu gives local communities the opportunity to define culturally appropriate access to heritage documentation by customizing the Mukurtu database to meet their particular needs. In this way users are able to engage in decision making around the definition what should be made public, and what should remain private, or which media should remain somewhere in between, circulating within the “proper” systems of knowledge exchange and supporting off-line, everyday social and cultural interactions that involve the limited exchange of cultural knowledge. The Mukurtu archive, and the related Plateau Peoples’ Web Portal are both built on principles of “respectful repatriation” that aim to support such ethical circulation of cultural property.²⁹

3.1 From Canada to Thailand

These dynamics of media production and negotiation of representation of culture and language have also been reflected in my fieldwork in Canada and Thailand. For example, linguistic anthropologist Patrick Moore and I identified similar outcomes in our study of endangered language documentation among members of the Carcross-Tagish First Nation in the Yukon Territory in northern Canada.³⁰ Working in partnership with the First Peoples’ Cultural Foundation to document the Tagish language, and upload documentation to the language archiving website FirstVoices.com, we observed that project participants created an environment in which elders and youth were able to articulate an Indigenous language ideology in resistance to the values and historical practices of residential schools and a history of control of native language revitalization by outside organizations. In this environment, local control over language revitalization efforts was facilitated by a collaborative relationship with archiving and technical consultants at FirstVoices.com. Participants placed emphasis on the holistic nature of language and culture, showed preference for traditional modes of social interaction, and demonstrated the centrality of elders’ knowledge in the language revitalization process. The digitally mediated space created through partnership with the First Peoples’ Cultural Foundation also functioned to connect language revitalization efforts to broader Carcross-Tagish discourse around political authority, land claims, and cultural identity.

During my work with the Doig River First Nation between 2004 and 2008, I co-curated (with Amber Ridington) a collaboratively produced Virtual Museum of Canada exhibit of oral narratives and song called *Dane Wajich—Dane-zaa Stories and Songs: Dreamers and the Land*.³¹ The project drew on archival ethnographic documentation created in Dane-zaa communities by anthropologists Robin Ridington, Jillian Ridington, and Antonia Mills over the last forty years.³² It re-presented these media

alongside contemporary documentation of narrative and song that we had created in collaboration with members of the Doig River community in the course of the virtual exhibit production.

As I have described elsewhere,³³ *Dane Wajich* was developed using an open, participatory production process that was guided by elders and community leaders. It involved Doig River First Nation youth in central roles as media documentarians and organizers. Project planning meetings were recorded, some of which became central elements of the virtual exhibit for the way they demonstrated a Dane-zaa methodology for intangible heritage documentation. One such meeting took place in July of 2005 in the Doig River gymnasium. Elder Tommy Attachie spoke to a group of community members and project participants assembled to plan the project. His focus was a painted moose hide drum skin that had been made by a Dane-zaa prophet named *Gaayeq* one hundred years before; the drum had been brought to a meeting by its caretaker, former Chief Garry Oker, who played a central role in project planning. Tommy Attachie used the drum, which featured a map of heaven dreamed and painted by *Gaayeq*, to connect the history of Dane-zaa prophets to material culture, oral narrative, and land. He also used his knowledge of the drum—its history, and its significance in the present—to define a methodology for documenting Dane-zaa intangible cultural heritage. In the weeks that followed the performance of this narrative, our group traveled to seven sites in Dane-zaa territory where elders, youth, ethnographers and linguists recorded videos documenting life histories, traditional narratives, and histories of Dane-zaa dreamers. Between 2005 and 2007, our project team then worked to develop and complete the virtual exhibit, consulting with Chief and Council, elders, and community members from the storyboarding pre-production process through to official exhibit launch.

In the course of these consultations and design sessions, however, important questions were raised about the ownership and control of archival recordings of Dane-zaa dreamers, as well as the appropriateness of showing images of dreamers drawings, like the one featured on *Gaayeq*'s drum, to the public over the Internet. Objections were raised in a neighboring Dane-zaa community by descendants of another prominent dreamer, Charlie Yahey, about the use of the image of their ancestor in Doig River's media project. Ultimately, the Doig River Chief and Council had to make a decision, taking into account varying positions held by members of the community, about how to proceed. The decision was made to remove all images of dreamers drums from the virtual exhibit, in order to respect traditional care and handling of dreamers drums, which had included keeping them out of public view, except in special circumstances. The decision was also made to respect the intellectual property rights being claimed by the descendants of Charlie Yahey, which meant no longer using media that documented him in the exhibit. At Doig River, meaningful local participation in digital documentation of intangible cultural heritage, and the subsequent presentation of oral narratives, photographs, and other media, opened up space for negotiation and debate over ownership and control of Dane-zaa cultural heritage and its circulation in digital form.

I observed similar dynamics in my fieldwork in Thailand. Between 2009 and 2011, I worked as a lecturer and resource person in the Intangible Cultural Heritage and Museums Field School in Lamphun, northern Thailand, organized by the Sirindhorn Anthropology Center and UNESCO, Bangkok. The goal

of the fieldschool is to introduce students from the Mekong Delta region to a wide range of practical issues, debates, case studies, and critiques of the 2003 ICH Convention. Over the last two field school seasons, I collaborated with students and the temple community of Wat Pratupa, one of the field school research sites, to document and represent locally-identified endangered elements of intangible heritage. At Wat Pratupa, local heritage documentation activities and digital circulation of representations of intangible heritage over the Internet have created opportunities for the negotiation and articulation of local cultural property rights discourse.

Wat Pratupa's Assistant Abbott, Phra Patiphan Puriphanyo, is the creator and Webmaster of a site called www.muanglamphun.com, on which, at that time, he regularly posted local documentation and news related to temple activities and documentation of local traditions, festivals, and practices. The website, and its related Facebook page, were being used as a strategy for circulating the distinct practices of Wat Pratupa's ethnic Yong community. In 2010 and 2011, I worked with students to explore some of these practices; first, we looked at issues related to the safeguarding of ethnic Yong poetic narratives called *Kap Kalong*, which reiterate the history of ethnic Yong migration from Burma, and details contributions of families and individuals to the Buddhist merit-making festival, the *Salak Yom*; the following year, we collaborated with the Assistant Abbott and community members to produce a short documentary video about local efforts to revitalize and protect the endangered Yong language.³⁴ This video and other field school documentation were circulated on www.muanglamphun.com and the related Facebook page.

Wat Pratupa's current approach to sharing documentation of their intangible heritage, I learned, was largely shaped in the process of developing the temple website. The site and Facebook page first featured extensive photographic documentation of the *Salak Yom* festival, historical photographs that the Assistant Abbott had collected from members of the community, and representations of other local traditions that had been identified as in need of protecting and publicizing. However, it was the decision to document and share images of sacred material culture owned by Wat Pratupa—specifically, the contents of a Buddhist palm-leaf manuscript and a rare wooden Buddha carving—that stimulated local discussion about the benefits and risks of digital documentation in the service of safeguarding heritage. After images of the Buddha and manuscript were posted on the website, villagers were surprised by the outside interest they generated, including the arrival of non-local filmmakers seeking to make a documentary about the valuable collection. With new awareness of the digital visibility of the collection, members of the community began to worry about the physical safety of the objects. Yet these events, and the anxieties that they produced, resulted in local decision making about appropriate digital circulation of heritage documentation. Eventually, the Assistant Abbott told me, it was decided that it was advantageous to share images of significant sacred objects in the Wat Pratupa collection, because the original objects could be kept safe and out of public view, protected from thievery. He told me:

There's an idiom saying, 'If you swallow, it disappears; if you spit it out, it remains'. No matter how wise you are, if you don't have a disciple, your wisdom goes to waste. But if you teach your disciples, your knowledge transcends your own life. It doesn't matter if replicas were created, because a genuine is still a genuine. In fact, there are even more watchers than before because there are more people who are aware of these significances.

³⁴ Sirindhorn Anthropology Centre, "Because We Are Yong," Video, 2011 (7 mins 12 sec). Produced by Tashi Dendup, Kate Hennessy, Nalina Gopal, Aynur Kadir, Inpone Thephetlasy, and Aree Tirasatayapitak, and Apinan Thammasena. Accessed Aug 20, 2012, at <http://www.youtube.com/watch?v=jGwgLiJ1bYE&feature=plcp>

A sense of ownership keeps growing, which may lead to two different strategies: increased security measures, or increased studies and revitalization. The decision depends on the conservators and the community... Let the knowledge spread in the community.³⁵

4. Conclusion

In this paper, I have presented examples from the field that locate the production and circulation of digital heritage as central in debates over local cultural property rights. Participatory media production processes, where the transformation of intangible cultural heritage into digital heritage takes place, represent important moments in which community-based negotiation of the control of documentation and cultural representation can take place. These negotiations, as I have described, can include the definition of appropriate methodologies for intangible heritage documentation and the digital circulation of representations of local material culture, archival media, and intangible expressions. These locally defined processes of cultural heritage documentation and their negotiations facilitate the development of local approaches to controlling cultural property, which will range from restrictive to more liberal, depending on content and context. These processes and negotiations are particularly important in relation to world heritage policies, leading to the question: how can international policy instruments better acknowledge and support the range of on-the-ground approaches to cultural property and safeguarding? The Intangible Cultural Heritage Convention and the Digital Heritage Charter should be considered and implemented with awareness of the complexities and diversity of local cultural property rights discourse. State parties, heritage workers, and community members should be encouraged to take necessary steps to ensure that meaningful participation in intangible and digital heritage safeguarding initiatives includes space for the negotiation of diverse approaches to ownership and circulation of cultural heritage.

Acknowledgements

Sincere thanks to members of the Doig River First Nation, to *Dane Wajich* exhibit co-curator Amber Ridington, and to Patrick Moore, Robin Ridington, and Jillian Ridington. Thank you to Wat Pratupa Assistant Abbott Phra Patiphan Puriphanyo. Preservation Infrastructures: Current Models and Potential Alternatives

An Example to Follow

An Infrastructure for Interoperability and Governance in the Tuscan Public System for Digital Preservation

Ilaria Pescini and Walter Volpi

Regione Toscana, Italy

Abstract

For years, Tuscany has promoted several projects of digitization of administrative procedures. These projects are based on a technological and organizational pre-existing substrate: a territorial system that involves government agencies of that region and private. Entire community uses that same technological infrastructures that are shared across regional territory and which allows the creation of cooperative services using normalized and standardized rules and languages. On this basis the project DAX (Digital Archives EXtendend) was started. This project has led to the creation of an infrastructure for long-term preservation for digital archives. It serves all the regional administration of Tuscan territory. DAX is an accountable system to describe and manage non-current and historical archives, and to storage singles records. DAX is an example of cooperation and interoperability policies pursued for years in Tuscany, in the field of innovation.

Authors

For the past ten years Ilaria Pescini has been an employee of the Regional Government of Tuscany, where she has the responsibility for archives and document management system. She had already a long experience with traditional historical archives. She has been increasingly involved in digitization, a process triggered by national laws issued since 2000. She is now focusing on projects that relate to record management, digital document management (authenticity, electronic signature, interoperability, workflow management), digital certificates, and citizen-oriented services for the free but secure circulation of documents. She has collaborated closely with the ICT division of the regional government. She is member of regional and national working group about archival standard and archival legislation.

Walter Volpi has a degree in Computer Science from the University of Pisa; for the past ten years he has been an employee of the Regional Government of Tuscany, where he is responsible of interoperability and applicative cooperation unit. He is a supervisor of IT architecture, focused on event driven architecture (EDA) and service oriented architecture (SOA) and a Service Level manager for the territorial infrastructure of interoperability and applicative cooperation. He leads regional and national working groups with representatives of the main ICT vendors, universities, central and local administrations, in order to define rules and models for interoperability standards both technical and semantical. He is Project Manager that relate to digital document management, digital preservation and Open data.

1. Introduction

This report provides an overview about the system for long-term preservation of digital archives¹ by the Region of Tuscany. The system will storage the archives by all different government agencies within the region. This is one of the first experiences in this branch in Italy and it is a meaningful experience for at least four reasons, generally speaking and not specific about digital preservation.

¹ In this report we intend to speak about archive like a whole of the records organically created and accumulated by a public corporate body in the course of that creator's administrative activities.

The first reason concerns organization and descends from the choice of creating a territorial system involving all the various government agencies of the region, under the coordination of the main administration. The second reason is based on political choices that encourage the development of public governments network sharing many technological innovation projects. The third reason, of technical nature, provides a valuable contribution to the entire system: the technological infrastructures the system uses, work for the entire community. These infrastructures implement the interoperability and interchange channels for many other services.

Furthermore, as fourth reason, it obeys the Italian legislation on digitization² and, at the same time, interprets the State law which delegates each public administration to maintain their own archives, introducing a new perspective where a single regional archive assembles them.

2. The Context

It is important to underline that the long-term preservation system, a project created, commissioned and planned by Region of Tuscany and called DAX (Digital Archives eXtended), was conceived in an advanced administrative, archival and technological context.

Regione Toscana is a territorial administration created in 1970, like all the other regions located all over the Italian national territory, and it is one of the five kind of institutions constituting Italian Republic. The task of each Region is the government and the growth of its territory; this is possible thanks to its strong legislative power and to an administrative and planning organization, which are both exercised in complete independence from the central power, but with a strong link with local authorities. In comparison with other Italian Regions, Tuscany made a stronger use of tight cooperation with local institutions³ to exercise its governance through agreements on many different topics. Regione Toscana has been the main driving entity for its territory concerning the themes of innovation mainly through the Information and Communication Technology (ICT) project. For this reason, Regione Toscana is a national model and a reference point regarding e-government.⁴

Since 2004 Regione Toscana, through a regional law,⁵ has established a community network that gather up all the public institutions forming the regional territory, i.e., local administrations, Tuscan universities and public bodies dealing with public healthcare. Following this law the Community Network

² The term dematerialization indicates the gradual increase in the computerized document management - within public and private administrative structures - and the consequent replacement of traditional media in favor of electronic documents. Dematerialization is one of the central topic of the Italian legislation on reform and innovation in public administration (see Codice Amministrazione Digitale – Dlgs March 7, 2005, n. 82). Since 1997 the Italian national legislation recognizes full legal value to electronic documents.

³ In the Italian legal system a local authority (ente locale) is a public body whose jurisdiction is limited within a specific territorial area. The local authorities are opposed national bodies whose competence extends over the entire national territory. In Italy, the term has a specific meaning referring to local authorities such as municipalities, provinces and metropolitan cities, under the Italian Constitution.

⁴ E-Government (short for electronic government) is digital interactions between Governments or Agencies, and between government and the Citizens or businesses. It is defined as “The employment of the Internet and the world-wide-web for delivering government information and services to the Citizens.” (United Nations Department of Economic and Social Affairs, “United Nations E-Government Survey 2012”).

⁵ Regional Law of Tuscany Region 26 January 2004, No. 1, “The promotion of electronic administration and of the information and knowledge society throughout the regional system. Rules for the “Tuscany Region Data Communication Network.”

has its own managing structure, and promotes cooperation among different administrative entities, according to his own skills and necessities. Operational tools and functioning bodies of this network involve politicians and technicians of all the administrations: a Strategic Committee, which plans and coordinates the program and subjects, drives the choices implemented by a Technical Direction through the promotion and the realization of projects and services for every joining member; at last a general Assembly gathers all the administrations and, once a year, introduces and evaluates the results. The Network gives legal identification to systems of administrative interoperability, of instruments and contents sharing, of data and information and of administrative processes.

The kind of relations created among public institutions and different subjects⁶ form a complex system, managed through ICT systems and architectures.

The computerization process started to yield significant results thanks to the new transversality and interoperability of technologies, which give concreteness to the interoperability and transversality of administrative effort, to which we are referring.

Italian national rules, concerning public administrations technologies, have been promoting and stimulating the use of interoperable systems and infrastructures for years; the aim of these technological infrastructures is the integration of procedures used by different subjects of the same territory (both national or regional). Through these technological infrastructures is possible to achieve data and information interchange and interaction among different entities allowing them to cooperate.⁷ In Tuscany this is supported by a unique technological infrastructure that carries out applicative cooperation assuring an extremely advanced interoperability.⁸

Every dematerialized administrative process becomes part of a meta-system that allows the sharing of tools and information, coming from different administration systems included in the same Community. This technological choice comes from an organizational and archival need, because information, documents and administrative processes have a transversal role among more entities that are often part of the process, at the same responsibility level.

Tuscan system perfectly responds to the recommendations of European Interoperability Framework for Pa European e-Government Services (EIF)⁹ which identifies different levels of interoperability and emphasizes the importance of cooperation among organizations and processes coordination.

⁶ Since the administrative reforms of the late nineties has been introduced, in the functioning of the Italian public administration system, a kind of institutional relations network, which reconciles the need for autonomy and accountability with the need for integration based essentially on the system of local government and in accordance with the principle of subsidiarity. The Italian public administration today is seen as a unique network of subjects that intersect powers and functions, subjects who are no longer part of a hierarchy but are coordinated in a network system in which each element is a sibling node.

⁷ <http://www.progettoicar.it/Home.aspx>

⁸ <http://www.cart.rete.toscana.it>

⁹ For European Interoperability Framework the dimension of interoperability are: *Political Context* - Cooperating partners having compatible visions, and focusing on the same things; *Legal Interoperability* - The appropriate synchronization of the legislation in the cooperating MS so that electronic data originating in any given MS is accorded to proper legal weight and recognition wherever it needs to be used in other MS; *Organisational Interoperability* - The processes by which different organisations such as different public administrations collaborate to achieve their mutually beneficial, mutually agreed eGovernment service-related goals; *Semantic Interoperability* - Ensuring that the precise meaning of exchanged information (concept, organisation, services, etc.) is preserved and well understood; *Technical Interoperability* - The technical issues involved in linking computer systems and services (open interfaces, interconnection services, data integration, middleware, data presentation and exchange, accessibility and security services, ...). Cfr. <http://ec.europa.eu/idabc/en/chapter/5883.html>.

On archival and normative side, Region of Tuscany declared, with regional law of 2009, to “take necessary measures for the de-materialisation of administrative documents, encouraging their storage in digital format with methods which enable preservation and use over time.”¹⁰ Moreover Regione Toscana “provides for and maintains a technological platform and digital services for the preservation of computer documents which enables joint management of the documents in both hard copy and digital format...”¹¹ With the same law, and consistently with what established by the territorial governance, the Region “promotes the establishment of the regional administration and regional agencies archive network in order to favour the sharing of tools and information in a coordinated manner, as well as access to the archive documentation and the development of documentary assets” and the improvement of documental heritage.¹²

Through DAX Region of Tuscany has materialized regional law 2009, n. 54.

3. Motivations and Goals

Within this organizational and technological context, the regional Community Network has delegated the Region of Tuscany to build a platform for the preservation of administrative records¹³ produced in digital form by Tuscan public administrations. So, DAX arose in response to the needs of a variety of subjects, even if the major administration—the Region—has played a larger role in coordinating the activities: it has the responsibilities in the design and implementation of the system. In particular the Region takes care of the dissemination of the culture of these issues. It should not be forgotten that such a complex system would be difficult to achieve for small administrations as Italian municipalities are. A coordinated project helps the cheapness and a considerable saving in terms of human resources and management.

It seemed also important for the growth of the area and its public administration, in this moment of transition from traditional to digital documents, to develop the culture of these issues and also provide support to smaller organizations, creating a common cultural fabric and shared rules. In addition to the uniformity of treatment of digital archives, a single storage system would have reached a higher level of performance in the efficiency of public administration and most of all, the easier relations with citizens, and with all users interfacing with a unique system.¹⁴

¹⁰ Regional Law of Tuscany Region, 5 October 2009, n. 54, “Establishment of the regional information and statistical systems. Measures for the coordination of infrastructures and services for the development of the information and knowledge society,” art. 10 (“Documentary activities”), comma 2.

¹¹ Regional Law of Tuscany Region, 5 October 2009, n. 54, ..., art. 10 (“Documentary activities”), comma 3.

¹² Regional Law of Tuscany Region, 5 October 2009, n. 54, ..., art. 14 (“Regional Archives”).

¹³ With the expression “administrative document” we intend to indicate any graphic, fotocinematografic, electromagnetic or any other species of the content of documents, including internal or not related to a specific process documents. They are held by a public authority and related public interest activities.

¹⁴ “Access right” means, in accordance with current Italian legislation, the right of interested parties to consult and take copies of administrative documents. All citizens, companies and associations, including those of public or common carriers, can exercise access right (see http://www.governo.it/Presidenza/DICA/4_ACCESSO/). The access right to administrative documents is a right granted to citizens on the basis of relations with the state and public administration, in order to ensure transparency of the governments. In Italy the access right is enshrined in Italian law, 7 August 1990, n. 241 “New Rules Regarding Administrative Procedure and the Right of Access to Administrative Documents.”

We cannot forget that archive has an important role in identity and memory of the activities of its producer, and that the necessity to preserve documents has to be respected, according to traditional archivistic science rules and Italian archival laws.

For these reasons a system able to preserve already formed, arranged and structured archives, the noncurrent and historical ones, was conceived. They consist of records, no longer useful for their producer. DAX does not deal with current records and archives whose creation and management are delegated to the specialized systems. The current archives will be sent to DAX as they become non-current. Therefore, the task of this platform should be to maintain archives, in compliance with national and international standards, and in compliance with national and European archival law.

4. Technological Foundations

The Tuscan platform for the long-term preservation, as we mentioned, was devised using pre-existing organizational and technological infrastructures. Among those the telematic network, called RTRT (Rete Telematica Regionale Toscana - Tuscan Regional Telematics Network), plays a key role. It is a network with large capacity, spread throughout the region, connected to the Internet, and compliant to the national standards. The other fundamental infrastructure is the technological infrastructure for interoperability called CART (Cooperazione Applicativa Regionale Toscana - Tuscan Regional Applicative Cooperation). These enabling infrastructures comply with the Italian national legislation in terms of Public Administration standards. They have been certified and accredited at the national level, provide higher quality services than the standard market ones, realizing a multi-supplier model. Particularly for the entire Community they provide and ensure:

1. A set of connectivity services shared by the Tuscan public administrations;
2. Interaction with all the other subjects of Italian government connected to the Internet, as well as the networks of other institutions; they promote the delivery of quality services for citizens and private companies;
3. Shared exchange infrastructure that enables interoperability of information systems with external agencies;
4. The development of interoperable systems, according to the model of applicative cooperation, safeguarding data security, confidentiality of information, respecting the autonomy of the information assets of each administration and the current rules about privacy.

A particular relevance, in the context of the just mentioned infrastructures, is the implementation of interoperability¹⁵ among the different network actors. In Tuscany, we said, it is performed through a framework called CART. CART achieves the interoperability of applications of different organizations that decide to work together to get common supplying of public services. CART uses a set of software tools and defines a set of shared elements: management services, vocabulary, concepts, principles, policies, guidelines, recommendations and practices. These common elements become part of documents

¹⁵ “Interoperability within the context of European Public Services delivery, is the ability of disparate and diverse organizations to interact towards mutually beneficial and agreed common goals, involving the sharing of information and knowledge between the organizations, through the business process they support, by means of exchange of data between the respective ICT systems:” http://ec.europa.eu/isa/documents/isa_annex_ii_eif_en.pdf.

arranging standards of interoperability among systems, and these documents are named “RFC e.Toscana”. Those standards are proposed by the technicians of the various domains and are open to public discussion. The negotiating process to produce interoperability standards involves public government, universities, research centers and private companies. These entities define the set of rules and specifications to ensure the interoperability of systems for a specific application domain. The standards take into account previous national and regional decisions or choices, as well as national and regional experiences. In particular, the Community recommends interoperability agreements, collaborates on the definition of services interfaces and on the process of accreditation of software systems and standards-compliant solutions (e.Toscana Compliance). The e.Toscana Compliance Committee, consisting of universities, research centers in Tuscany and local authorities representatives, ensures the governance of the process, by supporting the dissemination of approved standards, accrediting conformity of the software products with the standards and provides support to entities of the territory.

All this corresponds to the recommendations on EIF (European Interoperability Framework for the Pan-European e-Government Services)¹⁶ contained in the attachment “Towards interoperability for European public services” by the Social Committee and the Committee of Regions of European Commission. This last one suggests the creation and deployment of infrastructure to support interoperability. It also emphasizes the role of open standards and interfaces for the implementation of interoperability systems between applications and business processes related to e-government public services.

The sharing of interoperability standards for services means that the different administrations of the region operate in the same way approaching entities outside territory. On one side, this approach allows Regione Toscana to achieve full interoperability and governance issues; on the other side provides value for citizens and agencies, which perceive the Tuscan government as a single entity, rendering their access to services easier. These methods contributed to the growth of an eco-system of public services and created a culture of interoperability. The services can be submitted and proposed by any administration, and they are experienced as an opportunity by other members in the Community, to improve their services. The entire Community participates in the creation of a real eco-system; it benefits of coming out of new services, or, in case, of improvements or integration of services already existing. The emergence of new services is assisted by a process aiming at the full sharing of interoperability specifications.

5. Architectural Components

DAX is deployed in the regional territory through information architecture fully distributed coherently with the structuring of the regional network infrastructures. The central components of the platform are deployed at the regional data center called TIX (Tuscany Internet eXchange)¹⁷, which provides services to all administrations which are part of the regional Community Network.

Among the services that TIX data center provides, DAX uses:

- *Storage*, or rather the ability to extend incrementally the size of data storage and their backups. The chance of expanding the system is a key feature because of the impossibility to determine, a

¹⁶ See footnote number 3.

¹⁷ You can find news about all infrastructures on the site <http://www.e.toscana.it> where there are also links to sites specifically devoted to individual technical infrastructure.

priori, the maximum capacity of storage required. Another significant quality of DAX is its ability to store separately the archives of several administrations of Tuscany. This ensures that the different administrations retain their responsibilities on archives and their descriptions;

- *Disaster recovery*, which is the guarantee of saving information on different sites and the subsequent recovery from an unforeseen incident at a Data Center. This quality is essential in a system such as DAX aiming to preserve documents and information;
- *Operational or business continuity*, namely to ensure that DAX is able to operate even in the case of adverse events. This quality is desirable for a conservation system: access to information becomes strategic with serious emergencies.

The central components of the storage system at the TIX, receive packages of documents from the administrations of the territory. These send groups of documents from their applications by using the CART infrastructure that gathers, validate and submit them. The process of collecting, validating and transmission of packages takes place through standard device components of DAX. Those components, called Proxy-DAX and deployed on CART infrastructure, interact directly with the local applications of entities. The choice to implement specific Proxy guarantees:

- The distribution of the platform workload;
- The selected forwarding packages that are effectively to keep stored;
- Minimization of the use of network bandwidth between local applications and central components of the DAX;
- An effective security policy for communication between applications and DAX;
- The possibility of storing data and information in the proximity of each entity; this guarantees excellent response times in document and information retrieval;
- A significant improvement in quality of fault-tolerance of the system.

Another important task of the Proxy-DAX is to break large packages into smaller ones that will be reassembled by the central components of DAX. This option allows local applications to send virtually unlimited size packages.

The application interfaces made available, to the local software applications, by the Proxy-DAX are defined in appropriate RFCs e.Toscana.¹⁸ In line with the process e.Toscana Compliance, the RFCs e.Toscana concerning DAX were discussed inside the technical community, with the participation of many local and national companies, and finally they were approved by the e.Toscana Compliance Committee and have become regional standards. The four RFCs e.Toscana standard, about DAX, are technical documents that companies should consult to implement software and adapt their applications to the use of DAX.

¹⁸ The RFC e.Toscana , describing the application interfaces realized by Proxy DAX, are: n° 188 (<http://web.rete.toscana.it/eCompliance/portale/mostraRFC?idRev=682&idRfc=188>); n° 206 (<http://web.rete.toscana.it/eCompliance/portale/mostraRFC?idRev=681&idRfc=206>); n° 176 (<http://web.rete.toscana.it/eCompliance/portale/mostraRFC?idRev=642&idRfc=176>); n° 189 (<http://web.rete.toscana.it/eCompliance/portale/mostraRFC?idRev=629&idRfc=189>).

In addition to the access control decision by the document management service providers, DAX supplies and facilitates consultation to records and content information by the side of users in response to a request. The access has to take place using the application safely through an identification Smart Card.¹⁹ These cards are distributed to all citizens of the region: they are associated with a user profile and about that profile DAX combines its application roles. In practice this means that each person may have access to some features rather than others or have visibility of a portion of the archive and not others.

6. Archival Fundamentals and Standards

From the archival perspective DAX applies the principles of archival science and the rules of traditional archives arrangement and description, transferring them to digital archives. The basic principle from which the analysis took the place is that the archive of an administration is an *unicum* and all documents, produced in the history of that administration, are part of this unitary system. The platform describes and manages digital documentation but it describes also traditional paper records (or more generally analogue objects). We thought this was a good way to ensure the uniqueness of the archive according to its provenance. At the same time, we kept in mind that preservation and description of digital records and archives require to highlight the peculiarities and keen differences between the two worlds.

In the first place DAX provides a solution to two problems that, although closely related, are not completely comparable:

1. The long-term preservation of digital records;
2. Archive management—depository and historical level—both analogue and digital.

The choice to manage, through this system, the hybrid archive, and not only digital, follows from the fact that the archives and single practices of our administrations are still largely produced on paper.

The platform DAX is based on the ISO OAIS (Open Archival Information System),²⁰ and in compliance with OAIS standard focuses on the preservation of information packages. In addition it describes the documental and archival context of creation, conservation and preservation, and identifies an application area. The decision to build a system OAIS compliant depends on we are in agreement with principles and topics of the standard, and we have considered the standard next to our reality: a community of well-defined baseline, share knowledge, standardization well tested tools, languages and methods. In fact it provides theoretical and interpretive trends not only for archives and its forming objects, but also for their context, and it suggests organizational answers.

With regard to relations with the environment, three types of entities or systems interface DAX: “producer” that creates and sends to the system the records and archives to be preserved, “user” who consults the archives by distance, in space and time; “manager” who, structured into several kinds with different responsibilities, takes charge of the management, maintenance and updating of the system as a whole. And finally, the objects to be preserved.

In this initial phase of the system’s use we decided to begin maintaining two broad categories of objects: general administrative records and health records. According to the several stages that OAIS

¹⁹ It is a hardware device, similar to a credit card, which contains all the information related to the digital certificates of the subject and which allow a certain authentication.

²⁰ Open Archival Information System is the name of the standard ISO: 14721:2003 which defines concepts, models and functions related to digital and aspects of digital preservation.

contemplates, records are processed and aggregated in packages, logical containers of records and information about records and their preservation. The packages distinguish themselves depending on the stage and type of entities (respectively called SIP and AIP)²¹ (Figure 1).

The system stores records in several digital formats that are made known to the community through a “list of allowed electronic formats” that can be expanded over time as needed. DAX also intends to keep any type of documents and files: text, database, image, e-mail or e-mail archive, map etc.²²

DAX has all the features of feeding, managing and finding of intermediate and historical archives, as regards both paper and digital objects, and it manages:

- *Ingest process* from the creation to preservation phase by receiving packages of documents and their metadata, from document production systems. The metadata sets forming the packages for the ingest process and keeping, are compliant with the national Italian standard UNI-SInCRO.²³ The ingest process occurs through the acquisition of “packages” (SIP-OAIS) consisting of a number of archival aggregates²⁴ and / or single record.²⁵ As DAX manages the intermediate and historical archives, these packages must contain no-active archival units and closed files or, at most, single non current record;
- *Logical organization and description* of the archives, in compliance with international standards for archival description.²⁶ The policy of the system is that the records description, required at the moment of ingest, is a dynamic description, enriching during the phase of preservation and at the request of access. The metadata sets, to describe and holding archives, were enhanced and compared with the sets worked out numerous international research projects, we held out as a model.²⁷ One of the great efforts of this project was, indeed, to try interpreting standards and best practices, with the aim to exploit the rich outcomes of many international projects;

²¹ We are speaking about the packages provided by the OAIS. There are three different types of information package: SIP (Submission Information Package) that is made at the time of ingest to the archive by the creator, the AIP (Archival Information Package), for storage in the DAX, the DIP (Dissemination Information Package), which is composed with the data relating to the distribution and access.

²² It was decided, in the phase of the activation of DAX, to start the system on certain types of archives and then specific formats, but through small changes and stepwise refinement, based on the needs of the government, will expand the range of sizes and the types of storable.

²³ This is the Italian national standard UNI 11386: UNI 11386:2010 - interoperability support in the Storage and Retrieval of Digital Objects (sync). It is the result of the National Italian unification (UNI), which was established within Subcommittee DIAM/SC11 (Management of archival documents), in 2009; it was a special working group, called Synchron.

²⁴ This archival unit is a consistent set of documents, grouped by a person for the purposes of its business, according to the common reference to the same subject.

²⁵ See footnote number 9.

²⁶ We are speaking about ISAD (G) (General International Standard Archival Description) and ISAAR (CPF) (International Standard Archival Authority Record For Corporate Bodies, Persons and Families) are standard adopted by the International Council on Archives, in order to define unique tools for the description of archives, for the registration of documents produced by organizations, individuals and families (www.icacds.org.uk/eng/). The first edition was published in 1994. These set of metadata are returned to the user organized according to the model EAD (Encoded Archival Description) and EAC (Encoded Archival Context of). Developed and published (1998) by the Society of American Archivists in partnership with the Library of Congress for encoding tools appropriate archival.

²⁷ Among these especially InterPARES - The International Research on Permanent Authentic Records in Electronic Systems (<http://www.interpares.org/>), PREMIS - Preservation Metadata Implementation Strategies

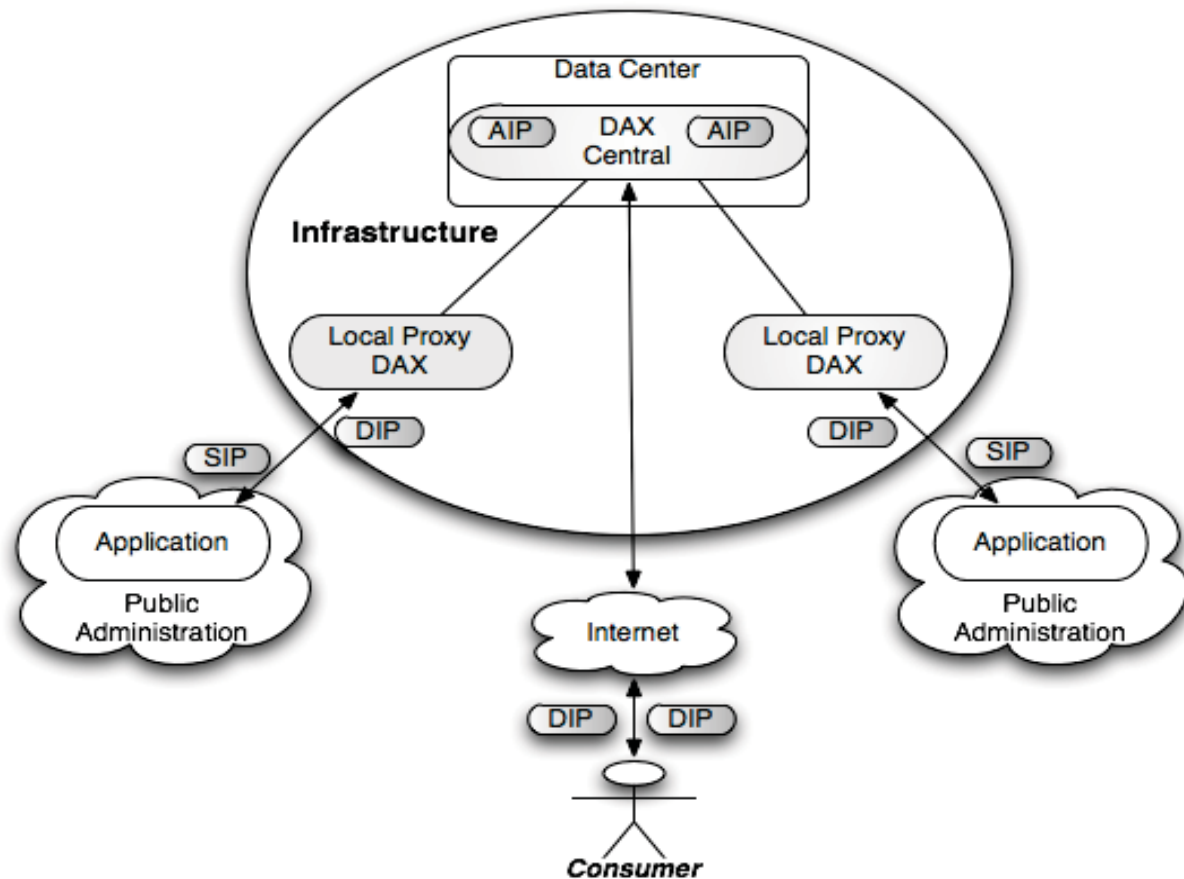

Figure 1. DAX architecture overview.

- *Appraisal and selection* and subsequent retention of predestined records; this phase includes implicit request for authorization by the Ministry of Cultural Heritage, in accordance with Italian law;
- *Access and rendering* of records and aggregated records and files by internal and external users of the system;
- *Access and consultation* by the Auditor (e.g., State offices: Ministry of Cultural Heritage – Soprintendenza Archivistica, Ministry of Innovation etc.) or justice organization;
- Clear definition of roles and responsibilities.

From the point of view of technological capabilities, the platform preserves digital documentation and, in order to cope with obsolescence of technology and software, enforces a continuous activity of control and migration.

(<http://www.oclc.org/research/activities/premis-rlg.html>), METS - Metadata Encoding and Tradition Standard (<http://www.loc.gov/standards/mets/>).

Furthermore DAX has another very important feature: it produces a complex auditing system that keeps the memory of all the logs occurred, both automatic and manual. This is an excellent method to control the functioning, processes and reliability of system, to preserve memory of operations and to assure safety of the archive. Based on this auditing system, as well as a continuous check on the data, it will be possible to make an assessment of the procedures put in place for storage. The audit data, obtained and organized by all the features of the platform, allow to measure the compliance of processes and procedures with respect to the characteristics of the system and their application, with reference to what has been defined in the analysis as a guarantee of reliability of the system and what is required by the certification systems.

7. The Architectural Features of DAX

An initial choice has set that the system was articulated into two connected but independent subsystems, playing different but complementary roles, since the system is logically unique. On the one hand, we have the part which governs the real archive, that focuses on the organizational and use aspects, carried out in accordance with the OAIS reference model. On the other hand, a complex storage that focuses on aspects of the Italian law topic called “conservazione sostitutiva”.²⁸ This kind of preservation is a legal and technological procedure that is regulated by the Italian law, to ensure, over time, the legal validity of an electronic document. According to the current laws, the digital document is “locked / closed” in form and content through the digital signature and time stamp, which, by setting the exact date and time of its crystallization, anchor it temporally and guarantee the fixity of information.

Thanks to this division into two subsystems, platform DAX is able to satisfy two requirements that initially seemed difficult to conjugate:

- Preserve digital objects “freezing” by hashing techniques and asymmetric key cryptography, according to the Italian law (bit-preservation);
- Preserve packages formed with records and metadata, assuring they can be changed over time (package-preservation), according to the OAIS reference model.

The system, as a whole, is responsible for ensuring that, in medium and long-term, records retain: integrity and authenticity, accessibility—as long as needed—and availability, legibility and intelligibility, and reproducibility.

Each of the two subsystems has some peculiarities but in general, given those guarantees, DAX takes charge of:

- Implement, manage, historicize tools and data about the organizational, archival, procedural and technological context. These contextualization is functional to the description of the stored documentary heritage: organizational structure of producer, classification plans and indexes, content types, appraisal plans, vocabularies to interpret specific metadata, encodings or terms, associated with documents;

²⁸ It is a set of rules laid down by a decision of the Authority for Informatics in Public Administration (AIPA) of 2004, n. 11. This rule is in the process of substantial change and the changes can be found at <http://www.digitpa.gov.it/gestione-documentale>.

- Provide services and references to search and browse the preserved documentation;
- Prevent the obsolescence of hardware and software through continuous adjustments and through processes of migration of digital stored documents;²⁹
- Record and store—in a unique audit system that returns summary data queried at multiple levels of detail—the tracking of each access, change and activity on the system (access, technological changes, and updates the metadata of digital documents);
- Keep alive the digital signature, in compliance with the Italian law (by the application and renewal of timestamps or by logging ingested package into the system);
- Receive, update and maintain metadata about the document in the archive.

As mentioned several times, the platform is designed as a system of long-term preservation at the service of the Region of Tuscany, but also local government of the community. Which is why both of the two subsystems are designed as multi-entity, i.e., the only installation maintains complete logical distinction, even if it can manage archives and contextual archival metadata of several entities.

8. Governance

Such a many-sided system requires a governance able to ensure effective control and management. The system is complex in nature because of the role that it aims to perform, because of the plurality of treated subjects, the many different involved responsibilities, the complexity of functions at stake.

Consequently, the working group on DAX focused on what would be the best form of government of the system, moving from the organizational context of departure. A strong point was that the system had to be co-managed by the entities that produce the archives with a direct involvement in the Community. Every administration would have to retain full responsibility for its archive, even if the system has to be managed and conducted through a board of expert with appropriate skill. This board has to be a qualified and a recognized group, equipped to manage digital preservation system, supervising it from every point of view: organizational, technological, legal, political and about diffusion process. A group able to provide appropriate security guarantees, effectiveness of technology, accessing to adequate technical equipment and to professional training.

Since the beginning of the project, a number of activities and meetings have been scheduled, to support different subjects involved in the management of platform DAX. The idea was to encourage public administrations and their technicians to discuss and test the system according to their need, experiences, and resources.

These activities are coordinated by a highly specialized team, that has entrusted the management of the system, called Centro di Responsabilità per la Conservazione Digitale (CRCD) (Responsibility center for digital preservation). The CRCD ensures the process of long-term preservation and, especially, it takes charge of the definition of meta-information and archival rules. The board has the responsibility for the necessary adjustments of the system to international standards of long-term preservation, and for the

²⁹ In particular, CNIPA - Centro Nazionale per l'Informatica nella Pubblica Amministrazione, Deliberazione 2004, 19 February, n. 11, "Regole tecniche per la riproduzione e conservazione di documenti su supporto ottico idoneo a garantire la conformità dei documenti agli originali," art. 3 and 4.

updating of the system to any possible change in the Italian legislation. The CRCD is also in charge of the accreditation of DAX to the National Agency for the Digitization of Public Administration, as well as of the possible subsequent adjustments of the system to their requirements or to new international standards. The CRCD ensures consistency and compliance with safety plans, also in respect to privacy policies. Finally, as regards new applying institutions, the CRCD coordinates the deployment process and the activation of organizational process, as well as its operative start.

Four are the institutions which play an important role in the management of the DAX platform, each one with clear responsibilities: Soprintendenza Archivistica per la Toscana, Regione Toscana and the ICT companies involved in the project. In this respect, the CRCD encourages and coordinates the relationships among all these entities so that they can operate together consistently, sharing a common goal. Among these four, Soprintendenza Archivistica per la Toscana plays a crucial role, as it is an office of the central State which, according to the Italian law, is in charge of monitoring and protecting historical archives of all public bodies, disregarding their political level. Further relevant institutions participating in the project are, as mentioned, Regione Toscana and the ICT companies which deal with the functioning of the technological components, according to the directions issued by the CRCD. A fifth fundamental partner adds to these four basically stable partners: the public institution that decides to use the DAX platform for the long-term preservation of its archives.

In order to have all these entities operating consistently under a defined articulation of tasks, a formal subscription of an agreement is required. This agreement states roles and responsibilities of each partner, as it also states the rules for the common governance of the system and the compliance guidelines for interoperability. Further relevant documentation is the technical documentation provided for the activation and management of DAX, the manual for conservation, standards and the necessary repertoires: all of this proves to be crucial for digital preservation of archives.

The Road to Providing Access to Kenya's Information Heritage

Digitization project in the Kenya National Archives and Documentation Service (KNADS)

Francis G. Mwangi

Kenya National Archives

Abstract

This paper discusses how the Kenya National Archives and Documentation Service (KNADS) started digitizing its records in its quest to give access to millions of documents in its holdings. KNADS under the law has the responsibility of taking "all practicable steps for the proper housing, control and preservation of all public archives and public records in Kenya." (Cap 19 Laws of Kenya) The paper indicates that the purpose of the programme is twofold, to give access to the information contained therein and to preserve the original archival materials for posterity. The paper shows the work plan that KNADS adopted in digitising a part of its collection, it shows the different methodologies adopted by KNADS to achieve these objectives, and the challenges it has faced so far. It concludes by indicating that although considerable progress has been achieved by KNADS in ensuring that the most consulted records in its collection have been digitalized, there is a need to look for new methods of achieving its goal in a shorter period as well as giving access to those records it has digitized.

Author

Francis G. Mwangi was born in Kenya in 1967; currently he is the acting Deputy Director of the Kenya National Archives and Documentation Service, Administration and Finance. He is also the head of the Films and Audiovisual Records in the Kenya National Archives. He is a holder of a Master of Science Degree in Archives and Records Management from Kenyatta University, Nairobi.

1. Introduction

KNADS is a Department in the Ministry of State for National Heritage and Culture in Kenya. It was established by an Act of Parliament in 1965 to take all practicable steps for the proper housing, control and preservation of all public archives and public records of enduring value, and make them available for public access. (Public Archives and Documentation Service Act, Cap 19 Laws of Kenya)

The weight of this responsibility is rapidly changing in the current digital environment and has become a real challenge. It's worth noting that some of the archival records and media are old, brittle, and delicate that requires careful handling. It's therefore important that the Kenya National Archives and Documentation Service actively intervene to ensure that these records will be available today and in the future. The use of archives is the goal that all archivists would endeavor, but the availability of archives for use by the public, and indeed all other aspects of archives management depend on archives being properly preserved and cared for, and now being made available to the users all over the world through the techniques of today and therefore the need to digitize our records.

Traditionally archivists have shaped their preservation activities around the notion of Permanence; their objective has been to ensure the permanent preservation of archives. This is despite the fact that no record, no matter how well protected and cared for, enjoys an unlimited lifespan. Internal processes of decay ultimately defy even the most sophisticated intervention by archivists.

Since 2007, KNADS has been carried out a digitization programme. This has involved digitizing some of its oldest and heavily used archival materials, some dating back to more than 100 years. This

programme has resulted in the digitization of close to 12,000,000 documents of archival records (KNA/8/2 Vol.11). While this may sound a big number, it is a very small portion (3%) of the more than 400,000,000 pages of archival materials in the custody of KNADS. It should also be noted that digitization is both capital and labour intensive as will be shown by the paper.

2. Background

In 2007, the Kenya National Archives and Documentation Service (KNADS) decided to start digitizing the records of Coast province that are held at its Nairobi headquarters. They were estimated to number slightly over 1.7 million pages of both bound and loose pages. These records were selected because of their age and the heavy usage by clients; it was argued that reformatting them into digital copies would allow wider use and ease of access while preserving the original. Constant handling of these records by users over the years has rendered them to wear and tear. Continued usage of the original document would lead to their destruction. By digitizing these records, the original would safely be preserved while the digital surrogates would be used for access. By virtue of them being digital, it would be possible to produce surrogate, and derivative files without any damage to the original digital master. The digital object would then retain all significant information contained in the original document(s), and under appropriately stringent conditions related to migration, refreshing, and backing –up of the original file, it should survive over time.

2.1 Ease of Access

Demand for access to original materials, often termed as ‘primary source materials’ is increasing every day. Members of the public often require instant access to records. Archival records are mostly single copies and as such they cannot be accessed by multiple users at the same time. However, with digitization, it will be possible to avail these records to the users online where multiple users can access them. The trend worldwide in archival institutions has been to digitize and even make these records available in the internet where users can access them after paying a stipulated fee.

It is envisaged that the digitization will be undertaken at a very high archival-master level quality that will allow for multiple output (e.g., print, microfilm, access images, thumbnails, etc.) when need arises.

2.2 Baseline Assessment

A baseline assessment was carried out by the department to establish the nature of the source materials. About 30% of the records were found to be very fragile and brittle and therefore, they required special handling and equipment when scanning in order to avoid any damage. About 10% of the documents required wide format scanners as they were not of standard size. Big portions of the document were hand-written and therefore, Optical Character Recognition (OCR) would not be performed on them.

2.3 Project Outcomes

After these materials have fully been digitized, users will no longer need to access the original materials unless on very rare occasions to satisfy curiosity; for authenticity and legal purpose. It will also be possible to do full text searches on the records as they will be indexed and as such it will be easier to

automatically identify documents containing relevant information, something that is not possible with paper records.

3. Progress of Implementation

The first three years of the digitization project was outsourced to private firms. This was out of the fact that the department did not have internal capacity in terms of adequate skilled manpower and equipment. This period saw the digitization of over 10 million pages of archival records. The contracted firm used to have a workforce of over 40 people working in two shifts (day and night). In the last two financial years, the department decided to undertake the project in-house with view of developing internal capacity for sustainability. The department procured twenty computers, twenty medium duty scanners and one wide format scanner. The intention was to use the department's staff to undertake the exercise.

4. Roadmap to Digitization of the Records of Coast Province in the KNADS

4.1 Work Plan and Payments

Milestone one: Digitization of Coast Province Documents			
OBJECTIVE	RESPONSIBILITY	MILESTONE/INDICATOR	BUDGET (KES)
Pre-Digitization Accession 11 - 22 June 2007	Outsourced Company	1,685,000 pages unclipped, dusted, demagnetized and batched at KES. 0.50	842,500.00
Scanning 22 June – 10 August 2007	Outsourced Company	1,685,000 pages digitally captured, OCR. edited and indexed, KES. 2.00 per document.	3,370,000.00
Post-Digitization Accession 22 June – 15 August 2007	Outsourced Company	1,685,000 re-clipped, transported to storage and catalogued at KES. 0.25	421,250.00 100% payment on completion

4.2 Workflow

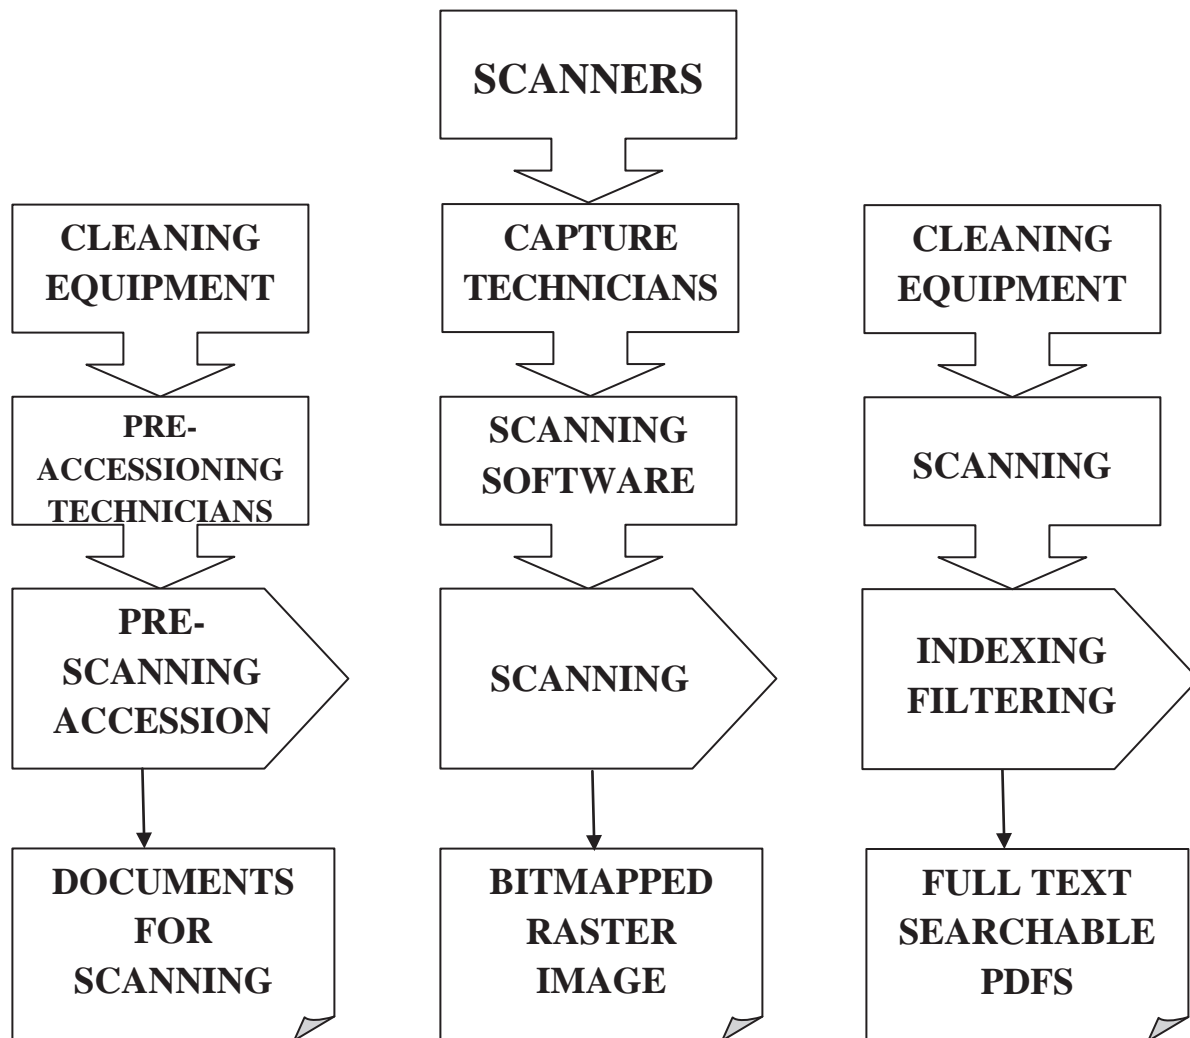

Figure 1. Workflow and events leading towards searchable document in KNADS.

5. Methodology

The first step was the preparation of the 1,685,000 documents through cleaning. Demagnetizing, unclipping and batching that mirror the output indexing and metadata.

The second step was scanning with various equipments according to documents specifications. All the originals 1,685,000 documents were scanned into digital master documents in TIFF CCTT4 format (resolution 6000 pixel – 8 bit greyscale) with lossless compression. The raster files were then saved into backup media repository.

The third step involved filtering the documents into the required formats. Filtered copies from the digital masters were made according to the needs. PDFs were done with metadata and full-text search

capabilities for retrieval done through OCR and documents schemas while GIF and JPEG thumbnails were created for intra/internet display. The work was divided into 5 objectives as shown below

5.1 Objective One: Pre-Digitization Accession

Input: 8 members of staff, vacuum cleaners and demagnetising hardware

Activities: 1. De-magnetising the documents
2. Dusting
3. Unclipping documents
4. Batching

Output: 1,685,000 clean unclipped and batched documentsin

Timeframe: Two weeks

5.2 Objective Two: Scanning

Input: 4 capture/editing technicians, scanners, computers and softwares

Activities: 1. Scanning
2. Editing
3. Indexing

Output: 1,685,000 indexed raster images

Timeframe: Eight weeks

5.3 Objective Three: Indexing and filtering

Input: 6 capturing/editing technicians and sorting staff

Activities: 1. Optical Character Recognition
2. PDF Conversion
3. Document Schemas and Metadata tagging

Output: 1,685,000 text/metadata searchable PDFs

Timeframe: Four weeks

5.4 Objective Four: Post Digitization Accession

Input: 6 re-clipping casuals

Activities: 1. Re-clipping documents
2. Transporting Documents
3. Arranging/Cataloguing documents

Output: 1,685,000 catalogued and achieved hard copies

Timeframe: Two weeks

5.5 Objective Five: Installation of Hardware

Input: 2 hardware & software engineers

Activities: 1. Installation of backup external disks
2. Installation of Server

Output: Configured Storage Hardware System

Timeframe: One week

5.6 Scanning Hardware Used

- 2 high duplex scanners capable of scanning 80 pages per minute, but given that these are archival document, the output is much less than that.
- 4 book scanners one being planetary capture scanner
- 1 wide format scanner (A0 size)

Storage Requirement: Master Documents – TIFF: 1685,000 pages x 2.4 megapixel = 3,840,000 megabytes = 3,840 gigabytes = 3.84 terabyte of space required

Filtered Compressed PDFs: 1,600,000 pages x 120kb

Software requirement: to manage the repository for retrieval, Adobe Acrobat and Acrobat Reader are being used.

5.7 Quality Assurance

A team of officers from KNADS were detailed to be carrying out quality control analysis at various stages of the project to verify that all reproduction is up to standard. The quality assurance analysis was carried out on random sample of 10% of all the stages. The quality assurance analysis were to determine the following:

- Size of image
- Resolution of image
- File format
- Image mode (i.e., colour images are in colour, not grayscale)
- Bit depth
- Details in highlights and in shadows
- Tonal values
- Brightness
- Contrast (e.g., stark black and white contrast on anything except simple line drawings)
- Sharpness
- Interference
- Orientation
- Noise
- Alignment of colour channels
- Cropped and border areas, missing texts, page numbers, etc.
- Alignment of images
- Missing lines or pixels
- Text legibility and meta data capture

6. Challenges

The following are some of the challenges faced during or immediately after finishing the scanning exercise.

- There were 1,585 wide format drawings and maps which had not been captured initially and which form part of the records of coast province. Since the drawings and maps are an integral part of the contents of the repository, these drawings and maps have to be scanned and according to the firm we had outsourced, the cost will be at KES. 150.00 per drawing/map, this was because the maps and drawings would require wide format scanners, after shopping around we found that the prize was actually KES 50.00 less than the market price.
- We also realized that there was another consignment of 190 boxes in the basement repository with 437,000 extra records of the same provenance, i.e., Coast Province which had not been captured in the initial count as they were in another repository. The cost of digitizing them was charged as the earlier records.
- We also needed to store, make backups and manage the electronic repository created with two 500GB external hard disks, one hundred and twenty 4 GB DVDs and PDF archival software, all totaling to an extra KES. 581,500.00
- Quality: while the contractor has been given the specs for digitizing the records, where mass digitization is taking place, quality may be compromised, especially given the fact that archival quality digitization requires a high resolution. This meant that an archives staff has to be within the process all the time. The work has to be checked again and again to ensure the right image is achieved always.
- Expenses: As will be seen, there are always “other” things and issues that crop up during or after the completion of a project. Therefore, apart from the original budget, extra funds have to be kept aside for such issues and things that are bound to arise.
- Consistency of the filing system: it was noted that during quality control, it should be ensured that the order in filling of the manual documents is maintained in the digital document, the documents in every file should be scanned from back to front just as the file has grown., where a document has more than one folio, the scanning should start from page one of the last page and in order to ensure that this was done properly, the departmental committee dealing with monitoring and evaluation of digitization programme was to closely and regularly visit the site and assess the progress.
- Re-boxing and re-shelving of files: this is a major challenge during a digitization exercise especially where the services have been outsourced. The archives developed a stamp having the inscription ‘verified’, ‘date’ and ‘signature’ and the re-shelving team had to look and ensure that the records have been digitized before they are returned to their boxes.
- Outsourcing: While it is appreciated that outsourcing resulted in the digitization of over 10 million documents within three years, the exercise was very expensive and yet there was no specific budgetary allocation for the project. This meant that the project could not be sustained through outsourcing.

- **In-house Project:** The initial intention was to deploy officers from other sections to carry out the digitization on a rotational basis. The officers could not afford to dedicate adequate time for the exercise since they already had other duties to take care of in their respective sections. The department, therefore, resorted to hiring of casuals to assist staff in the digitization exercise. The money allocated during the last two financial years for hiring of casuals is a cumulative total of 3 million shillings. This figure has only been adequate to hire 20 casuals for a total 9 months. This implies that half of the year no digitization takes place yet the total number of people undertaking the exercise is only half what the external contractors used to have. Furthermore, considering that the programme is long-term, it is also not sustainable to use casuals year-in year-out.
- **Access:** although the primary reason for digitization was to offer access and preservation of the original, the actualization has been slow. This is because of the following reasons:
 - **Website:** The Kenya National Archives and Documentation Service website had been hacked and it took time constructing another one.
 - **Content:** hosting the website with all these data content became an issue, the capacity of most of our service providers was low and as such they could not handle our request.
 - **Technological Challenges:** there was no one who seemed to know exactly how to go about uploading the material that we wanted uploaded without compromising the rest of the material in the server.
 - **Payment and Charges:** if we were to charge for the material accessed, how would we go about it and what modes of payment would be accepted, noting that this is a government department.

7. Way Forward

Long-term solutions to the digitization project needs to be found with a view of ensuring that it is sustainable. These would include the following:

7.1 Personnel

To clear the huge backlog of 97% of un-digitized materials, the department would require engaging 200 staff on a full time basis. That number of staff would be able to digitize 200,000 documents per day at the rate of 1000 per person. At that rate, the department would be able to clear the backlog in five years.

7.2 Training

Digitization is a technical area that requires professional skills to ensure quality output. It is therefore important for all the staff engaged in the project to undergo thorough training in digitization both at middle and advanced levels.

7.3 Equipment

While the department has already acquired digitization equipment, these would not be adequate if the department was to acquire the desired number of staff. It would therefore be necessary to acquire more

equipment. Additionally, ICT equipment becomes obsolete very fast. It is therefore important to budget for the upgrading and replacement of the equipment that are no longer serviceable.

7.4 Budget

As noted earlier, digitization is a capital intensive project and as such the department needs to introduce a specific budgetary item for this purpose with adequate allocation to cater for its needs.

7.5 Partnership

Another way of going about the digitization programme is to partner with stakeholders and friends of archives wherever they may be, the partnership can be in form of assistance, technical knowhow, equipment, financial or any other way that can be offered to make the programme a success story.

8. Conclusion

Since archival material exist in single copies, they had to be handled with utmost care. For this reason automatic document feeders were avoided, unless the papers were in a very good physical conditions and of standard size. Another rider adopted was re-assembling back of all the documents into their respective files and the cover of the file stamped 'digitized'. Finally, since the files are read from back to front, digitization had to be done in the same way with folio one starting off till the last folio to be filed becomes the last.

Though it had been hoped that by undertaking the exercise in-house the challenge of sustainability would be resolved, this has not been forthcoming as the department is too thin on the ground in terms of personnel. Hiring of casuals was an appropriate stop-gap measure but it is also not sustainable in the long run. It is, however, worth noting that the department now has adequate equipment for digitizing records. However, the challenges of internal capacity need to be resolved with long-term solutions that would make the project sustainable. The international partners and friends are invited to assist the archive move a step further than where we are by making what we have already digitized available to the world.

A Preservation Infrastructure Built to Last

Preservation, Community, and HathiTrust

Jeremy York

Project Librarian, HathiTrust

Abstract

This paper describes the strategies HathiTrust is taking to build a collaborative infrastructure capable of ensuring long-term access to digital collections at scale. HathiTrust's approach recognizes the deep interplay of social and technical factors that support our collections, and will determine their persistence and availability over time.

Author

Jeremy York has been the project librarian for HathiTrust since July 2008. His primary duties include project coordination among the partnership, maintenance of HathiTrust's informational web site, and activities surrounding new partners and partnership contracts. Jeremy received a bachelor's degree in history from Emory University in 2001 and a Master of Information Science from the University of Michigan in 2008, with a specialization in archives and records management.

1. Introduction

HathiTrust is a partnership of academic and research institutions that are pooling resources to collaboratively preserve and provide access to the cultural record. The core of the preservation strategy centers on a digital repository that is owned and operated by the partners to ensure the long-term preservation of digital materials owned by their institutions, and facilitate access to the greatest degree allowed by law or third party agreements. The repository was launched in 2008 and currently contains more than 10 million volumes, making it one of the largest research library collections in the world. This paper offers insights into the guiding principles and ideas that underlie the repository, and specific strategies the partners are employing to preserve and provide access to digital collections at such a scale.

2. Setting

In the last 10 years, the time in which HathiTrust was conceived and initiated, there has been an explosion in the amount of materials digitized and produced digitally by libraries and other cultural heritage institutions. This has resulted in an increased focus in the cultural heritage sector on issues of digital preservation. Libraries and other institutions have grown significantly in their knowledge of the specific components involved in digital preservation, such as formats, media, and management of digital objects over time. They have grown also in their understanding of, and tools for evaluating, attributes and characteristics of "trustworthy" initiatives for long-term preservation. The challenges of preserving our digital present and past have been increasingly well defined. However, questions remain about the best ways to meet these challenges, from preservation models to employ (e.g., distributed versus centralized architecture), to formats and technologies to use, to specifications and best practices to follow.

In seeking to address these challenges, and in building a preservation infrastructure designed to operate at tremendous scale, HathiTrust has taken an approach that recognizes preservation first and

foremost as a social and collaborative activity. This approach has led to technological, architectural, and procedural decisions that, while important in their own right, are subordinate to, and guided by, an overall aim to meet the needs of a targeted community, even as the needs of that community change over time. This paper walks through the specific strategies that HathiTrust is taking to address common challenges in digital preservation, including issues of authenticity, reliability, scalability, sustainability, and discovery and access, in light of two guiding principles: that it is we, collectively, who are responsible for ensuring the persistence and availability of our cultural record; and that we can do more together than we can do separately.

3. Community

Viewed developmentally, the problem of preserving digital information for the future is not only, or even primarily, a problem of fine tuning a narrow set of technical variables. It is not a clearly defined problem like preserving the embrittled books that are self-destructing from the acid in the paper on which they were printed. Rather, it is a grander problem of organizing ourselves over time and as a society to maneuver effectively in a digital landscape. It is a problem of building—almost from scratch—the various systematic supports, or deep infrastructure, that will enable us to tame anxieties and move our cultural records naturally and confidently into the future.

(Task Force on Archiving of Digital Information 1996, 7)

The quote above is taken from the 1996 report of the Task Force on Archiving of Digital Information—a report foundational to the establishment of criteria for certifying trustworthy digital repositories, and significant in the development of the framework for Open Archival Information Systems.¹ One of the primary focuses of the report was on the need to advance the establishment of trusted systems for preserving digital information (1996, 9-10). As the quote above demonstrates, the report also recognized the social framework and interplay of social factors that both support and benefit from trustworthy digital preservation.

The importance of both of these aspects, the technical and the social, are carried forward in the OAIS model and in Trustworthy Repositories Audit and Certification: Criteria and Checklist (TRAC), the culmination of many years work to establish criteria for certifying trustworthy digital repositories. It is significant, however, that social components in both of these models are articulated primarily in a service-consumer relationship. The OAIS model defines a repository's Designated Community as "an identified group of potential Consumers" of information, where Consumers are the "persons, or client systems, who interact with OAIS services to find preserved information of interest and to access that information in detail" (Consultative Committee for Space Data Systems 2002, 1-8). The Designated Community is specified separately from a Management function, which typically acts to provide funding, conduct reviews of the OAIS, determine pricing policies, and "provide support for the OAIS by establishing procedures that assure OAIS utilization within its sphere of influence" (2002, 2-8).

In TRAC, one of the three overarching areas comprising the evaluation is organizational infrastructure, including issues of governance, staffing, finances and sustainability, contracts and liability,

¹ The report was the source of the recommendation to institute a dialogue on the "standards, criteria and mechanisms needed to certify repositories of digital information as archives" (1996, iv), and is taken as a point of reference in the Trustworthy Repositories Audit and Certification: Criteria and Checklist (CRL and OCLC 2007, 1). It was also the basis for the Preservation Description Information in the OAIS model (Consultative Committee for Space Data Systems 2002, B-1).

and succession (CRL and OCLC 2007, 3). TRAC explicitly recognizes the social elements that underlie a trustworthy repository. TRAC borrows the definition of a Designated Community from OAIS, however, reasserting from an earlier 2002 report (RLG and OCLC 2002) that “the definition of a trusted digital repository must start with “a mission to provide reliable, long-term access to managed digital resources to its designated community, now and into the future” (CRL and OCLC 2007, 3). Here too, the envisioned relationship is weighted toward one where an organization (stakeholders fulfilling management functions) provides services to a separate body of end users.²

The notion of Designated Community does not exclude the idea or possibility that designated communities and stakeholder communities could be the same, but it is worth affirming this possibility explicitly, as it is precisely the model under which HathiTrust was established and operates. The partnership is a community of academic and research institutions that are collaborating to provide a shared digital preservation infrastructure that will enable them to better achieve their goals in provisioning the cultural record for the advancement of scholarship at their institutions. By doing this, the partnership serves immediate access needs of end users who are part of this community (those engaged in scholarship and research at the partnering institutions, including, as they may be, stakeholders, staff, students, and faculty, etc.). HathiTrust’s Designated Community, then, encompasses both those who steward and manage the digital archive, and the immediate users of information contained within the archive. As the partners are committed to using their collaborative services to produce public goods (making materials in the digital repository as open and available to anyone in the world as possible), they are able to reach beyond their designated community to serve a broader worldwide audience of libraries and library users.

There are clear strengths to this arrangement, where there is a tight coupling between those who support and manage the archive, and those who use and benefit from it. Perhaps the most important of these are first, that it provides the basis for a deep, collaborative social infrastructure where institutions are able to leverage common interest, distributed expertise, and diverse resources to achieve common and institution-specific goals more effectively and efficiently. Second, it creates strong forces that favor long-term sustainability. The sustainability of the archive depends on the ability of shared management and governance to ensure the archive continues to benefit the investing partners, and on the continued interest of the community in general in supporting scholarship and research. Both of these are fundamentally social factors.

A key element in ensuring the archive’s ability to benefit those supporting it, however, is the technology used and the archive’s technological approach in general. As the 1996 Task Force report noted, “We can afford to continue and increase economic and social investments in digital information objects and in the repositories for them on the information superhighway if, and only if, we also create the archival means for the knowledge the objects and repositories contain to endure and redound to the benefit of future generations” (1996, 9-10).

The remainder of this paper describes the approaches HathiTrust has taken to address challenges in preserving and providing access to digital information at scale in light of the social factors that ultimately underlie its success and sustainability. The partners have striven to develop robust technological infrastructure that is designed above all to be responsive to community needs for preservation and access, and that prioritizes meeting these needs over the long-term, even as technologies and implementations change over time.

² Examples given in OAIS of Consumer interactions include “questions to a help desk, requests for literature, catalog searches, orders and order status requests” (Consultative Committee for Space Data Systems, 2-9, 2-10).

4. Overarching Considerations: Scale, Preservation and Access, Openness

There are three broad considerations that have had a significant impact on the design and implementation of the HathiTrust repository. All result from underlying goals to meet the needs of the designated community. These considerations are the exceptional scale of the repository, a philosophical belief that the value of preservation is gained through access—that there is no value to a community of preservation without access, and a strong commitment to openness. Ultimately, HathiTrust’s need-based approach to the development of services and strategic directions is one of its strongest attributes.

4.1 Scale

In his testimony as part of the Google Settlement fairness hearing in 2010, Paul Courant provided a summary of the purpose of the libraries that were engaging in large-scale digitization of their collections in partnership with Google. The excerpt of his testimony below characterizes well the primary needs of HathiTrust’s designated community:

Without reliable access to the scholarly record, we cannot know what has been known, what has proved fruitful and fruitless in the past. The broad social benefit that derives from the progress of science and the useful arts depends on the ability to find, use, and reuse the scholarly record. Provision of the scholarly record for current and future generations is the primary mission of these research libraries. (Courant 2010)

This statement highlights the needs of researchers and scholars to discover, access, and cite the scholarly record over time, and of libraries to preserve the scholarly record and enable these activities. Something that immediately stands out about these needs is the expansive scope. The needs are not to preserve works from a particular country or time, by a particular author or set of authors, or in a particular format or medium (for instance print or analogue versus digital, or even born digital). The needs relate to all materials that can be used to further scholarship. HathiTrust acknowledges the scope of these needs in its broad mission “To contribute to the common good by collecting, organizing, preserving, and communicating the record of human knowledge” (HathiTrust n.d.a.). It acknowledges these needs also, and some particular points of strategy in addressing them, in its initial goals. One of most important points of strategy is that the effort to address the needs of HathiTrust’s designated community should and must be collective: “co-owned and managed” as the goals state, by the institutions ultimately responsible for the digital archive. The goals are as follows:

- To build a reliable and increasingly comprehensive digital archive of library materials converted from print that is co-owned and managed by a number of academic institutions.
- To dramatically improve access to these materials in ways that, first and foremost, meet the needs of the co-owning institutions.
- To help preserve these important human records by creating reliable and accessible electronic representations.
- To stimulate redoubled efforts to coordinate shared storage strategies among libraries, thus reducing long-term capital and operating costs of libraries associated with the storage and care of print collections.

- To create and sustain this “public good” in a way that mitigates the problem of free-riders.
- To create a technical framework that is simultaneously responsive to members through the centralized creation of functionality and sufficiently open to the creation of tools and services not created by the central organization. (HathiTrust n.d.a)

The initial goals center broadly around collections and collaboration: assembling a digital collection of materials, as comprehensive as possible; providing access to the materials; preserving them; and then using the materials in broader strategies that benefit first the partners, and by extension a larger worldwide community. Libraries’ goals to improve access to materials (including discovery and use) require their willingness and ability to address a number of specific micro-level challenges such as proper identification, description, and rights determination of materials (gaining a knowledge of what we have in our collections). Understanding what we have in our collections, the relationships between individual items, and the items’ rights statuses are precursors to the development of individual and collective strategies for macro-level challenges such as managing print and digital collections, expanding of lawful uses of in-copyright materials, and in general, improving our collective preservation infrastructure. The common characteristic of all of these challenges and strategies is that they are *big*. They lend themselves to, and can be best responded to by, collective action, at scale. Partnering Institutions support HathiTrust specifically as a platform to address their needs in these areas and facilitate this kind of collective action.

4.2 Preservation and Access

HathiTrust is a “light” archive and as such, strives to provide as much access as legally possible to all materials in the repository. Works that are determined to be in the public domain, or that rights holders have opened access to, are available to be read online as well as downloaded, subject to third party agreements.³ HathiTrust recognizes legal constraints and contractual obligations on materials, but does not preserve materials that depositors would wish to be stored without access, when access might otherwise be lawfully granted. For works that are in-copyright, HathiTrust includes full-text OCR in its repository-wide full-text search index, so that even though they are not available for reading or download, in-copyright works can be searched to retrieve word or query frequencies that may assist in determining the relevancy of a work or in locating specific information in a hard-copy of the work.

HathiTrust’s “light” orientation benefits users, as it provides access to a tremendous body of materials. It also has benefits for preservation, as the processes of retrieving and displaying data provide an additional check on the integrity of objects, and access in general gives the digital objects the best chance to be used and valued in the community, and therefore preserved into the future. The goal of providing access to preserved works manifests itself in numerous ways throughout HathiTrust’s technological infrastructure.

4.3 Openness

The last of HathiTrust’s goals speaks to a technical framework that provides significant centralized functionality, but is also open to distributed development of tools and services. This orientation and

³ Full download of materials is available where no restrictions exist. In most cases Google-digitized materials, which make up the largest group of materials where restrictions exist, are only fully downloadable by members of HathiTrust partner institutions.

general strategy towards openness extends to all aspects of the repository, from content formats to hardware and software, to organizational structure. The general strategy is that the long-term sustainability of the repository is served to the degree to which it is possible for member institutions to make use of the collective assets and services of the partnership, and to contribute to and manage them as well. The impact of HathiTrust's strong commitment to openness will be discussed further below.

5. Technical Infrastructure, Social System

HathiTrust's technical infrastructure was designed to meet the needs of its designated community, which can be categorized broadly on one hand as reliable long-term access to materials, and on the other as more efficient management of materials and resources to this end. This needs-based approach has resulted in a step-wise, modular trajectory to repository development, where discrete components that fulfill the needs for preservation and access interoperate as an integrated whole.⁴ It has also resulted in very practical decisions about these components that are fully cognizant of the concerns (including economic, technological, and sociological) of the designated community. The ways that HathiTrust has addressed core challenges in digital preservation, as articulated by the Task Force on Archiving of Digital Information's report in 1996 (which, as it has been noted, was a significant force in the development of TRAC and was used in the development of the OAIS model) is given below. It will be helpful before entering into a discussion of these elements to give a general description of the architecture and design of the repository.

5.1 Repository

The HathiTrust repository was developed according to the framework for Open Archival Information Systems and the Trustworthy Repository Audit and Certification criteria. The overall considerations for operation at scale, preservation and access, and openness have resulted in a strong drive for consistency and standardization across the repository. Consistency and standardization facilitate the operation of generalized processes across the repository for purposes of ingest and preservation (e.g., content auditing and reporting, replication, backup), as well as access (e.g., full-text search indexing, access to users through a variety of interfaces, collection-building capabilities). The major components of the infrastructure, shown in Figure 1, include:

- Ingest: processes check the fixity of objects received for deposit, transform them to HathiTrust specifications if needed, perform rigorous validation, package objects for ingest, and finally bring them into the repository.
- Archival Storage: HathiTrust storage consists of two geographically separated instances of the repository on spinning disk, with tape backup stored in a third location.
- Data Management: HathiTrust manages bibliographic and rights information about objects, as well as information about the print holdings of partner institutions that correspond with HathiTrust's digital holdings. The significance of managing partner print holdings will be discussed further below.

⁴ See York 2010 for a detailed discussion of repository architecture.

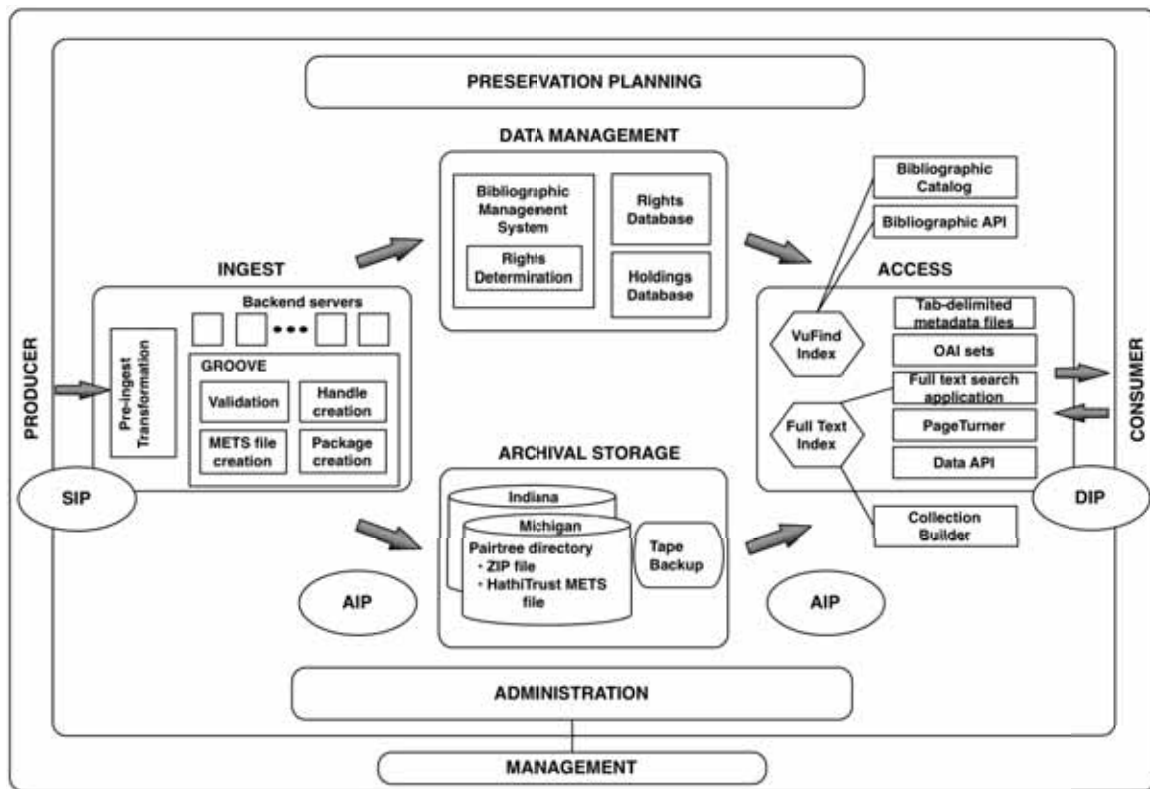

Figure 1. HathiTrust architecture according to the OAIS model (York 2010).

- Access: access services include
 - Bibliographic and full-text search of all materials
 - Reading and download capabilities for public domain and open access materials
 - The ability to assemble virtual collections of materials (i.e., “book bag” functionality)
 - A variety of APIs and data feeds for both bibliographic data and repository content (images and OCR text)

5.2 Preserving Digital Information

In describing the overall landscape of digital information and preservation, the Task Force on Archiving of Digital Information notes that:

The process of preserving digital information will vary significantly with the different kinds of objects – textual, numeric, image, video, sound, multimedia, simulation, and so on – being preserved. Whatever preservation method is applied, however, the central goal must be to preserve information integrity; that is, to define and preserve those features of an information object that distinguish it as a whole and singular work. In the digital environment, the features that determine information integrity and deserve special attention for archival purposes include the following: content, fixity, reference, provenance, and context. (1996, 13)

Each of these elements, content, fixity, reference, provenance, and context, will be taken in turn.

5.2.1 Content

With regard to content, the Task Force states:

The measure of integrity in the preservation process thus turns, at least in part, on informed and skillful judgments about the appropriate definition of the content of an digital information object—about the extent to which content depends on its configuration of bits, on the structure and format of its representation, and on the ideas it contains—and for what purposes. (1996, 13)

At the broadest level, considerations about content in HathiTrust begin with what is selected for digitization and preservation. The materials ingested by HathiTrust to-date have been those digitized and submitted individually by the partnering institutions (i.e., materials determined by those institutions to be of enduring value). HathiTrust formed a Collections Committee in 2010, however, whose charge includes making recommendations about content in HathiTrust (HathiTrust n.d.b), and partners recently approved a targeted initiative surrounding United States federal government documents (HathiTrust n.d.c). These initiatives underscore opportunities for collective decision-making about the addition of materials to the repository in the future.

Apart from selection of materials at an intellectual level, HathiTrust has defined parameters for the general types of materials as well as the content formats and specifications that are accepted. The general types of materials HathiTrust preserves at a production level currently are digitized books, journals, and book-like materials, such as codex manuscripts. Pilot projects involving image (e.g., maps and photographs), audio, and born-digital content are underway. For the books and book-like materials, there are only three formats in the repository that are primary targets of preservation: ITU G4 (bitonal) TIFF images, JP2 images, and Unicode text (HathiTrust volume packages include both plain text Optical Character Recognition (OCR) text and OCR with word coordinate location information). HathiTrust enforces adherence to these formats (including validity), minimum resolution standards, and internal image metadata specifications through rigorous validation processes on ingest. The specific types and numbers of formats in HathiTrust are not important in and of themselves (HathiTrust will undoubtedly support more formats and types of materials at a production scale over time), but are important the degree to which they satisfy a variety of community concerns. For example, ITU G4 TIFF, JP2 and Unicode are standard and open formats that meet community-accepted standards for digital preservation. They are also widely supported on a number of platforms and not dependent on particular hardware or software to render to users. These attributes of the formats inspire confidence in the community in their ability to be preserved and migrated forward to new preservation formats over time.

The formats HathiTrust accepts express its orientation toward openness, which in this case facilitates preservation of materials. The openness of formats facilitates access to materials as well, however, and access in particular at scale. The openness and flexibility of the formats allows them to be transformed on the fly to formats that can easily be downloaded or displayed to users on the Web. Management of files is thus simplified, as derivative images do not need to be stored in the repository, and repository systems do not need to be developed to maintain and disseminate them. The openness of the formats allows a uniformity of content across the repository that lowers the overhead of cross-repository management functions while offering a variety of access options to users.

It is relevant to note that HathiTrust has benefitted greatly from the uniformity of Google digitization with regard to content format and standards. The fact that millions of volumes have been digitized in the same way to the same specifications has greatly facilitated rapid growth of the repository (HathiTrust has

grown overall from 2.5 million volumes from its launch in 2008 to 10.5 million in 2012). HathiTrust has encountered challenges when seeking to accept content digitized from other sources, even when those sources use the same formats. This is due to the issues and work involved in transforming content to meet HathiTrust specifications, including assembling content and metadata into HathiTrust content packages. The collective work of the HathiTrust community has been key in addressing this challenge.

HathiTrust partners have worked closely together to define specifications and process for transforming content from large-scale digitization sources such as the Internet Archive, and develop tools, available from the HathiTrust website (HathiTrust n.d.d), that allow partners to transform, validate, and package content that is digitized on a smaller scale to HathiTrust specifications prior to submission. Working collaboratively, HathiTrust institutions have developed a framework that allows institutions to participate deeply in the preservation of their content, while lowering the overall costs to the repository of staging and transforming content, some of the highest costs associated with digital preservation repositories.

5.2.2 Fixity

Fixity in the Task Force report refers to the way content is “fixed as a discrete object,” with the concern that objects might be changed or corrupted without notice (1996, 14). The concept of fixity relates closely to the concept of authenticity, as articulated by Luciana Duranti (Duranti 1995) and authenticity and integrity, as discussed by Clifford Lynch (2000). These relationships will be explored more closely below.

HathiTrust verifies the fixity of objects internally at several levels. The first is through verification, when possible,⁵ of checksums for content as a part of the ingest process (calculating a message digest for content in the Submission Information Package and comparing it with the digest provided with the content). The second is by periodically re-calculating the checksums of objects in the repository and comparing them with checksums generated prior to ingest.⁶ The third is through data integrity mechanisms internal to the storage itself, which use checksums to ensure that data transferred from one storage site to another are not corrupted, and to detect and automatically repair errors, including those caused by “bit rot” phenomena such as misdirected or torn writes.

HathiTrust communicates fixity, to a degree, to users as well, through the use of watermarks on images displayed in or downloaded from HathiTrust Web interfaces. The watermarks are not actually inscribed into the images themselves; they are overlaid on derivative images when the derivatives are created from the master files. It is thus possible to tell from the Web and printed copies that the images came from HathiTrust, although the watermarks do not have meaning for internal tracking.

These represent some of the mechanisms HathiTrust has in place. As Clifford Lynch has discussed, however, issues of authenticity and integrity at their base are largely functions of trust and context (2000). In discussing checks of internal consistency using checksums that are calculated for objects, he notes that when such a checksum or digest is used, “our confidence in the integrity of the object is only as good as our confidence in the authenticity and integrity of the digest.” In such a situation, the link between the claim that a message digest is correct and the claim that an object maintains its integrity “is done by association and context—by keeping the claim bound with the object, perhaps within the scope of a

⁵ It is possible that materials desired for ingest are not accompanied by valid checksum information.

⁶ Checksums are recorded in metadata that is stored with objects in the repository.

trusted processing system such as an object repository.” Put in other words, it is within a trusted environment that claims of authenticity and integrity have their meaning.

HathiTrust uses automated checks on integrity to detect random or accidental corruption of objects in the repository, but these mechanisms would likely not be sufficient to ensure integrity in the event of a successful intentional attempt to corrupt content. HathiTrust’s multiple levels of redundancy (multiple storage locations and backup) could be used to restore any or all objects in the repository following such an act. A key point regarding fixity, however, is that it is broader mechanisms of system security (to prevent malicious forces from outside) and trust in staff (to ensure security from inside) that ensure the integrity of the overall environment, and give validity to further internal checks that are performed. As the fixity and integrity of objects depends to a significant degree on trust in the people and social system (the libraries) operating the repository, it is essential for the libraries participating in HathiTrust to maintain the trust of the community in this social system, as well as and including the technical systems it has in place.

5.2.3 Reference

With regard to reference, the Task Force states: “For an object to maintain its integrity, its wholeness and singularity, one must be able to locate it definitively and reliably over time among other objects” (1996, 15). HathiTrust addresses issues of reference in several ways. The first is the way items in the repository are identified. When an object enters the repository it is assigned an identifier that is composed of the identifier for the object prior to when it entered the repository, if available, and a namespace. HathiTrust prefers to use identifiers for objects that are in use by the depositor (in the case of digitized books this is often the barcode of the physical volume) if they have good identifier qualities, including guaranteed uniqueness (HathiTrust n.d.e). This is to avoid maintenance that would be involved in mapping and updating HathiTrust-generated identifiers, and to facilitate references by institutions to representations of their materials in HathiTrust. Namespaces are selected by the depositor and are used to identify the depositing source, as well as distinct identifier schemes of submitted objects. If items from a depositor have more than one identifier scheme, more than one namespace is used (HathiTrust n.d.e). As an example, the University of California uses the namespaces “uc1” and “uc2” to distinguish volumes digitized by Google and by the Internet Archive, each of which have distinct identifiers schemes. An example of an identifier in each group is given below:

uc1.b3543486 (Google-digitized)
uc2.ark:/13960/t26973133 (Internet Archive-digitized)⁷

HathiTrust thus takes great care to ensure the unique identification of items in the repository and enable references to original items where possible.

HathiTrust further enables reference through the structure of the repository. The objects in HathiTrust are stored in directories in one large file system. The repository uses a Pairtree structure, which maps identifier strings to directory paths for digital objects pair-wise, with the name of the final directory being the object identifier (Kunze et al. 2008). For example, the path on the repository file system to the directory of the item “uc1.b3543486” is ../uc1/pairtree_root/b3/54/34/86. The files of the object itself are located in this directory and named b3454386.zip and b3454386.mets.xml. The zip file contains the content files of an object—the images and OCR for digitized books—as well as additional

⁷ These are the same examples used in York 2010.

content metadata. The XML file contains a variety of technical, administrative, and structural metadata encoded in the Metadata Transmission and Encoding Standard (METS) (Library of Congress n.d.a), that serve purposes both of preservation and access.⁸ There are several benefits to using the Pairtree structure, including that it a) ensures that objects are uniformly accessible to repository systems and access services; b) makes it easy for content to be imported, understood, and used in new storage system without the system knowing anything about the nature or contents of the stored objects; and c) allows object operations such as backup and restore, to be performed using native operating system tools, facilitating disaster recovery (Kunze et al. 2008). These benefits have clear advantages for reference, as objects can be located and operated on through automatic processes. They also inherently facilitate operation at scale, preservation and access, and openness—openness to the degree that HathiTrust objects are not tied to the specific infrastructure they are stored on and could either be operated on by tools independent of the software used in current storage, or moved to totally different storage and operated on immediately.

There are three further ways that HathiTrust facilitates reference. The first is by embedding the identifier of objects in the metadata of images that make up digital volumes themselves.⁹ The second is through the creation of unique and permanent identifiers for objects using the Handle System (Corporation for National Research Initiatives, n.d.). Permanent identifiers comprise a Handle namespace and the HathiTrust identifier, which are combined together to form a permanent URL where the object can be located on the Web. HathiTrust also provides the date of the most recent version of the volume in HathiTrust, facilitating citation (versioning is discussed in the section on Provenance below).

As in other areas, the mechanisms that HathiTrust uses to facilitate reference depend on broader social factors—for instance, the selection and use of identifiers by depositing institutions; the reliability of the Handle service. By taking a stance that is sensitive to these factors (e.g., favoring the use of existing identifiers, using a uniform scheme of structure and reference in the repository), HathiTrust positions itself to be responsive to them and as needs for and applications of reference capabilities change over time.

5.2.4 Provenance

The Task Force report highlights two ways that establishing the provenance of objects serves to preserve their integrity:

First, a tracing of chain of custody from the point of creation helps to create the presumption that an object is authentic, that it is what it purports to be and that its content, however defined, has not been manipulated, altered or falsified (Duranti 1995: 7-8). The second effect of establishing provenance through a chain of custody is to document, at least in part, the particular uses of the object by the custodians. (1996, 17)

HathiTrust traces the provenance of digital objects by recording the original source of the material represented in HathiTrust, the agent of digitization, and a variety of administrative (including provenance and preservation) metadata about objects, where this metadata is available.¹⁰ HathiTrust uses the

⁸ Details about HathiTrust content packages, and the metadata contained in the XML file are available at (HathiTrust n.d.f). See also York 2010.

⁹ In the `DocumentName` element of TIFF files and the `dc:source` element of JP2 files.

¹⁰ At a minimum, HathiTrust requires information about the digital capture of items. An explanation is needed if this information is not available. HathiTrust accepts other information relevant to provenance and preservation of materials prior to their entry into HathiTrust, but does not require it.

Preservation Metadata: Implementation Strategies (PREMIS) standard (Library of Congress, n.d.b) to record preservation metadata, including the time and date of digital capture, transformations that may have been performed, fixity checks, validation, quality review, and other events that may occur either prior to HathiTrust taking responsibility of a digital object or subsequently.

HathiTrust does not keep multiple versions of objects in the repository.¹¹ If a new version of an object is available for ingest, as is often the case in particular with Google-digitized volumes,¹² the new version overwrites the existing version. A new series of preservation events (e.g., fixity check, digest calculation, validation, and ingest) is written into the PREMIS metadata for the re-ingested object, and all previous events are retained, providing a means to determine whether and how many times an object has been ingested. HathiTrust uses this practice primarily because of the immense scale of the repository and the frequency with which volumes from Google are reprocessed and made newly available. The cost of preserving multiple versions of Google-digitized volumes would drastically increase the cost of preservation to partners, and the value of retaining these versions is not clear. For instance, it is important for users to be able to reliably cite the version of an item that they used (a version date is provided for this purpose as mentioned above). It is also important for HathiTrust to record changes that are made to volumes where possible.¹³ Whether or not it is important to record Google's or another entity's attempts to create a reliable representation of a known object is a separate question. The Task Force report acknowledges the relationship between documenting provenance and the concepts of fixity and authenticity, and factors affecting and complicating notions of authenticity have been discussed in the section on Fixity above. It is worth exploring these factors a little more deeply, however, particularly in relation to the concept of reliability, as it relates to issues of versioning and is raised in the article by Duranti that the Task Force cites.

A primary point that Duranti makes in the article is that the “concepts of authenticity and reliability must be kept intellectually separate”¹⁴ A danger in conflating the two, or of focusing primarily on the integrity and authenticity of records, is that records may be completely authentic, but this does not mean that they are reliable (1995, 7). Duranti states that, “A record is considered reliable when it can be treated as a fact in and of itself, that is, as the entity of which it is evidence” (1995, 6). According to Duranti, the elements that provide a record with reliability are its form and its procedure of creation (“the body of rules according to which acts or portions of them are recorded”) (1995, 6). Duranti notes, “A record is regarded as reliable when its form is complete, that is, when it possesses all the elements that are required by the socio-juridical system in which the record is created for it to be able to generate consequences recognized by the system itself.” Some elements that commonly contribute to form are signature and date

¹¹ Versions here refer to multiple different copies of a distinctly identified object (for instance, one version of an object that is missing a page and a corrected version that is not). HathiTrust does preserve multiple editions of the same work, as well as multiple copies of the same work that are in the repository under different identifiers (i.e., duplicate volumes).

¹² Google is constantly improving the algorithms it uses to process the raw images it captures of library volumes. When new versions of volumes from any institution are available, if they pass a certain quality threshold, they are re-ingested into HathiTrust.

¹³ The partners have observed a trend in higher quality scans returned from Google over time, but an automated mechanism to determine whether or how much the quality of a given volume has changed following reprocessing by Google (and correspondingly, what specifically has changed) does not exist. This can only be determined through manual inspection, though many minute changes would likely not be detectable.

¹⁴ (Duranti 1995, 8). Duranti's concern is primarily with electronic records, but many of the same concerns apply to digitized volumes.

of creation. Procedures of creation might include appropriate responsibility for signing, recording of facts by multiple persons, or distribution to multiple addresses (1995, 6). Duranti states that the same elements, completeness of form and procedure of creation, determine the reliability of copies that are made of originals, and acknowledges that there are different degrees of reliability, ranging from a simple copy made “without the dating and attestation of the copying person,” to copies that might be more reliable than the originals themselves (1995, 7).

The digitized volumes found in HathiTrust are intended to be copies of the original physical volumes.¹⁵ However, while HathiTrust records the date images of original volumes were created, in most cases (except when files are received directly from the publisher) there is no official entity that verifies the reliability of the copies with respect to the way they represent the originals. In the socio-juridical context of library digitization, the reliability of digital copies, their ability to stand for the items they represent and to generate consequences (i.e., be cited and used as surrogates for the physical volumes), has generally been established by libraries through quality assurance. Whether libraries conduct the digitization of items themselves or contract with a vendor, there is an underlying assumption, because of the trust society places in libraries and libraries’ living up to this trust over time, that appropriate steps have been taken to ensure that digitized copies accurately represent the original items, or that steps can be taken to address problems that are encountered.

In this context, where libraries have primary responsibility to their communities for ensuring the reliability of digitized items they make available, the question of retaining versions of items, and broad questions of reliability in general, become questions that depend on the needs and resources of the social system. The question in this case becomes not whether to retain multiple versions of items, but how to best meet community needs for preservation, including reliability and authenticity, in ways that are sustainable and responsibly manage community resources. Recording the provenance of digitized items is crucially important, but does not in and of itself speak to issues of reliability, and can be completely separate if a digitized item has quality problems and is not able to stand as a faithful copy of the original it is intended to represent. Issues of reliability, particularly in relation to information quality and in light of community needs, are a current area of study for the partnership.¹⁶

5.2.5 Context

Content in the Task Force report refers to “the ways in which [digital information objects] interact with elements in the wider digital environment” (1996, 18). The report points to three dimensions of context that have to do with technical aspects (hardware and software dependencies), linkages among digital objects (to the degree to which the integrity of an object lies in the network of linkages), and communication medium (the extent to which the way materials are distributed—for instance, bandwidth or security constraints or attributes—account for characteristics of the digital objects) (1996, 18-19).¹⁷ The

¹⁵ HathiTrust’s Digital Preservation Policy notes that “HathiTrust is committed to preserving the intellectual content and in many cases the exact appearance of materials that have been digitized for deposit.” This includes “Digital representations (images) of content as the content appeared in its original form, with the same layout and colour (e.g., for illustrations and artwork), and in the same order.” (HathiTrust n.d.g).

¹⁶ See, for example, the work of Paul Conway (Conway 2011). HathiTrust’s policy on quality is available at <http://www.hathitrust.org/quality>.

¹⁷ With regard to communication medium, the report gives the example of increasing bandwidth resulting in the production and distribution of high-bandwidth products such as “full-motion video.”

report points also to a broader social environment and the contextual role that policies and implementation details regarding bandwidth, security, and other network qualities can have on information integrity.

HathiTrust's use of open formats and practice of transforming master images for access in different contexts address many of these contextual concerns about information integrity (the integrity of objects in HathiTrust does not depend on hardware or software, and due to the flexibility of formats, access considerations are separate to some degree from preservation concerns). HathiTrust objects exist entirely within the repository, so the issue of linkages as it is relayed does not apply. There are some significant elements of context in HathiTrust, however, that are relevant beyond the explicitly digital environment in which they exist. The first of these is the relation of objects in HathiTrust to their print counterparts, and the second has to do with discovery and use.

Relation to Print. HathiTrust's fourth stated goal is "To stimulate redoubled efforts to coordinate shared storage strategies among libraries, thus reducing long-term capital and operating costs of libraries associated with the storage and care of print collections." Understanding the relation of the digital objects in HathiTrust to the print items owned by libraries (whether the item in HathiTrust was digitized by their library or not) has had profound implications for the development of HathiTrust. HathiTrust began with a pricing model based on a per-gigabyte fee, covering the infrastructure costs of the content institutions deposited. As HathiTrust has grown (from 2.5 million volumes when it was launched to nearly 10.5 million today), the overlap with North American academic and research libraries has become so significant—likely more than 50% on average with Association of Research Library libraries¹⁸—that it has shifted from being a strategy for institutions to preserve their digital volumes, to being a strategy to preserve their print volumes as well (with digital "backups").

In recognition of this fact, HathiTrust developed a pricing model, which will be in effect in 2013, that is based on the overlap of partnering institutions' print holdings with the digital holdings in HathiTrust. The pricing model is supported by a holdings database (represented in the Data Management component in Figure 1) that maps institutional print holdings to holdings in HathiTrust. This holdings database represents a new contextualization of the digital objects, and the physical objects as well, in a broader information environment. In addition to helping libraries to understand the relationships between their collections of print and digital objects, the holdings database will support the expansion of lawful uses of in-copyright materials in HathiTrust that are owned in print by the partnering libraries.¹⁹ Contextualizing the holdings of HathiTrust revolutionizes the way libraries conceive of their collections and provides a basis for a "deep infrastructure" on which libraries can collaboratively move their content and services into the future.

Discovery and Use. HathiTrust offers centralized access services, including bibliographic and full-text search, as well as reading, downloading, and collection-building capabilities. In addition to these services, and in support of the last of its stated goals related to a centralized yet open technical framework, HathiTrust offers several APIs and data feeds that allow partner and non-partner institutions to contextualize their own collections in relation to HathiTrust. For instance, partners can use information from HathiTrust APIs to add links or entire records for HathiTrust items to local discovery mechanisms.²⁰

¹⁸ This figure is extrapolated based on analysis of trends observed in (Malpas 2011) and HathiTrust repository growth since that time.

¹⁹ A description of the specific uses and circumstances of access to in-copyright works that HathiTrust has targeted is given at http://www.hathitrust.org/authors_guild_lawsuit_information#Details.

²⁰ Information on how this can be done is available at (HathiTrust, n.d.h).

The collection-building capability allows users to create and reference canonical bibliographies of materials such as the English Short Title Catalog, and other sets of materials.²¹

In each of these ways, by contextualizing HathiTrust materials in their broader environment, and allowing others to contextualize local collections, HathiTrust creates pathways for meaningful connections between collections and items to be made. This simultaneously improves discovery and use of materials, and uncovers new opportunities for libraries and cultural heritage institutions to engage in collective action to address shared challenges.

6. Conclusion

This paper has highlighted the ways that HathiTrust's understanding of preservation as a social and collaborative activity has influenced specific approaches it has taken to preserving digital information—both in its technical infrastructure, and in relation to issues of content formats, fixity, reference, provenance, and context. By focusing on community needs and social factors in concert with technical considerations, HathiTrust has been able to gain a broad base of support for its activities, and take decisions that strengthen its ability to meet community needs over the long-term. In the end, it is we, collaboratively, who have responsibility for moving our collections into the future, and strategies that bring our efforts closer in concert with one another are the most likely to succeed.

Acknowledgements

This paper has only been possible through deep consultation and collaboration over a period of years with staff at the University of Michigan Library that designed and built HathiTrust's repository infrastructure, and staff at numerous institutions as the partnership has grown. I would like to extend special thanks to Cory Snavely, Aaron Elkiss and Sebastien Korner for their input and clarification of repository processes, and John Wilkin for reviewing and commenting on the paper.

"Archiving-as-a-Service"

Influence of Cloud Computing on the Archival Theory and Practice

Hrvoje Stančić,¹ Arian Rajh² and Ivor Milošević³

¹University of Zagreb, Croatia, hrvoje.stancic@zg.t-com.hr; ²Croatian Agency for Medicinal Products and Medical Devices, arian.rajh@halmed.hr; ³University of Zagreb, Croatia, ivor@srce.hr

Abstract

The research is positioned in the context of the responsibility of archives to preserve important records in an increasingly changing technological environment, and focused on the impact of cloud solutions on archival theory and practice. Authors address several questions which they consider crucial for archival science and community. Results of the survey on the usage of private cloud are given. In view of that, the authors examine if the concept "Archiving-as-a-Service" will require redefinition of archival practice in the new technological and organizational context. Finally, they suggest the need for transition from postcustodial to "postcustodial 2.0" paradigm.

Authors

Dr. Hrvoje Stančić, associate professor, is Head of the Chair for archival and documentation science at the Department of Information and Communication Sciences, Faculty of Humanities and Social Sciences, University of Zagreb, Croatia with national and international teaching involvement. He is author of the book 'Digitization' and more than 50 scientific papers. His research is focused on digitization and long-term digital preservation issues. He co-coordinated activities of DigitalPreservationEurope initiative at the Faculty level. He was researcher at several national and European research projects and was the leader for national component of the EU 'Heritage Live' cross-border research project.

Dr. Arian Rajh, assistant professor, works as Head of document, records and project management department in Croatian Agency for Medicinal Products and Medical Devices. He is also a member of European Telematic Implementation Group on Electronic Submission, chairperson of Ad-hoc drafting guidance subgroup 'Best archiving practice' and external associate at Faculty of Humanities and Social Sciences, University of Zagreb, Croatia. He graduated in Information sciences and Comparative literature in 2005 and received his Ph.D. in archival science in 2010. Rewards/scholarships: City of Zagreb scholarship (2004), Rectorial award (2004), "Franjo Marković" (2005), DigitalPreservationEurope Exchange Programme Award (2008).

Ivor Milošević, is a Ph.D. student at the Doctoral study of Information and Communication Sciences at the Department of Information and Communication Sciences, Faculty of Humanities and Social Sciences, University of Zagreb, Croatia. He works at the University Computing Center where he is responsible for implementation of virtualization services.

1. Introduction

Paradigm is the leading form of a specific science and its institutional position and practice in a certain period, where explicit ideas became dominant theoretical framework. Other theories come to be included in the newly-born paradigm. Then the paradigm-creation period is followed by formation of "normal science" and its practice which influences various institutional practices. However, and this is not in line with Kuhn's model of development of natural and technical sciences, paradigms in humanities and social

sciences can be seen as marketplaces of ideas or islands of coexistence of similar ideas.¹ Drastic cuts of paradigms are less often noticed in models of development of humanities and social sciences, theories pertaining to these domains can be cumulative and knowledge can be built on previously known knowledge—if the differences are not radical. Differences between paradigms in archival science are more distinct than in social sciences in general, but they do not have all characteristics of scientific revolution model. Paradigms in archival science that can be noticed, at least in its scientific period, can be described as codification of archival science (Dutch archivists and Jenkinson), modern archival science (Schellenberg and followers) and postmodernism or, as John Ridener² stated, the “questioning” paradigm. Principle and observation of changing paradigms can be applied also to archival institutions and their activities and interactions with the creators, and good example of that is the difference between custodial and post-custodial archives. Notion of post-custody, from Gerald Ham onwards, from distributed custody methods to broader connotation of the term that includes new functions of archival institutions and services are related to the latest archival paradigm.

Criteria for identification of a possible new archival paradigm is the difference between the basic theoretical framework (with which we can tie the largest number of archival theories in certain period, theories that significantly affect the practice and methodology, like, for example, emergence of other forms of archival description) and its practical results. Development of archival science is not fully in accordance with the scientific revolution model, as it could be expected, since archival science pertains to social sciences. Thus, the phenomenon of accumulation of knowledge, together with its reinterpretation and reuse can be detected. However, professionally recognized body of theories grouped under the same paradigmatic umbrella is different comparing to the previously known theories. There are paradigmatic differences in basic definitions, like definitions of archives, the role and importance of professionals in the archives, and their basic methodological principles. Postmodern archival theorists raised Derridian question of what is external to archive but organizes its practice. Today’s question is similar—we may ask ourselves what is external to archive but aims to influence its practice. This is the reason to start reflecting on today’s and future services that can support archival functions. That is why the notion of archiving and cloud computing should be seen in the light of the latest paradigm, even as its contemporary enhancement like “post-custody 2.0” or similar.

Records continuum model places the object of archival preservation in a specific temporal and spatial relationships of the primary and any other institutional, business, or social context in order to describe broader preservation responsibilities. Can cloud services and archiving organized as cloud services be considered as means of fulfilling those responsibilities? Can they be “mapped” to dimensions and axis of the records continuum model? Cloud services can support organization needs of creators and institutions with limited and uncertain IT resources and thus they can facilitate better availability of records and archives to the future users, assuming good management of the service. Cloud service can also support recordkeeping function of different but linked creators, group their archives, document their wider purpose, and facilitate creation of collective memory. Today’s archival experts are active members of the information community so they should actively think about new storage and (potential) archiving possibilities and plan their responses to the challenges. And challenges are approaching quickly due to the quick technological development. We are witnessing constant technological change and since now, with

¹ Thomas S. Kuhn, *The Structure of Scientific Revolutions*, 3rd ed. (Chicago: University of Chicago Press, 1996).

² John Ridener, *From Polders to Postmodernism: A Concise History of Archival Theory* (Duluth, MN.: Litwin Books, 2009).

the proliferation of cloud services, the postcustodial practice did not have a great challenge. However, it seems that the archival science will have to approach the archiving in the cloud issue.

2. Digital Preservation Environment

“With the current global economy facing financial pressure, organizations are compelled to reduce operational costs and streamline their efficiency. Responding to this imperative, it is estimated that more than 20 percent of organizations have already begun to selectively store their customer-sensitive data in a hybrid architecture that is a combined deployment of their on-premises solution with a private and/or public cloud provider in 2011. (...) At year-end 2016, more than 50 percent of Global 1,000 companies will have stored customer-sensitive data in the public cloud.”³ This Gartner’s prediction is showing a trend of business change towards the cloud-based storage. Since there are several approaches to provision of cloud services and organization of cloud storage it is necessary to distinguish between them in order to better understand their functionalities. This will help better understanding of necessity and possibilities of archival intervention.

The cloud computing paradigm (which can be regarded as part of the questioning paradigm or as “post-custody 2.0” in the context of archives and archival science) includes a spectrum of many models, developers and reference designs as well as several essential characteristics, as mandated by the National Institute for Standards and Technology, which include: on-demand self-service, broad network access, resource pooling, rapid elasticity and measured service.⁴

In the standard classification of cloud infrastructures one differentiates between several deployment models with subsequent service models as follows:

- *Software as a Service (SaaS)*: ability to deliver applications from cloud-based physical infrastructure, accessible via various client software tools or devices. The user has no awareness or control of the underlying physical components or software configuration capabilities outside the delivered application.
- *Platform as a Service (PaaS)*: ability to deliver complete environments (operating systems and required tools) for testing or development of external applications. The user, however, has no control over the configuration settings of the application-hosting environment.
- *Infrastructure as a Service (IaaS)*: ability to deliver complete virtual datacenters to the user who is then able to configure and deploy virtual machines and other relevant/corresponding virtual components according to their personalized requirements.

According to the deployment models cloud implementations include:

- *Private cloud*: where it is implied that the cloud infrastructure is built and provisioned for private use by a single organization. Private clouds in practice tend to be service-oriented with specific roles and requirements.

³ “Gartner Reveals Top Predictions for IT Organizations and Users for 2012 and Beyond,” Gartner, December 1, 2011, <http://www.gartner.com/it/page.jsp?id=1862714>.

⁴ The NIST Cloud Computing Project. Accessed August 8, 2012, <http://csrc.nist.gov/nice/states/maryland/posters/cloud-computing.pdf>.

- *Community cloud*: where the physical infrastructure is implemented, administered, and operated by several organizations in a certain community of consumers from organizations that have shared goals and requirements.
- *Public cloud*: the cloud infrastructure is intended for “rent” by the public users, as delegated by the provider usually for profit or other means of compensation for the provider.
- *Hybrid cloud*: the combination of two or more physical cloud infrastructures from different branches of the above listed deployment models that are physically separate but are connected via the means of mutual data and application portability or management hierarchies.

Most initial, real world private cloud implementations tend to focus on either SaaS or IaaS methodology and features, or the combination of those two, since the role of PaaS is limited to a very specific set of users, mainly in software development where they deliver computing platform or a solution stack as a service, often consuming cloud infrastructure and sustaining cloud applications.

To adequately address increasing examples where combinations of these concepts are merged on both the physical and logical level in order to create a specific service (such as the proposed Archiving as a Service model) it is possible to resort to a form of reclassification of the standard paradigms and definitions in the cloud computing service environment, where these combinations are described and are given adequate alternate labels depending on the specific service they are ultimately intended to offer.

On the other hand, since most contemporary installations and implementations of both private and public cloud infrastructures resort to various underlying hardware technologies, software solutions as well as logical models, in order to create the all-encompassing concept of XaaS or “Everything as a service,” within which all other services and usage models can be compartmentalized, one can view the attempt to adequately describe archival service and digital preservation as a method of selecting required components and features within this base umbrella model.

It is possible to explain and define the concept of cloud computing as an additional security layer superimposed on virtualization technologies, allowing users a degree of self service and disassociating the underlying physical components from the end-user experience. So in the context of “digital preservation as a (cloud) service,” the cloud infrastructure would provide all the components which can be utilized towards the goal of enabling successful and efficient preservation of digital data.

Virtualization allows high availability schemes as well as safety mechanisms from data corruption due to hardware malfunction to be implemented. “The key here is replication of the storage system so that, in an emergency situation, the remote location can independently take over all the operating components of the primary.”⁵

It is certainly impossible to separate digital preservation solutions and particular technology completely, but the key for successful preservation is in using and switching to available technologies. The principle was put out in OAIS RM⁶ concept and standard—to observe technological environment and

act proactively, to enable replacement of components and concepts (that is why OAIS is a reference model, implementation is always based on selected technologies). Technological environments and solutions on the market should be seen as currently available tools and the archival experts' assignment would be to estimate what are the best tools at the moment that can be used in and for creators' recordkeeping programs. In this way, archival experts should assess the value and risks of archiving in the cloud environment and act according to their professional evaluation.

3. Transition to Cloud Services

In order to better understand the tendency of transition to cloud services one should consider their possible advantages over the earlier, i.e., still the most dominant, information infrastructure organization like server consolidation. Putting aside the advantages of availability of data from any place with an internet connection or availability through mobile or tablet clients, cloud services could offer (semi)automatization of digital preservation functionalities. For example, cloud services based on storage of creators' content could offer, for a start, some analytical functionality that can run through the content and provide information on formats and versions of the stored data in order to provide possible adequate reaction in time. If potentially obsolete file formats are found service provider could alert its clients that their content could become unusable. This analytical tool could enable the provider to offer additional service. This second step could be, for example, automated conversion of client's content into higher or more stable formats, migration to advanced media (when necessary), emulation (if necessary) and re-authentication or validation of authenticity of the content.⁷ That means that the cloud solution could (semi)auto regulate itself against obsolescence of its contents. These mechanisms could be tested and implemented and become parts of cloud services' best practices. Of course, the same approach could be implemented on the local storage, but having a service, in some cases outsourced, with fully implemented preservation mechanisms could be the reason to choose one cloud service provider over another.

It would be misleading to expect that creators insist on using just standardized formats for their content. On the contrary, they are usually creating, receiving and working with various and non-standardized (or not preservation-appropriate) types of content. Creators do not always possess specific knowledge of maintaining the content, and that is one of the reasons for paying external service. Entity of origin is not always able to ensure quality and sustainability of the content. Additionally, archival institutions that are monitoring some of creators, namely creators from the state, regional and public spheres, have little or no control over dislocated contents stored in the cloud services. If the creators delegate custody of their content to the providers and archival institutions have limited or indirect influence on preservation processes that take place in the cloud, it would be a step back from the already achieved level of custody. Archival community should recognize that expanding horizons of service providers is very important for preservation processes today. Archival community is required to be a key factor in preservation, to transfer methodology and to ensure maintenance of the preserved content. The

Lisette van Gemert-Pijne, Hans C. Ossebaard, Åsa Smedberg, Sincalir Wynchank, and Piero Giacomelli (IARIA, 2012), 105-110; Hrvoje Stančić, Arian Rajh, and Krešimir Pavlina, "Long-term Preservation Solution for Complex Digital Objects Preserved as Archival Information Packages in the Domain of Pharmaceutical Records," in *eTELEMED – The Third International Conference on eHealth, Telemedicine, and Social Medicine*, ed. Lisette van Gemert-Pijnen, Hans C. Ossebaard, and Päivi Hämäläinen (IARIA, 2011), 13-21.

key actor in this case is not entity of origin itself, but the provider of preservation service. It would be easier to deploy adequate preservation services by influencing providers of services through their best practices and guidance documents then by influencing content creators themselves.

4. Research

Archival institutions shifted from custodial acquisition model, due to hyper production of (electronic) records, requirements which were necessary to meet to ensure the readability of files, and capacities of archival institutions' repositories, to post-custodial activities like supervision and consultation of categorized records creators and to commercial services like providing archival arrangement to creators. Categorized creators of public records, with the guidance of archival institutions, started to function as archives for their specialized archival holdings and data assets, but hyper production and infrastructure problem inevitably reached them too. Although storage becomes affordable, recordkeeping services and procedures within repositories become more specialized and more complicated for records creators. Bluin Jr. and Rosenberg described processes of enriching connotation of records from purely transactional (evidence of transactions and vested rights) to social and political, when they become accumulated in repositories of archival institutions.⁸ This is basically the goal of archiving. Preservation of records implies preservation of records and their organizational, business and wider social context. With prerogative of long-term preservation (LTP) of records, as long as they have to exist for legal and business reasons, according to records continuum model, and with difficulties in protecting and preserving authenticity of complex electronic objects, creators are more and more interested in outsourced archival services which can support protection and long-term preservation of their electronic archival holdings. Therefore, postcustody or delegation of custodial function has reached the next step.

Basic requirement that provider of archiving service in cloud environment have to meet is to ensure the confidence of internal and external users in entity of origin and its archival holding. That means that provided service is safe and stable. Provider of services should follow all professional and technical regulations and plans or at least enable long-term preservation practice over entrusted digital objects. Objects intended for long-term preservation should remain accessible by usage of methods such as migration, typed object conversion or other digital preservation methods systematized by Thibodeau,⁹ ideally performed within provided service. Provider of archiving service should be aware that the service is not reduced to providing mere repository for storing digital documents. Service should encompass proactive archival management of (complex) digital objects, their organizational context and provenance. It should guarantee continued usage of archived objects as authentic and trusted sources of evidence for creator and information for present and potential wider user community. Link between this basic requirement (of safe and stable environment that provides confidence in creator and its archival holding) and additional requirements is scalability and long-term preservation proactiveness of service. Most creators have legal or business need for preserving authentic digital objects as resources or results of their business processes, but no professional or technical knowledge how to perform these tasks in the long-term perspective. Although creators are rarely interested in renting just

⁹ Kenneth Thibodeau, "Overview of Technological Approaches to Digital Preservation and Challenges in Coming Years," in *The State of Digital Preservation: An International Perspective* (Washington, D.C.: Council on Library and Information Resources, July 2002), 4-31. Accessed June 4 2012, <http://www.clir.org/pubs/reports/pub107/pub107.pdf>.

storage space, some creators have very strict requests related to care for authenticity and probative value of their information holdings and they require additional LTP mechanisms and services.

Providers of such services should offer response to creators' current needs, offer more than just dislocated storage, and become successful players in this new market. In order to provide adequate services they should satisfy requirements like high availability of cloud services, security mechanisms, protection of holdings and data assets like backup and recovery procedures, protection of records and data, contextual links with creators, protection of records and data authenticity, long-term preservation mechanisms, readability protection mechanisms, availability and restrictions mechanisms, distribution mechanisms, financing and insurance models that support long-term preservation etc.

5. Survey Results

The need for enumerated requirements has motivated us to conduct a survey in order to examine what is included in already available cloud services for (archival?) storage on the market today. The results that follow are showing the present state of affairs in private cloud infrastructure among the seven survey respondents: from a global corporation with offices in 58 countries (1), USA (1), Great Britain (1), Slovenia (1), Croatia (2 + 1 local branch of an international corporation).

As is to be expected, most answers fall into the "very familiar" category (see Figure 1) since all of the surveyed companies have "in production" implementations of private clouds as well as technical staff with the expertise needed to maintain and operate such systems.

The purpose of the private cloud is implicitly versatile, although it is apparent that the focus is either on supporting internal company operations or hosting external services rather than both (see Figure 2). The main reason for that lies in the fact that an implementation that would satisfy both types of users would create various access, security and maintenance issues.

It is obvious that hosting internal services, server consolidation and similar operational purposes are the mainstay of a private cloud infrastructure, however its extreme flexibility allows for adaptation to practically any purpose even when dealing with sensitive data. Data stored on the cloud include

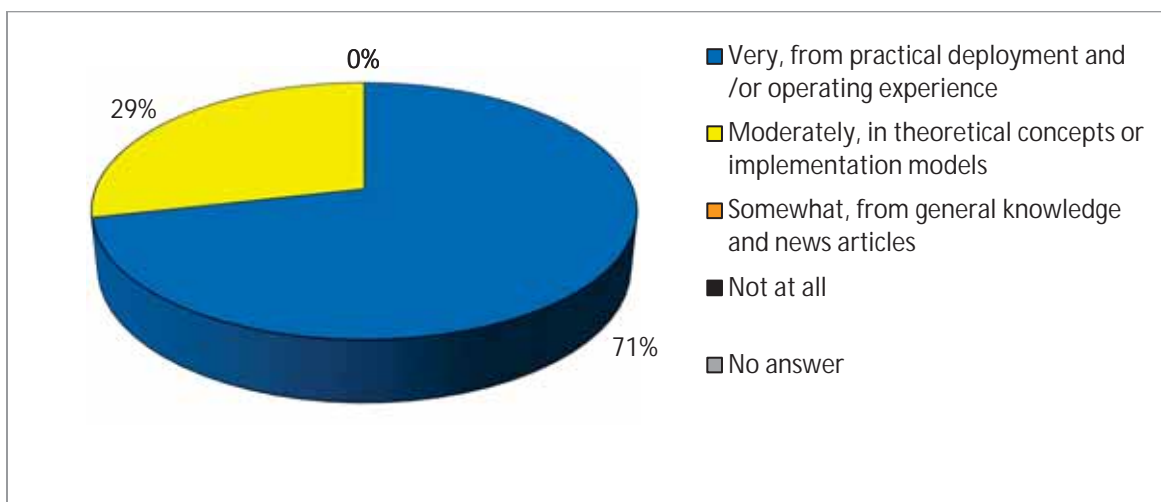

Figure 1. How familiar are you with the concept and/or technology implementation of private clouds?

Figure 2. What is the primary purpose of your existing private cloud infrastructure?

information, for example, about employees with their personal data taken for HR purposes (see Figure 3). This shows confidence in security and authenticity mechanisms of the cloud infrastructure which is on par with more traditional IT infrastructure implementations.

In the “Other” category respondents indicated the usage of digital certificates and built-in access controls in a content management system. The comment: “We are not posting confidential information, such as contact information (...), online even with access restrictions” shows that the users are still careful in trusting cloud solutions. Nevertheless, it is obvious that customers and service providers are investing a lot of effort in data security in private cloud implementations since many of the proposed methods for data protection and access control are implemented in a majority of surveyed companies (see Figure 4).

Enterprise level cloud-based solutions for state or image backup are becoming increasingly reliable and have reached a maturity state where they are gaining ground to the more traditional OS-based backup solutions (see Figure 5). With their inclusion into standard enterprise license offerings these solutions provide rapid disaster recovery as well as file level and incremental backups, therefore becoming an all-encompassing recovery tool especially useful in private cloud implementations.

Some of the more advanced features of virtualization clusters and cloud infrastructures (such as HA, or DRS systems¹⁰) are obviously one of the main attractors to implementing services in the cloud

¹⁰ HA - High Availability - provides cost effective, automated restart within minutes for all applications in the event of hardware or operating system failures (<http://www.vmware.com/solutions/datacenter/business-continuity/high-availability.html>); DRS - Distributed Resource Scheduling - continuously monitors utilization across a resource pool

Figure 3. Does your private cloud implementation deal with sensitive data or copyrighted materials?

Figure 4. What methods for data protection and access control are you currently utilizing?

since many of them are readily available for installation with the selected virtualization software. It is not unusual that most of the interviewed companies have chosen to implement them in their private clouds. Some of the more costly ones requiring offsite or redundant datacenters are logically the “luxury” of financially more capable institutions while on the other end of the same scale, in the “Other” category, one respondent indicated usage of “backup stored on-site on labeled DVDs, with a README file on

and intelligently allocates available resources among virtual machines according to business needs (VMware vSphere, URL: <http://www.vmware.com/products/drs/overview.html>). Accessed August 8, 2012.

Figure 5. What type of backup technologies are you using within your private cloud?

installing the backup on a server.” The results show diversity of used approaches but still the trend towards the more advanced solutions can be clearly seen (see Figure 6).

The big issues with cloud implementations are security and usage policies. Although most replies state that there is some form of official policy in place, less than half represent a fully structured document with all the necessary specifications outlined in the appropriate manner (see Figure 7).

Recordkeeping implies written policies with implementation monitoring. ISO15489 recordkeeping standard puts more emphasis on policy making and documenting than on building technical part of the system itself. It also states that recordkeeping policies should be endorsed on managerial level and promulgated throughout the organization. That means that users, the key ones as well as the regular ones, should become familiar with recordkeeping policies and the answers from the survey show that the majority of employees are not familiar with them.

A great benefit of owning a private cloud is the implicit versatility. Respondents, for example, indicated their intention to implement an intranet in the cloud as well as a digital library (see Figure 8). Overall, the survey answers here show that although server consolidation is still the primary and most widespread way of information infrastructure organization, a private cloud is being utilized as well. However, depending on specific interests, all other areas of information infrastructure are included too.

Concerns regarding private clouds vary greatly according to specific institution needs and requirements (see Figure 9). Standardized or out-of-the box solutions rarely cover all concerns and com-

Figure 6. Do you currently have any of the following disaster recovery, accessibility technologies for your private cloud?

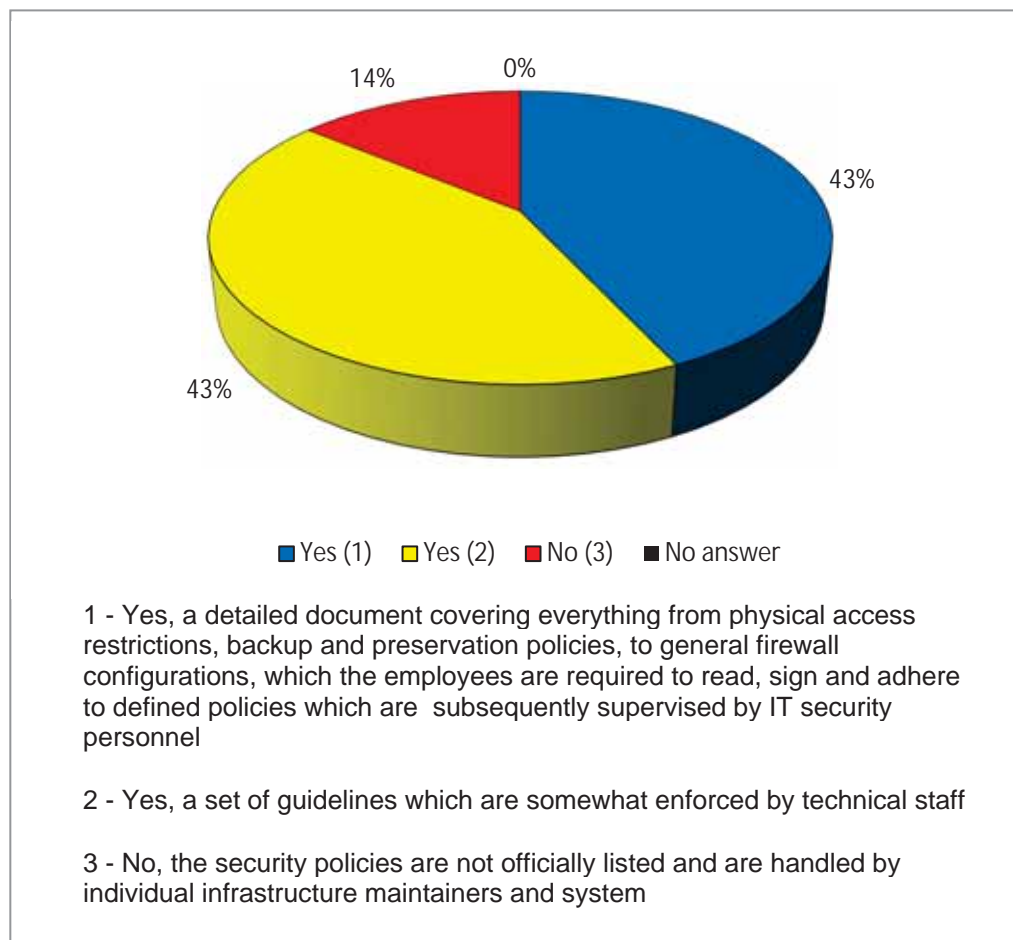

Figure 7. Do you currently have any type of security policy regulating infrastructure usage, access, password policies or long-term preservation of data?

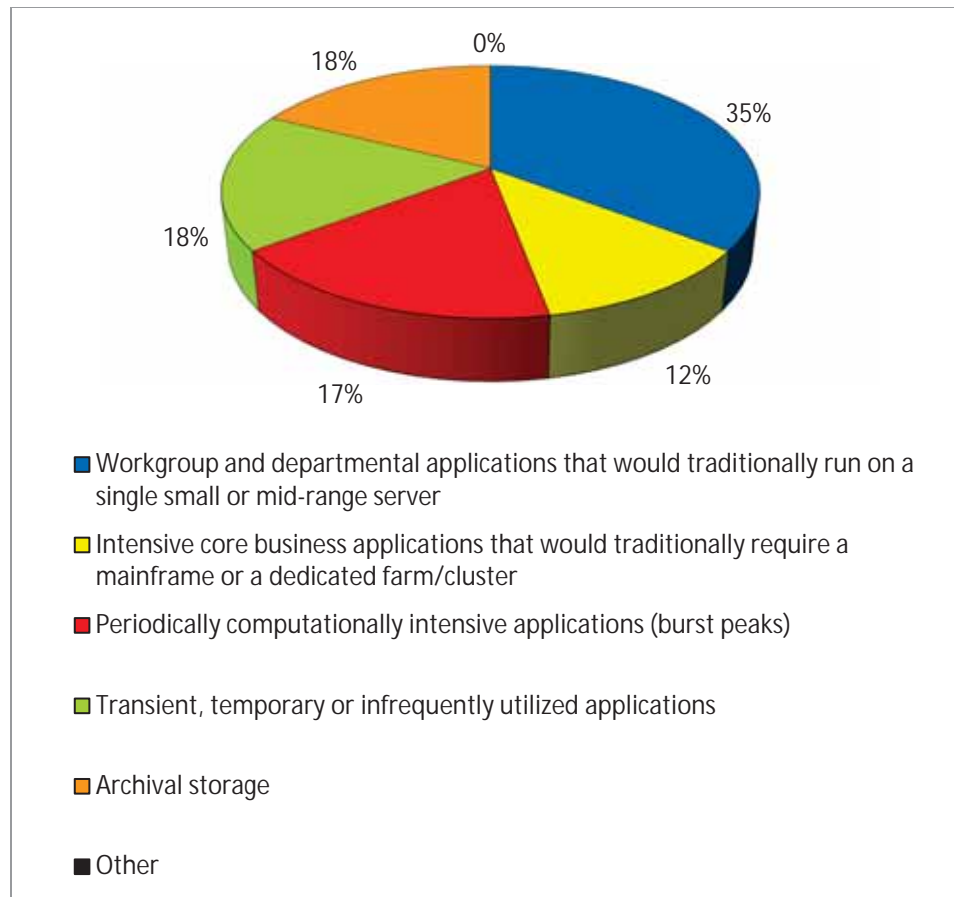

Figure 8. Do you plan to use or presently use your private cloud infrastructure for the following purposes?

Figure 9. Would you agree with these frequently listed concerns about private cloud?

panies are often required to draw on internal technical staff in order to customize one or several solutions to their liking. Therefore private cloud implementers are still weary of the features, workload, skill and applicability problems with such technologies—analogous to their internal staff, operation procedures, technology capabilities and reliability. One respondent bluntly commented the concern for shortage of necessary skills: “There is not available talent to do something in-house which multiple staff can understand and maintain.” Lack of relevant industry and other standards is still a big issue and this gap could be filled by issuing best practices that could be followed by more and more providers in order to enhance cloud services and implementations.

The results show that cloud solutions are dominantly used for shared storage space and storage of specific type of content (see Figure 10). This means that the cloud is still not used as a full grown business solution but as expansion and/or upgrade of the needed services for certain types of content. From this it can be concluded that storage and archiving in cloud environments are upcoming services. This is issue that should be covered by archival professionals and their contributions could be included in best practice documents. Their skills in the fields of organization, indexing, classification and registration, as well as their preservation related knowledge and experiences, should be added and used in the design phases, i.e., before implementation of cloud environment itself.

Figure 10. Does your private cloud host any type of data repository / archival storage service?

Interestingly, as shown in Figure 11, all surveyed institutions have one or more mechanisms for ensuring data authenticity or integrity implemented, and no institution is using any mechanism other than those listed in the survey. Under “Versioning” the usage of “audit trail with rollback” was indicated and “lots of provenance information” under “Metadata” category. This shows that users recognize the importance of content authentication and addition of metadata in order to provide long-term preservation and interpretability of content. The goal should be to preserve authentic content which could be used for evidence and wider-interpretable purposes. Carefully designed metadata is the key for long-term preservation. It is recommended that metadata are selected according to the relevant metadata standards and adjusted to the specific content. This is also the issue that should be addressed by the archival experts.

Both static and dynamic content were represented in the respondents' answers (see Figure 12). Static content, like documents usually created by word processors and office applications, is easier to preserve over the long-term while multimedia and dynamic interactive content require special methods of accumulation, organization and preservation.¹¹

Figure 11. What types of mechanisms are used in order to ensure data authenticity/integrity?

Figure 12. What type of content do you support with your service?

¹¹ For additional information on types of content see Martine Cardin, "Part Two—Records Creation and Maintenance: Domain 1 Task Force Report," [electronic version] in *International Research on Permanent Authentic Records in Electronic Systems (InterPARES) 2: Experiential, Interactive and Dynamic Records*, ed. Luciana Duranti and Randy Preston (Padova, Italy: Associazione Nazionale Archivistica Italiana, 2008), 9. http://www.interpares.org/ip2/display_file.cfm?doc=ip2_book_part_2_domain1_task_force.pdf.

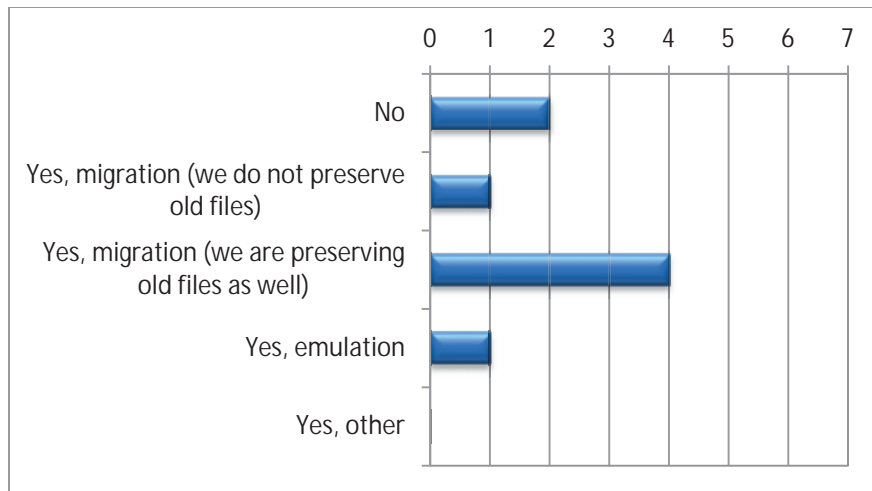

Figure 13. Do you offer one of the long-term preservation mechanisms as part of the service provided?

Although long-term preservation is indirectly very compatible with private cloud implicit technologies, it is in the process of being introduced as a cloud-based service. Some of the more explicitly applicable technologies are already being used for this purpose, while others are still being explored as alternatives or additional components of the cloud-based long-term preservation mechanisms. The results show that the importance of preservation planning is recognized among users and providers as well (see Figure 13).

Since cloud technologies imply indefinite scalability, all the surveyed companies recognized this and did not set or predefine a limit to the storage capacity which is to be allocated to their private cloud users (see Figure 14). This is how the cloud technologies should be implemented if financial and other considerations can be met.

As “Other” it was indicated that either the respondents do not charge for the service (3) or that there is a “fair use” limit for processing and a charge if exceeded (1) (Figure 15).

When asked to leave a comment on the survey one respondent indicated: “The two absolute best things for library repositories would be: 1) Awareness in the library community of the value of interoperable metadata, and 2) Easy to implement (i.e., built into content management systems) tools for using checksums to monitor for bit rot.” This comment from the users’ perspective excellently shows that the cloud service providers should cooperate more with the designated communities and experts in the field of archival science in order to be able to offer services tuned up to the specific archival needs and requirements, i.e., quality, preservation-aware services.

6. Discussion

The concept of archiving in the cloud environment or, as it could be called, “archiving-as-a-service (AaaS)” expands the definition of postcustodial archival practice in the new technological and organizational context. This could be seen as transition to the next stage of postcustodial archival practice. The notion of post-custody presumes that a creator is responsible for its own records and that archival institution supervises the creator. What could happen with the notions of responsibility and control during this technological shift? Who should perform supervisory activities, to what level do they extend and who

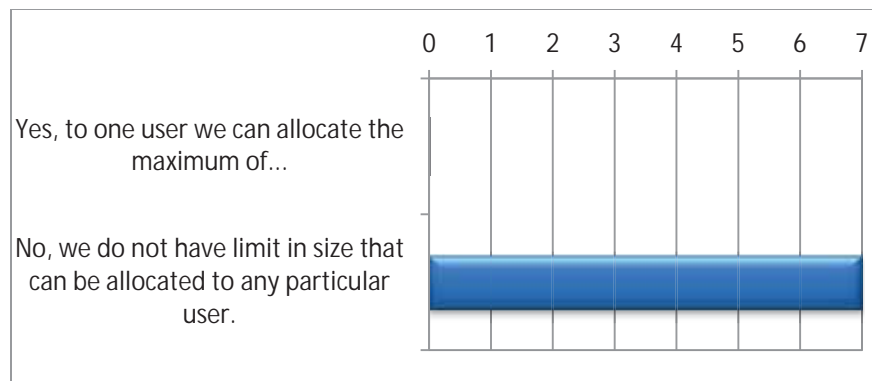

Figure 14. Is there any limit in the size (GB, TB ...) of the cloud storage that can be allocated to any particular user?

should be subjected to supervision? In the case of archiving in the cloud environment, where archiving practice is taken by service providers, several scenarios could occur:

1. Service providers are responsible for control of archived content without much interference and additional control taken by creators and archival institutions;
2. Creators invest much effort in additional control of non-standardized services;
3. Services are standardized through best practices and creators recognize the importance of choosing providers consistent to these practices;
3. Archival community is actively involved in the new concept of archiving and influence providers' practices.

The last scenario is probably the best way to ensure long-term protection, preservation and usage of electronic content created and archived today. This also implies updating of the concept of custody (see Figure 16). Characteristics of this new “postcustodial 2.0” stage would be comparable to positive shift in the public institutions' records management in the first half of 20th century when previously codified methodology entered into practice and made public records usable outside boundaries of their primary context.

7. Conclusions and Future Work

Custodial archivists from archival institutions had carried out custodial tasks on behalf of creators. Postcustodial archive monitored creators during creators' custodial activities. Today, custody is outsourced and archival community should direct its postcustodial advisory (if not supervisory) efforts to the new providers of custody. Therefore, it becomes much harder for the archival institutions to monitor and influence archival procedures. With the switch to the cloud services the records creating and preserving practice starts to elude the postcustodial influence of the archival institutions since it became technologically more difficult to achieve the sufficient level of supervision either over the quality of the services in the Archiving-as-a-Service (AaaS) approach or over the fully blown cloud service in which the records are both created and archived. Therefore, the archival community should persuade various recordkeeping service providers to prevent content obsolescence by adding additional functionalities such

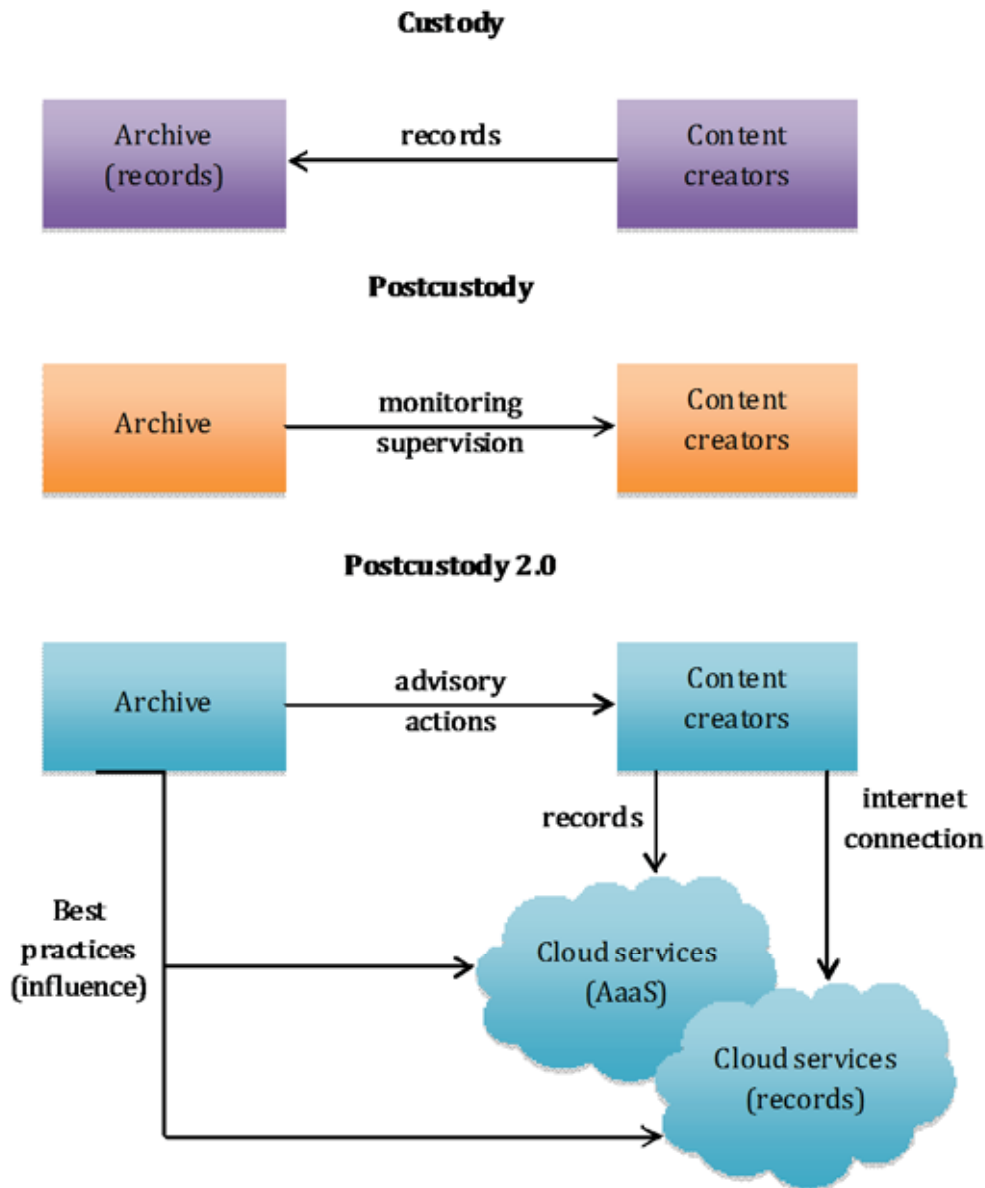

Figure 16. Changes of archival practice.

as content analyses and preparation for migrations and/or emulations. Wider approach could be an active involvement in production of best practice documents (and standards in time) for cloud implementations. Archival community should recognize the cloud computing discourse and contribute as well as add archival notions and terms to crucial zones of the new discourse. A good way to get archival notions implemented is through cooperation with experts in cloud computing and provision of cloud services, and through their best practices (in lack of standards for this particular area). The goal of archival community, and that is safe and secure long-term preservation of authentic, reliable and reusable content, should also be the target for providers of cloud services who want to rise above the competition and offer a better level of service. The archival community should therefore act proactively and impose itself as a key factor in the formation of the new, preservation-aware cloud services.

Planned future research and actions consist of detection of further trends in providing cloud services with implemented archival requirements as discussed in this paper. Also, the plan is to raise awareness both within archival community for the need to require archival level of cloud services as well as within cloud service providers for the need to implement the appropriate mechanisms. It is planned to include this problematic in the graduate level curriculum of the Study of archival science at the Faculty of Humanities and Social Sciences, University of Zagreb.

The CODATA Mission:
Preserving Scientific Data for the Future

Recovering the Forgettery of the World

Elizabeth Griffin and the CODATA DARTG Team

Dominion Astrophysical Observatory, Victoria, Canada

Abstract

This Session of the conference examines an aspect of scientific data from a somewhat unusual perspective, by focusing on observations that are not, or not obviously, a formal part of the memory of the World. Almost exclusively those data are historic records; they complement modern ones in a way that can be crucial for accurate studies of long-term trends. A CODATA Task Group, “Data-At-Risk”, is creating an Inventory of such data that catalogues their locations, types and volumes, and risk levels, as a prerequisite for designing efficient programmes to rescue the scientific information that they contain. The rationale for the CODATA effort is rooted in the knowledge that heritage data can offer unique evidence for solving some of the most pressing scientific unknowns that the world is currently facing. This Introduction examines that rationale, and the presentations that follow illustrate different types of data that are currently being rescued and brought into the public domain.

Author

Dr. Elizabeth Griffin is a volunteer researcher at the Dominion Astrophysical Observatory in Victoria (Canada). Since her Ph.D. at Cambridge (UK) in 1966 she has researched astrophysics at Cambridge, Oxford, Antwerp, Brussels, Toulouse, Boulder, Toronto and (now) Victoria. She Chairs an International Astronomical Union Task Force for preserving and digitizing astronomy’s heritage data, and also Chairs the CODATA DARTG mentioned here. One recent focus of her research has been the recovery and re-use of historic data for trans-disciplinary studies.

1. Preamble

The Memory of the World is a superb resource for scientific research that explores changes in the biosystems and the physical conditions of our planet. Many natural sciences are needing to call upon that memory nowadays in order to understand and quantify, in particular, the sorts of *long-term* changes that not only biosystems but also our physical world—its oceans, air, glaciers and deserts—are experiencing. Many of those changes appear to be substantially more radical than anything recorded during the last century, but the baseline observations which are needed for assessing the reality of trends are unfortunately not readily available for inclusion in research. Modern analyses require data to be electronic, so records that are not in that format are effectively inaccessible. That immediately excludes almost all historic data, because they were recorded on non-digital media such as paper, film, photographic plate, books or undocumented magnetic tape, and have never been transformed from that state. As a result, the very observations which are most needed to determine long-term trends cannot currently be incorporated into relevant research programmes. Modelling has become highly sophisticated, and increasingly efficient at representing the data that are supplied, but are not able to go beyond those limits with any confidence: extrapolation is unreliable in a chaotic world, and the only reliable solution is to capture in electronic form the information that is latent in so many of those pre-digital data. Though ambitious in many respects, as discussed below, such a programme will extend the publicly-accessible memory of the world backwards in time to encompass the decades when anthropogenic interference was far less vigorous than it is today.

But there are many challenges. Some historic data are deemed unusable, some are physically degrading, and all risk being destroyed through ignorance, even though the time-spans which they represent may be crucial for current research. This article introduces the topic and examines the general situation and outlook, while the following ones explore the matter from a number of different angles.

2. Two Hemispheres of Scientific Data

The power, capacity, speed and capability of modern computers has changed radically how today's researchers tackle large quantities of data and address major scientific problems. These developments are relatively new. A dozen or so years ago it was a tough challenge to import, let alone merge, data from disparate sources in order to produce a comprehensive model or extract a trend; today, current technologies are able to recognize patterns, correlations and correspondences between data that may have quite different fundamental properties.

These advances are timely indeed. The observations which are central to research into the natural world have become increasingly detailed as technology has evolved. Many modern data sets are large and complex, and their analyses involve interactive adjustments to complicated models that may require supercomputing power. The results that emerge can be used to predict how situations will change in the future. In principle, if the models are sufficiently reliable they can also be driven backwards to reproduce past conditions over a time-span that is significant compared to the recent changes that are irrefutable in an alarming number of situations. In practice, however, an extrapolation cannot have the degree of dependability that is needed, owing to the element of chaos in the natural world; the wide range of contributing factors and the subtle interplays between them can trigger the unexpected quite legitimately. A model may therefore only be valid for the time-span of the data from which it was generated.

Investigating the causes of long-term trends in the natural world has become urgent science. If recent changes are due to anthropogenic interference, the sooner each situation is understood and quantified the more likely it can be halted and even reversed. Determining the causes therefore needs observations from the decades when those anthropogenic interferences were much less widespread and vigorous than they are today. However, that immediately raises a problem, because few digital data-sets date back more than 25 years, and managed archives of most electronic data are even younger. The historical observations that are so badly needed are not in electronic form, so cannot be ingested into the modelling analyses without some specific transformation procedure. No matter what type of historic observations are called for, be it concentrations of stratospheric ozone, recordings of ocean temperatures, amounts and distribution of rainfall, counts and sizes of sunspots, bird migration patterns, frequencies of extreme weather events, behaviour of marine organisms, or a veritable host of many similar daily, seasonal or occasional events, if they were recorded on non-digital medium they will require transforming, and many may also need specialist knowledge to decode or interpret them correctly. It is a serious concern that the very data which contain vital clues to a correct understanding of how and why our natural world is changing are inaccessible to analysts, and will remain so without some major effort. They are poles apart from modern, all-digital data and managed data-bases. They are almost "lost" to the scientific world.

Fashion also plays a troublesome role. Fashion has dangerously close links with consensus, and what tends to win research funding is what captures majority interests or promises prestige for the team, laboratory or country. The resultant polarizations of data have been seriously unhealthy for the sciences that need to access historic data, and if some of those observations get discarded for whatever reason, the science loses unrepeatable measurements. Nevertheless, the pendulum of fashion does swing back. The

medical researcher, whose painstaking survey in the 1960s of patient cholesterol levels was scorned at the time, had fortunately stashed away the packs of Hollerith punched cards bearing the acquired measurements, and when they were recently re-discovered they were recognized as a gold mine of long-term data.

There is clearly significantly more to recovering heritage scientific observations than keeping artefacts from the past for their antiquarian interest. The physical form and format of the observations is of little direct relevance, except in understanding their quality and limitations. The medium is not the message; the scientific value lies primarily in the date-stamp associated with each measurement. Delving back into the past is a route to instant science, and while historic measurements may lack some of the detail of modern-day ones their uniqueness in time, and the possibility that they will supply actual records of the behaviour of a given property throughout an extended time-base, renders them of unrepeatable value.

While sterling attempts are being made in some sciences to make data rescue a major feature of the research effort, in others (and for all its advantageous infrastructure of sorted and catalogued heritage, astronomy is perhaps one of the worst culprits), the rescue efforts are left to the passionate amateur who feels deep concern at the possibility of losing historic data and who is prepared to volunteer time and effort to doing what is required. Though the efforts of the amateurs are absolutely essential, an unfortunate side-effect is to exacerbate the existing polarization between the new and the old.

One basic lesson to promote is therefore the *complementarity* of old and new: they may add information of differing quality, but interpretation relies upon both. Education will certainly help, but real-life examples of new science that was *only* possible with recovered data can be vivid teachers. What needs to be done?

3. The Dangers of Doing Nothing

There is no doubt that scientific evidence which is crucial for understanding the impact of anthropogenic interference upon planet Earth and its countless biosystems will be found in historic data. Lack of such evidence has allowed arguments that are based on opinion rather than fact, and the confusion that currently surrounds efforts to ameliorate certain situations owes a lot to news sensationalism. The longer we wait for the true facts to emerge, the harder it will be to halt the situation, or reverse it if that is what is required. But not all the problems are on a global scale, nor are all of the solutions enormously difficult to reach. There is the tragedy of the African farming family, newly settled in a region and intending to set aside extra food the following season to cope with the droughts which—they heard from somewhere—occurred every 10 years, but faced severe starvation because the actual period of the drought was 6 years, and was about to happen; the weather records were not suitably accessible. In a quite different setting, the environmentally-damaging effects of forestation with non-native species in the mountains that are sources of Cape Town's reservoirs only came to light when a small group of researchers digitized 73 years' worth of paper recordings of stream flow and uncovered a strongly positive correlation. Both examples have much to teach. In both situations the observations which could furnish essential knowledge existed, but were not accessible. The information that was needed was not complex and not overwhelmingly large to handle, nor was complicated machinery involved at any stage, just a focussed human effort. Doing nothing had inflated expense, and ruined lives.

Not infrequently, scientific measurements find application in more than one field, even in different disciplines, though it may not be the same analysts who recognise alternative uses, and the analyses need

not be simultaneous, or even close in time. Providing access to historic data in electronic form can yield unexpected side-benefits that are often far removed from the original purpose of the observations, so doing nothing denies opportunities for those initiatives. The astronomers who observed the spectra of hot stars in the near ultra-violet in the 1930s in order to study interstellar absorption features had no idea that their observations could be used to deduce the concentrations of the Earth's stratospheric ozone, and had they been able to bequeath fully digital spectra then, the data would have been seized upon at once by atmospheric scientists. Since digitization was not then an option, the spectra were left in their virgin state (but at least preserved), and it was three-quarters of a century before that ozone research could be carried out. Somewhat similarly, meteorologists are recognizing gems in the weather logs kept routinely by submarines or astronomical observatories, and atmospheric scientists see patterns in crop yields that tell as much about El Nino events as grain performance. We are now in a position to perform good-quality electronic transformations of all such records, but important background information will be harder to capture as time passes and less human memory can be tapped for the properties of the original data and their specificity. While it should not be assumed that *all* the historic information which might in principle be made accessible will contribute to a positive solution in some field, it is a sobering reflection that lives could be saved, deleterious situations avoided and damaging traits repaired by taking account of the huge wealth of heritage observational material that is presently in the world's "forgettery".

4. The Forgettery of the World

A forgettery is part and parcel of the human psyche, and a highly efficient archiving system for the brain to stash away images that may hurt, or surplus facts that are very infrequently wanted. It is also the convenient location for things unwanted; progress can only feel good if there is a forgettery to handle the casualties that got in the way. So with institutional science: technology and change are closely coupled, and new ideas should be seized while young even if the older technology and its output are not fully wound up. New technology engenders new expertise, but moving personnel from the older to the newer has the unfortunate repercussion that rather little expertise and resources remain for curating the data which were so central to yesterday's research. The world has an enormous "forgettery" of scientific records that it might once have kept for a purpose but has almost forgotten what that was. It has physical locations in attics, cupboards, closets, archive warehouses, private journals ... The challenge for today is to bring that portion of the world's forgettery into the world's growing memory, where it can offer irreplaceable contributions to today's scientific research.

Why is that still waiting to be tackled? A comprehensive programme to activate those forgotten pockets of the world's memory may seem dominated by practical difficulties, including dealing with unfamiliar data from unfamiliar equipment, and the necessary expertise may be diverse and difficult to locate, but all that is surely less challenging than (say) launching satellites to make observations of the sky or the earth, and certainly less costly. What it *will* require is a united determination to overcome the inertia which has trapped so much valuable material doing nothing in a forgettery, so the first step is to publicise and educate. That was the basic rationale for this Special Session at a UNESCO conference.

Recognizing the seriousness of the situation, CODATA (the *ICSU* Committee for Data in Science & Technology) has mandated a Data-At-Risk Task Group (DARTG) to seek out sources of non-electronic

data, and create an Inventory.¹ Time is not on our side; some of the materials to be recovered are already becoming unreadable—deteriorating magnetic tapes, recorded data without sufficient meta-data (information about the information), photographic records that have been deprived of the essential equipment to measure them correctly, or hand-written sheets whose ink is fading. CODATA is clearly late in arriving on the scene, yet the two essentials for a constructive data-rescue programme—a recognition of the need to study long-term trends (the “why”) and the capabilities of technology to manage the necessary tasks (the “how”)—have only recently moved close enough together to promise truly worthwhile returns for the efforts to be invested. The world’s forgettery can yet be rescued and put to very effective use.

5. Stages of Data Rescue

The requirements of a programme to rescue historic information are varied and demanding, but not insurmountable. Each calls upon a number of different expertises, beginning with the history of the relevant experimentation, equipment and associated personnel, and can ultimately involve a broad selection of different groups and skills, so each needs to be sympathetic to the overall objectives. The challenges of data recovery on a scale to return significant science is beset with fascinating problems that are rather rarely encountered in modern programmes. Discovering what is out there—somewhere, coping with the condition of what one finds, and arguing for the costs as part of a modern programme demand skills that involve communication, archival techniques and human interactions, and all need to be handled successfully in order to overcome the prejudice that is sometimes encountered in modern research, *viz.*, that anything that is old must be inferior. Deciphering notes in observation log-books is often highly domain-specific, and the best minds may no longer be around. Understanding the purpose of an experiment, and through it the limitations imposed upon the observations and thereby of their interpretation, will entail recourse to old publications and reports, few of which may be openly available (either printed or electronically). Converting the necessary elements of an observation into a fully-transferable electronic record demands a finesse that cannot be over-stressed, while the required meta-data (e.g., as in FITS headers) for seamless ingestion into a modern database are *sine qua non*.

Each step requires a clear vision, unambiguous procedures and well-tailored programmes with milestones, benchmarks and templates. In reality the data that one may get to work with will be in assorted condition, and each will need specialized treatment at some level, implying devoted resources. Each stage can produce unexpected challenges; it is hard to be fully prepared, and setbacks should always be allowed for in the planning time-line.

5.1 Tracking down “lost” data

The biggest hurdle is undoubtedly the initial one of communicating the incommunicable: getting researchers to discover what was put in storage probably long before their own arrival at the laboratory, observatory, library, archive or bureau in question. One approach is to follow up leads through observations that were known to have been made; those can result in unexpected discoveries too. Another is to ask people to go systematically through their storage areas and list materials that have been there for more than a specified period. Activating the trans-disciplinary potential of scientific data can sometimes trigger discoveries too; enquiries about weather records (for instance) may jog an astronomical

¹<http://ibiblio.org/data-at-risk/items>

observatory into reviving what *it* regarded as routine records for internal use only, but which may in fact be significant for environmental studies. At the other end of the scale are records generated by projects in Government laboratories and which may be protected for a period from actual destruction, but are regarded as space-wasters and are sub-optimally stored. Such caches may be the archetypal dishevelled heaps of paper, getting more scuffed when shifted and in constant peril of an order to “clear out” the cupboards or rooms when a certain age limit is reached. We may never know what potentially important records have already been lost in that way, but can be sure that it has happened and will happen again unless their scientific potential is understood. Moving a department into new facilities may have unfortunate side-effects if old records are regarded as mere trash for disposal, though it is often during such relocations that real finds are made.

5.2 The state of discovered data

Some heritage materials are formally maintained in tolerably good condition, and include most of the necessary meta-data (possibly as a catalogue), a description of the purpose and source of the data, and pointers to publications that may have ensued. “Records” may be original observations, in a variety of forms and formats, or may be the information from those observations transcribed (most frequently on paper or some type of magnetic tape) as “measurements”, either freestyle or in a pro-forma layout (e.g., a printed chart with blanks to be filled in regularly).

Most of astronomy’s worldwide collections of 3 million or so photographic plates, some dating back over 100 years, are in passable condition. But to make the data publicly available electronically requires specialized digitizing procedures entailing purpose-built equipment and trained personnel, and the resources needed for that are hard to find. In a somewhat parallel situation, the US National Climatic Data Center’s data modernization programme has a huge basement filled with files of hand-written weather records from worldwide sources. It will take a major effort to put the all information online, but the records themselves are in good condition. The Berlin botanical museum presents a different set of problems: a huge underground store houses *samples* of plant parts rather than observations of them; the archive is “live” inasmuch as new specimens are constantly being added, and the challenge is to capture electronically all the observations of the specimens, not only the meta-data but also the measurements have been carried out on them but never formally published. The very diversity of even these straightforward cases demands astute planning and design. Informing that planning is an immediate objective of DARTG’s Inventory of data at risk.

An example of well-stored but almost abandoned data is the collection of forms recording ozone measurements made in Oxford (UK) from 1933-57. Neatly bundled and ordered, the set had been almost untouched for half a century; manual transcription of the information and expert analysis filled in a major gap in recorded patterns of ozone changes during the last century.

In contrast, the IEDRO² video, *Historic Weather Data Rescue and Digitization*, displays untidy heaps of papers containing weather records, lacking even basic sorting or classification. Such heaps may get moved on, and with each move comes a loss of specific information regarding why they were saved, by whom, what they should contain, and where they originated. If the heaps (or boxfulls, closed containers or locked store-rooms) have been left undisturbed for a long time they might be found in a comparatively virgin state but deteriorating physically—ink fades, paper turns brittle, crumbles, or gets

²International Environmental Data Rescue Organization; www.iedro.org

attacked by mites or mildew, photographs discolour, emulsions become brittle and lift from their substrates, films crack, magnetic tapes oxidise and cannot be read—those are just some of the conditions that may await the investigator. A more unusual case of actual data loss is the sets of bolometric solar scans recorded on large glass plates from 1926-31 at a mountain site in Namibia; modern researchers could have mined them for information about variability in atmospheric constituents, but the plates were left abandoned on site and some have since found new life as window-glass in Namibian homes (after the offending wiggly lines were removed ...)

5.3 Influences of human attitudes

Natural ageing processes, even when speeded up by poor storage conditions and fungal infections and the like, are relatively slow compared to irreversible decisions by humans to jettison a collection because the space they occupy is wanted for some new activity, and it is sad to reflect how often the fate of such records is actually decided by ignorance. Collections have been destroyed “because no-one uses them,” but would they not be used if the information they contain were available electronically and the significance of the date-stamps properly appreciated?

The way scientific research is funded tends to exacerbate the problem. The concept of pushing a boundary backwards in time by digitizing heritage observations does not command the same prestige as building new equipment to carry out observations of world-breaking class, even though the latter projects are almost always the more expensive by a wide margin.

6. Pushing Forward

In order for its endeavour to succeed, DARTG needs to demonstrate and publicise the unique role which historic data throughout the natural sciences can very often play once they are made widely accessible in machine-readable formats. The Inventory which has been started will demonstrate the extent and types of *known* data that need to be the foci of rescue projects, whether for preserving, cataloguing or actual digitizing, and the more complete it is the better it can demonstrate the relative urgency and fragility of the various entries. DARTG’s ultimate objective is to extend the memory of the world backwards in time through a period that is scientifically significant, and conferences such as this can offer valuable platforms for broadcasting DARTG’s message and engaging broad participation by the community at large.

The excitement of scientific research is always enhanced by the discovery of the unexpected, and historic data have already provided results that were never anticipated at the time of their recording, either by those who made them or by those who now recover them. Keeping an open mind for opportunities of a trans-disciplinary nature is therefore key, both for maximizing the return on the recovery effort and for extracting new science that can stretch the imagination far beyond expectation. It is not ours to judge whether the wisdom thereby derived is more valuable because it teaches how to reforest hills, or keeps isolated farmers in touch, or measures the earth’s atmosphere through which we star-gaze, or clinches questions of climate change on a global scale. Every new turn in the zigzag path of scientific progress opens new vistas that are essential aids in an international quest to harmonize with our parent planet.

This contribution has provided some background for the Session on “data at risk”. The following three papers describe selected examples of work in progress in a variety of disciplines.

Tide Gauge Data Rescue

Patrick C. Caldwell

*Manager, Joint Archive for Sea Level, National Oceanographic Data Center (NODC), USA,
Patrick.caldwell@noaa.gov*

Abstract

Historical, non-digitized tide-gauge records are potentially of great value to the oceanographic research community as they can extend existing sea-level time series as far back as possible in order to understand more completely the time scales of sea-level change, and in particular, sea-level rise associated with climate change. At the 12th session of the Global Sea Level Observing System (GLOSS) Group of Experts (GLOSS GE XII, 7-11 November, 2011, United Nations Educational, Scientific and Cultural Organization, Paris), the topic of rescue of tide-gauge data in non-computer form (charts, tabulations, etc.) was discussed. The GLOSS GE acknowledged that a large amount of historical data remain in paper form and noted that there have been recent findings in non-oceanographic facilities such as the United States National Archives and Records Administration and the archives of the French territorial divisions. To learn more of the holdings of tide-gauge records worldwide, a questionnaire was developed and sent to national focal points for GLOSS and also to national hydrographic agencies identified via the International Hydrographic Organization. The questionnaire sought specific details on locations, time spans, sampling frequencies, and media type, volume, and quality. The responses were compiled in an inventory of the Committee for Data in Science and Technology Data-at-Risk Task Group, which seeks to assess the availability and quality of historical records from a wide spectrum of scientific and technological fields, with the long-term goal of identifying funding sources and means for transferring the old records into computer-ready format(s). This paper describes the accomplishments of the 2012 GLOSS questionnaire.

Author

Mr. Patrick Caldwell received a Bachelor's and Master's degree in meteorology from Florida State University in 1982 and 1984, respectively. He supported climate data rescue within the Marine and Environmental Protection Agency of Saudi Arabia from 1985-1986. He joined National Oceanic and Atmospheric Administration in 1987 as manager for the Joint Archive for Sea Level based at the University of Hawaii Sea Level Center.

1. Background

Objective measurements and observations are essential to the advancement of science. Within natural sciences, hypotheses on temporal and spatial variability of a given process are tested with objective theories and validated through *in situ* data. Various entities, such as national and international environmental data centers, support scientific research by maintaining large archives of readily-available, scientifically-valid, computer-ready measurements and observations. Long-lived entities, such as select museums, libraries, academic departments, non-governmental organizations, private environmental and engineering companies, and others within all branches of governmental agencies from local to federal levels, have collected and stored *in situ* environmental records. In some cases, data may be stored but are may risk loss owing to deterioration of media—or simply get forgotten. Determining what records exists can be just as daunting as the actual transformation into digital, science-ready form.

Since 2011, the International Council for Science: Committee on Data for Science and Technology (CODATA) has supported a Data-at-Risk Task Group (DARTG), whose purpose is to rescue scientific data. The international members of DARTG include data specialists in a wide range of natural and information sciences; each team member, upon whom DARTG may call, is an expert within a select discipline. The first phase is to gather information about data at risk. The collected information is placed into an on-line DARTG inventory (www.ibiblio.org/data-at-risk/items/browse/1). The motivation is to alert scientists to the existence of these valuable historical records. That awareness should facilitate funding solicitations by keenly interested researchers who seek to salvage safely the measurements and observations from their original media to contemporary electronic formats.

The author of this paper is a member of DARTG as well as the Group of Experts (GE) of the Global Sea Level Observing System (GLOSS). GLOSS was established in 1985 by the Intergovernmental Oceanographic Commission (IOC) of the United Nations Educational, Scientific and Cultural Organization (UNESCO). It provides oversight and coordination for regional and global sea-level networks in support of scientific research. The GLOSS GE has identified 290 tide-gauge sites worldwide; they constitute the GLOSS Core Network (GCN).¹ The site selection is based on several criteria; locations with minimal influence of rivers are desired to monitor better the oceanic variations. Preference is given to secure ports, which provide protection both from extreme waves and from vandalism). Sites with existing long time series are given priority.

GLOSS has designated data centers to support the securing of information about, and access to, tide-gauge measurements. Data centers are distinguished by the temporal turnaround from acquisition to on-line access and by the temporal resolution within the time series. Sea-level rescue has been an important focus of the delayed-mode centers: the British Oceanographic Data Centre (BODC), the Joint Archive for Sea Level (JASL) and the Permanent Service for Mean Sea Level (PSMSL). The BODC handles high-frequency series, defined as hourly intervals or less. The JASL, a partnership between the United States (US) National Oceanic and Atmospheric Administration's (NOAA) National Oceanographic Data Center (NODC) and the University of Hawaii Sea Level Center (UHSLC), focuses on data measured or reduced to hourly intervals, from which daily means are produced. The PSMSL is the longest-operating international sea-level repository, and has the largest number of sites and years for monthly mean sea level. All the centers acquire time series beyond the GCN. The centers share in solicitation from regional and national data suppliers, and exchange data and metadata on a regular basis.

Historical tide-gauge records are important for furthering our understanding of sea-level variations over a wide range of temporal and spatial scales. The highest frequency data provide guidance on magnitudes and durations of coastal inundations from extreme events such as tsunamis and storm surges. Regional, long tidal records have been used to study the temporal variation in tidal components.² Sea level has significant regional inter-annual through inter-decadal variations, such as seen in tide-gauge records from Hawaii.³ Historical data, through extension of the length of record for a given time series, augment statistical confidence of analysis. Studies of variations on those moderate time and space scales

and extension of records further back in time are essential for the task of defining long-term global sea-level rise.⁴

The Global Oceanographic Data Archaeology and Rescue (GODAR) project⁵ defines ‘data archaeology’ as the process of seeking out, restoring, evaluating, correcting, and interpreting historical data sets, and ‘data rescue’ as the effort to save data at risk by digitizing manuscript data, copying to electronic media, and archiving these data into an internationally available electronic database. In support of GODAR and GLOSS, several efforts have been made for sea-level data archaeology and rescue over the past two decades. During the 1990s the JASL salvaged 372 years for 34 stations of paper hourly tables, primarily acquired from the NOAA National Ocean Service (NOS) for sites within South and Central America.⁶ The BODC led a GLOSS archaeology and rescue project in 2001. Through this recovery effort and the work of individual agencies in digitizing and quality controlling paper records, 91 tide gauge series were extended backwards by 1,411 years of hourly data. The BODC has a substantial archive of approximately 3000 site years of tide-gauge charts and tabulations dating back to the 1850s. Some sites include other parameters. Most sites are within the United Kingdom and are in paper form. For eight of those stations, scanned images of the analogue tidal charts for 86 site years were made available, and of those, 45 years have been digitized. Funding has been secured to digitize 160 site years from 22 tide stations and produce scanned images of 500 site years for 14 stations, most of which date from 1890 to 1920.

At the GLOSS GE XII meeting in November 2011, the topic of data rescue was revisited. The primary motivation came from the inquiry of researchers Dr. David Jay and Dr. Stefan Talke of Portland State University (PSU), who have interests in historical records for analyses of tidal and other higher-frequency phenomena.⁷ Over the past several years they have inquired about the availability of historical sea-level records in need of rescue for tide-gauge sites within North America and the Pacific Ocean and under various international agencies. It has been determined that a large amount of records exist in non-digital form within the US National Archives and Records Administration (NARA) and the US Federal Records Center (FRC). In addition, Dr. Nicolas Pouvreau has recorded that large holdings also exist within the archives of the French territorial divisions.⁸ The GLOSS GE XII therefore decided to carry out a new inventory exercise about international holdings of sea-level data at risk, by issuing of a questionnaire to all GLOSS focal points and member representatives of the International Hydrographic Organization (IHO).

2. The Questionnaire and Responses

The questionnaire was crafted through guidance of GLOSS GE and DARTG. It was sent out in early January 2012 with a deadline for May 1, 2012 (later extended to August 1, 2012). The purpose was to build an inventory of information about sea-level data in need of rescue. The primary desired information were where records reside, for what stations and dates, on which type of media, and in what condition in terms of readability and risk of loss. Specifics were also sought about the types, makes and models of the tide gauges, the recording mechanisms, clocks, data reduction, calibration, geodetic leveling, measurement of ancillary environmental parameters at the tide station, and the availability of technical, maintenance and processing notes. It is important to learn if the historical benchmarks can be linked to the existing geodetic network for a given station. A rough estimate of the volume of the physical storage media was requested. Additional questions concerned the original purpose of collecting the data, and whether copies reside in other repositories. Inquiries were also made about possible plans by the data holders to digitize the records in the near future, and if not, whether there would be scope for collaboration with other agencies/institutions to inventory and possibly rescue the data.

There was a total of 18 replies from 14 countries. Not all replies resulted in the discovery of historical data, though several mentioned that further investigations are ongoing. From the responses, nine repositories were identified as holding historical records: the Canadian Hydrographic Service (CHS), Danmarks Meteorologiske Institut (DMI), FRC, Instituto Geografico Nacional de Espana (IGN), Land Information New Zealand (LINZ), NARA, Rijkswaterstaat Waterdienst Netherlands (RWS), Servicio de Hidrografia Naval Argentina (SHN), and United Kingdom Hydrographic Office (UKHO). There is a total of 169 tide gauge stations (Figure 1, Appendix A) holding hourly or higher-frequency data at risk, and of those, 23 are within the GCN (Table 1 and Figure 2). The extensive historical sea-level data holdings identified in French repositories by Dr. Pouvreau are not included in this summary, since they are already well documented. The Tbilisi State University (TSU) also reported data holdings from three sites in the Black Sea, with a total of 126 years of monthly mean sea level. (High-frequency data are generally preferred as they allow for a greater degree of quality control and a wider range of applications).

The largest concentrations of stations are in Europe, North America and New Zealand, with a sprinkling of sites in Africa, Asia, Pacific Islands and the Caribbean. Only one site was identified in South America. The total time-span of those records adds up to 4,103 years, though excluding known gaps reduces the total to 3,259 years. (It is likely that there are additional gaps, so that number is still biased high). Data from some of those years have already been rescued and reside in GLOSS data centers. If digitized and quality controlled, these historical records could add 2,824 years of hourly data to the JASL, and 1,897 years of monthly mean sea-level data to the PSMSL. For GCN sites, they would add 324 years to the JASL and 270 years to the PSMSL.

The available non-digital records are of varying time spans (Table 2 and Figures 3 and 4). The time spans for the seven Danish sites are more than 80 years, though the degree of missing spans has not been determined. The FRC holdings for lengths greater than 30 years are most likely to have major gaps. The number of sites with newly identified series lengths greater than 30 years is 40, which represents 24% of the total, and of those, 35 series could be added to the JASL and 24 to the PSMSL. For GCN sites, rescuing those records could add spans longer than 30 years for 5 series to the JASL and 3 to the PSMSL.

The questionnaire included a number of items that could provide general technical information about the historical records (Table 3). The majority of the available historical records are in the form of analogue traces. Such pen traces are also referred to as marigrams, tide graphs or tidal charts. Only about

30% of the records have already been tabulated to numerical form as hourly or high/low-tide values. The vast majority of the media used is paper; only one station used film. The media and readability are good for 40% of the sites and of varying quality for 52%, while only 2 sites were described as poor. There were no confirmations that hard copies of the records were stored in other locations. The tide-gauge type was the standard float and stilling well for 42% ; only 4% used pressure or siphon gauges. The rest had an unconfirmed gauge type, though it was assumed most were of the float/well type. Station maintenance notes were documented for 45% of the sites; only one site was without any, but the rest were unconfirmed. Ancillary parameters of temperature, atmospheric pressure, and wind were taken at three sites; 15 sets did not having other measurements, and the rest gave no information. The inquiry as to why the data were originally collected gave the main motivation as being hydrography for port operation, including tide predictions and determinations of mean sea level to define data for navigational charts. Others noted geodesy in general, which could apply to near shore or land-based applications such as defining regional or national data. For the Danish sites, the need for knowledge about extreme water levels was also noted as a motivation.

Linking the gauge data to a vertical reference level is essential for most scientific applications. Daily visual tide pole or staff readings were historically the primary means of calibration. The tide staffs are linked to a network of land-based benchmarks through periodic geodetic surveys to determine any vertical movement of the station platform and to link the tide data to regional or national geodetic data, which could be tied to the same benchmarks. Tide-pole readings were confirmed for 46% of the sites, and only one site was noted as having only some sets available; no sites were declared void of readings. For the unconfirmed set, it is assumed that most have such readings since it has always been standard practice. Benchmark maps are available for 31% of the sites, though the rest were unconfirmed except for one. Historical geodetic surveys taken at the time of data collection were reported as being available for 40% of the stations, with only one confirming that none was available; the rest were unconfirmed. For 45% of the sites, the historical data can be tied into the present geodetic network, though most were unconfirmed. All of the agencies confirmed their support to GLOSS for access to these historical records.

3. Concluding Remarks

The GLOSS 2012 data archaeology and rescue questionnaire determined that a vast amount of historical tide gauge measurements exist in non-electronic form. Those measurements augment the large summary identified in French repositories and documented by Dr. Pouvreau. However, it is also recognized that participation in the questionnaire was only moderate, considering the large number of national contacts representing GLOSS and IHO. Among the replies, several contacts mentioned that an investigation is pending. Part of the reason is that the records for a given nation probably reside in disparate locations which are not readily near the GLOSS or IHO contacts. Thus, one conclusion from this effort is that additional searches of repositories need to be undertaken; that would require support or funding from national or international entities, plus willing national scientific/hydrographic/historical champions to perform the task.

One possible avenue for enlarging the effort could be to coordinate with other international groups that have similar goals, such as the Atmospheric Circulation Reconstructions over the Earth (ACRE) program. It is likely that many of the repositories holding data of interest to ACRE could also have sea level records. Thus, for example, if an individual searching for atmospheric data came across sea-level data, then a note could be made, and vice-versa. Other lessons learned in data archaeology and upcoming

plans of ACRE could be shared with GLOSS through collaborations. It is expected that a representative of the GLOSS GE will participate in the ACRE workshop in November 2012 (Toulouse, France).

The GLOSS questionnaire revealed that 24% of these discovered records are for time series with lengths greater than 30 years. Recovery of those data into scientifically-valid forms would add substantial lengths of record for many series. Such data could enhance the confidence in assessment of long-term global sea-level rise. Many other applications are possible for shorter times and/or more regional space scales, such as case studies of extreme events. The information from the GLOSS questionnaire will be made public through the GLOSS communication channels and the DARTG inventory. The inventory will be updated as new discoveries are made or if more detailed information is made available regarding missing years, such as in the case of the unknown gaps in the Danish and FRC sites. This study represents only the first stage of discovery of potential sources. It is hoped that this information will fuel the interest of researchers willing to seek funding and support for salvaging these records into computer-ready, high-quality data.

Acknowledgments

Thanks are due to Philip Woodworth, Lesley Rickards, Guy Woppelmann, Thorkild Aarup, David Jay, Stefan Talke, Sydney Levitus and Elizabeth Griffin for helpful comments during the preparation of the questionnaire and for constructive reviews of a draft of this paper. Stephen Shipman (IHO) is recognized for his support in sending the questionnaire to IHO national hydrographic contact points. Thanks are also due to the individuals and agencies that replied and provided information to the survey: Stefan Talke and David Jay (PSU, US), Shigalla Mahongo (Tanzania Fisheries Research Institute), Koos Doekes (RWI, Netherlands), Maria Jesus Garcia Fernandez (Spanish Oceanographic Institute), Puyol Montserrat Bernat (IGN, Spain), Afranio Mesquito (University of Sao Paulo, Brazil), Cesar Borba (Naval Center for Hydrography, Brazil), Juan Fierro (Hydrographic and Oceanographic Service of the Chilean Navy), Giorgi Metreveli (TSU, Georgia), Christoph Blasi (German Federal Institute of Hydrography), Palle Bo Nielsen (DMI, Denmark), June Thompson (UKHO, United Kingdom), Anne Ballantyne (CHS, Canada), David Wyatt (IHO, Monaco), Glen Rowe (LINZ, New Zealand), Angora Aman (University of Cocody, Cote d'Ivoire). Finally, thanks are given to NOAA and UHSLC for providing daily support for the author.

Table 2. (A) A summary of the site counts (#) and percent of total (%) as a function of series length. The length excludes gaps. “All” pertains to the cumulative discovery of records. “JASL” refers to sites and years that potentially could be added to the JASL and similar for “PSMSL”. (B) This table follows the same theme though exclusively for GCN sites.

(A)		<=5 yr		5>yr<=15		15>yr<=30		30>yr<=60		>60 yr	
	sites	#	%	#	%	#	%	#	%	#	%
All	169	52	31	52	31	25	15	27	16	13	8
JASL	159	54	34	48	30	22	14	24	16	11	7
PSMSL	134	51	38	46	34	13	10	20	16	4	3
(B)		<=5 yr		5>yr<=15		15>yr<=30		30>yr<=60		>60 yr	
	sites	#	%	#	%	#	%	#	%	#	%
All	24	5	21	8	33	4	17	6	25	1	4

Figures

Figure 1. Plot of the station locations by repository for identified historical data in need of rescue.

Figure 2. Map showing the locations of GCN sites with identified historical sea level data.

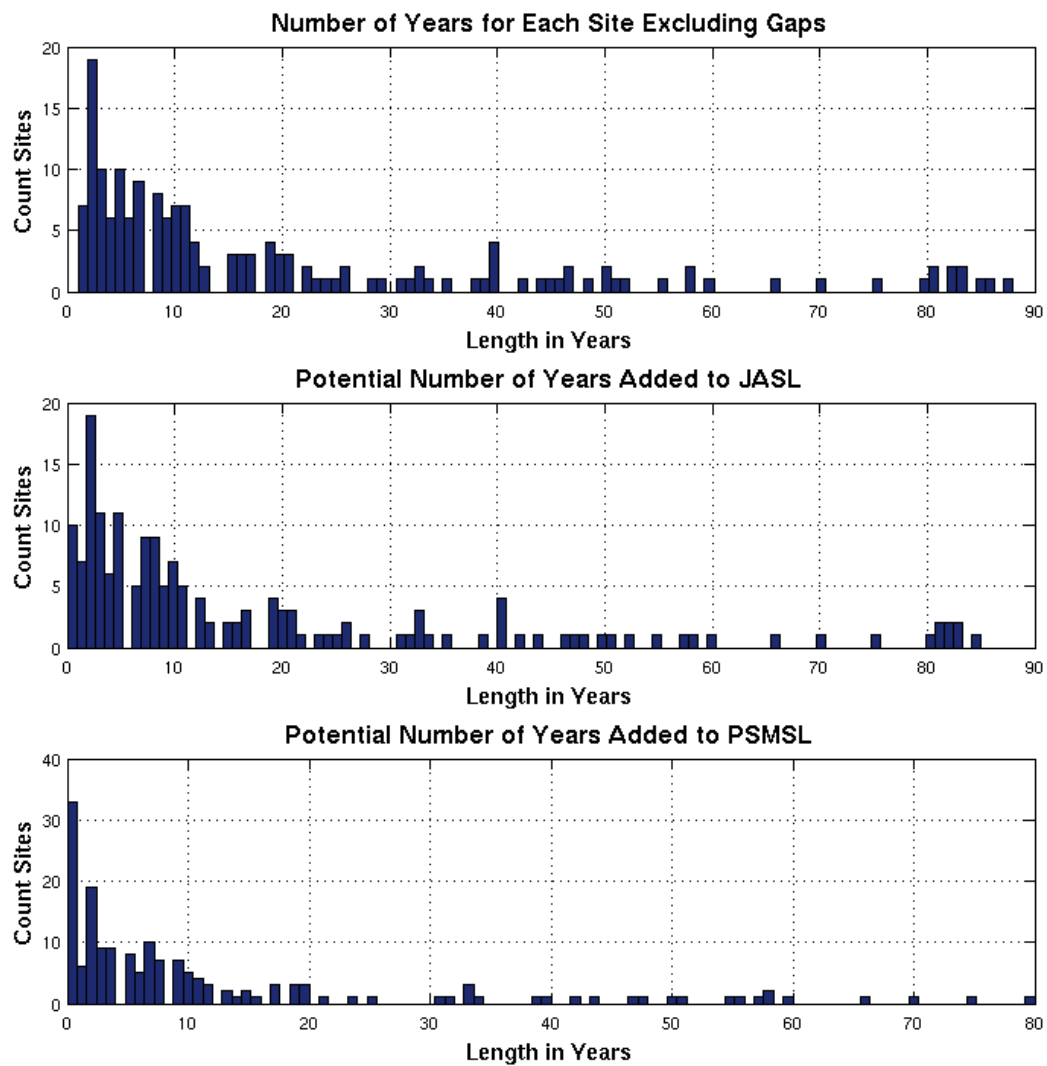

Figure 3. The site counts as a function of record length for the entire set excluding gaps, for the potential additions to the JASL, and same for PSMSL.

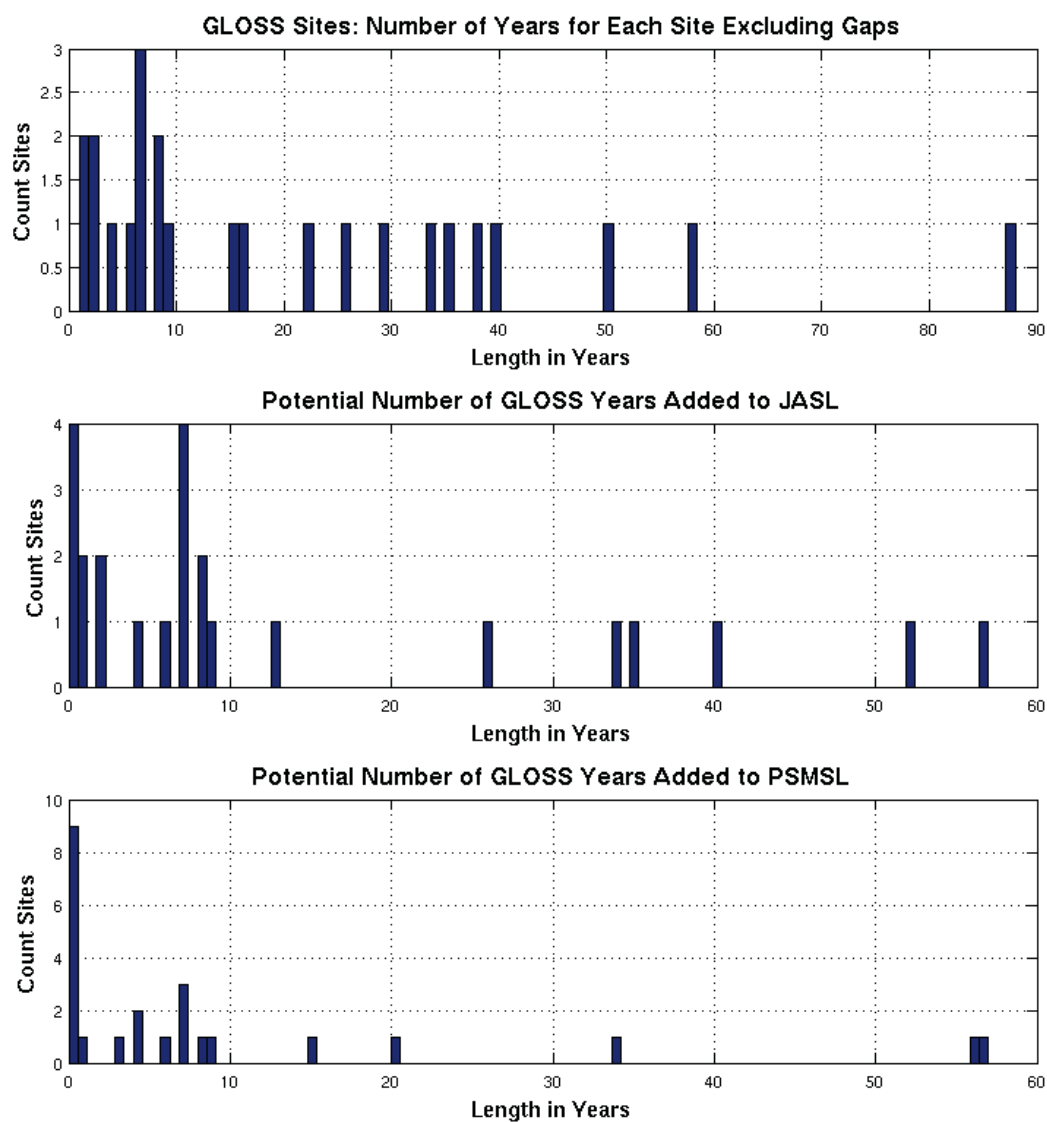

Figure 4. As for Figure 3, but exclusively for GCN sites.

Appendix A

Tide-gauge stations identified by the 2012 GLOSS questionnaire as having data at risk. The large quantity of data records in French repositories, as identified by Dr. Pouvreau, are not included.

Environmental Data Through Time

Extending The Climate Record

Stephen Del Greco

Chief Climate Services and Monitoring Division, National Climatic Data Center (NCDC), National Oceanic and Atmospheric Administration (NOAA), USA, Stephen.A.Delgreco@noaa.gov

Abstract

The National Oceanic and Atmospheric Administration (NOAA) National Climatic Data Center (NCDC) is responsible for acquisition, archive, and dissemination services for climate and environmental data and information that fulfill much of the Nation's climate data requirements. Those include stewardship for in situ, satellite and radar data and information. Over 5 petabytes of data reside in the archives, and growth trends over the next several years are expected to increase tenfold. The Center is also assigned the analytic role of describing the climate and providing scientific assessments, such as the Climate Change Science Program (CCSP), "State of the Climate" reports and National and Global Assessments. Towards that end, NCDC has several programs that involve extending the climate record, and the NCDC led the Climate Database Modernization Program (CDMP). CDMP provided substantial funding between 1999 and 2012 to rescue and preserve historic climate and environmental data. CDMP has currently placed online over 57 million images and some 14 terabytes of weather and environmental data. In addition, hourly weather records keyed through CDMP continue to be integrated into NCDC's digital database, extending the period of record for many stations back into the 1800s.¹ Millions of data images available online also have associated environmental data that need to be digitized. NCDC is using its remaining CDMP resources and Crowdsourcing to digitize and analyse those climate data. In partnership with the Cooperative Institute for Climate and Satellites (CICS), it is deriving Climate Data Records (CDRs) for atmosphere and terrestrial features using satellite data (Global Essential Climate Variables) that date back to the 1970s. The Center also performs research in Paleoclimatology. Paleoclimate data come from natural sources such as tree rings, ice cores, corals, and ocean and lake sediments and extend the archive of weather and climate information back hundreds to millions of years. The Center maintains the world's largest archive of climate and paleoclimate data. While it is important to highlight the development of proxy datasets using paleo data and the development of satellite-based CDRs, this paper focuses on extending the climate record by rescuing past observational data.

Author

Stephen Del Greco is the acting Chief of NOAA's National Climatic Data Center (NCDC) Climate Services and Monitoring Division (CSMD). He provides oversight, leadership and management for CSMD activities that include User Engagement and Services, Climate Monitoring and Assessments, Data Access and Applications, and Regional Climate Services. The division develops and maintains systems to meet NOAA planning and execution for data discovery, data dissemination, data display and data interoperability. The division also delivers climate products to operations in support of assessment of the State of the Climate Regionally, Nationally and Internationally. Stephen's primary focus is providing climate services and robust access capabilities for weather and climate information using data federated systems and tiered services. He holds a degree in Atmospheric Sciences from the University of North Carolina and attended Harvard University, John F. Kennedy School of Government, Public Service Executive Education program.

Truesdell, "NOAA's Climate Data Modernization Program Paving the Way for Data Stewardship," in *91st AMS Annual Meeting, 22-27 January 2011, New Orleans, LA, 27th Conference IIPS [International Conference on Interactive Information and Processing Systems for Meteorology, Oceanography, and Hydrology]*, American Meteorological Society, Boston, Mass., File 4B.4 (January 2011).

1. NOAA partnerships for data rescue - U.S. data

In partnership with the private industry, the NOAA's NCDC imaged and keyed over 56 million images and over fourteen terabytes of data from paper and microfilm records. Those data are available free of charge via the Image and Publication System for images (IPS)² and the Climate Data Online (CDO) System for digital records.³ While NCDC continues to image and digitize retrospective weather and climate data using remaining CDMP resources, the center is partnering with other institutions and also transitioning to using public volunteers to digitize records through crowdsourcing⁴ and Citizen Science Alliance⁵ programs. Several completed and/or ongoing projects and partners are listed and briefly described below:

1.1 Surface Airways Observations (SAO) Project

NOAA contributed to extending the U.S. climate record by rescuing National Weather Bureau and National Weather Service (NWS) Surface Airways Observations (SAO) data for NWS sites dating back to 1893. The project imaged over 2 million forms and keyed over 400 million hourly surface observations records and added over 50 years of hourly/synoptic data for over 700 U.S. locations [figure 1]. The SWO library is the largest in IPS.

1.2 U.S. Founding Fathers Weather Journals

Weather and climate data recorded by George Washington, Thomas Jefferson and Benjamin Franklin and other colonists are archived in original manuscripts, microfilmed and stored at the National Archive and Records Administration (NARA). The records were also imaged and are available on IPS. These colonial diaries and data are a treasure trove for the climatologist seeking data on climate of the 18th and 19th century [figure 2].

1.3 U.S. Forts Project

NOAA partnered with the Midwest Regional Climate Center⁶ to image and digitize historical climate data from U.S. Army forts. The "Forts Project", focused on imaging and keying data from 1820-1892 for Army forts; however, other sources of climate data, such as Smithsonian Institution's 19th century network of voluntary observers, United States Signal Service observations and private citizen observation journals, were included in the program. The digitized data went through extensive quality control processes prior to becoming available to the public; the forms [figure 3], some almost 200 years old, are available on IPS, and the digitized data on CDO.

1.4 Shoreline Vectorization - National Ocean Service/Coastal Services Center

A digital national shoreline database used for spatial analysis of coastal areas. Rescue work converts topographic sheet images to a geo-referenced vector format. These shoreline data are used to help protect

coastal resources, sustain the environmental quality of the coastal environment, and mitigate impacts from coastal processes.⁷

1.5 Defense Meteorological Satellite Program (DMSP) Film Imaging - National Geophysical Data Center

Scanning of DMSP film from the early 1970s to the mid-1980s. The DMSP film contains observations relevant to global cloud climatology, hurricane and typhoon climatology, the extent and conditions of polar ice, continental and mountain snowpack, and the record of expansion in human settlements.⁸

1.6 Imaging of NOAA Central Library Holdings - NOAA Central Library

Imaging of foreign climate data books; U.S. daily weather maps from 1871 to the late 1960s; and, in coordination with the American Meteorological Society, imaging of the Monthly Weather Reviews. These images are made available online at the NOAA Central Library.⁹

1.7 Imaging of Historical U.S. Coast Pilot Editions - National Ocean Service/Office of Coast Survey

The Coast Pilot collection consists of approximately 800 volumes from the 1800s to today. The volumes are available online at the Office of Coast Survey and the NOAA Central Library. The collection includes significant navigation information, and descriptions and locations of localized atmospheric features and conditions.¹⁰

1.8 Digitization of Ionospheric Data - National Geophysical Data Center

Digitization of ionosphere bottom side vertical incidence sounding data values from the 1930s through 1957. The paper media contain both half hourly and hourly data.¹¹

1.9 Digitization of U.S. Upper Air Pilot Balloon (Pibal) Data - National Weather Service

Imaged (from film) and keyed U.S. pibal observations prior to 1948.

2. NOAA partnerships for data rescue - International Projects

NOAA partnered with 27 countries across several continents to rescue surface, marine and upper air data. For example NOAA partnered with the World Meteorological Organization¹² to rescue weather balloon upper air data in seven African nations: Kenya, Malawi, Mozambique, Niger, Senegal, Tanzania and

Zambia [figure 5]. The African countries imaged their data locally, and sent the images to NOAA's NCDC for keying and uploading to IPS and NOAA's Integrated Global Radiosonde Archive Database (IGRA).¹³ IGRA consists of radiosonde and pilot balloon observations at over 1500 globally distributed stations [figure 6]. Observations are available for standard surface, tropopause and significant levels. Variables include pressure, temperature, geopotential height, dew point depression, wind direction and wind speed. Over 150,000 images of pibal (upper air wind) records from the 1940s to 2003 from the 7 African countries are digitized. The digital data files were also provided to the host countries that imaged the data while the keyed data files are hyperlinked to the actual images, providing an easy access to the original records. Another data rescue example is the partnership with the United Kingdom to image and digitize the marine logbooks in the British Archives. It included the English East India Company (EIC) Instrumental Observations 1789-1834. The Met Office Hadley Center imaged over 1100 of the original 2000 logbooks of the English East India Company (EIC) held at the British Library. The selection of logs was based on their holdings of weather observations, visual and instrumental, as well as the significant spatial coverage of voyages from England to India and China through the Atlantic, Indian and Southern Oceans during those years. The EIC collected commenced well before the landmark 1853 Brussels Maritime Conference¹⁴ devoted to coordinating an international effort for global systematic collections of marine instrumental and visual observations, and is probably the largest and earliest collection of such systematic instrumental observations. The project captured all noon observations containing location, instrumental observations of pressure and air temperature (and occasionally sea surface temperature), and visual estimates of winds, state of weather and state of sea. From the digitized logbooks, over 285K observations were digitized, significantly increasing early instrumental coverage both spatially and temporally.¹⁵

2.1 Crowdsourcing

Rescue of United Kingdom marine data continues. Weather observations made by Royal Navy ships around the time of World War I were recently digitized as part of a Zooniverse (crowdsourcing)¹⁶ project called oldWeather.¹⁷ Volunteers digitized over 1 million, six hundred thousand Royal Navy-derived weather observations. That was the first phase for the project; oldWeather is currently in phase two, to digitize weather observations by ships in the Arctic. The citizen volunteers have completed 46% of the ship logs for recovering Arctic and worldwide weather observations made by United States ships since the mid-19th century.

3. Paleoclimatology – Extending the climate record using “proxies”

Paleoclimatology is the study of past climate prior to instrumental weather measurements. Paleoclimatologists use information from natural climate “proxies,” such as tree rings, ice cores, corals,

¹³ Integrated Global Radiosonde Archive Database (IGRA), <http://www.ncdc.noaa.gov/oa/climate/igra/index.php>.

¹⁶ Zooniverse web page, <https://www.zooniverse.org/>.

¹⁷ oldWeather web page, <http://www.oldweather.org/>.

and ocean and lake sediments, that record variations in past climate [figures 7, 8]. Records of past climate from such proxy records are important for several reasons. Instrumental records of climate are limited in many parts of the world to the past 100 years or less, and are too short to assess whether climate variability, events, and trends of the 20th and 21st centuries are representative of the long-term natural variability of past centuries and millennia. For example, was the 1930s Dust Bowl drought, a widespread and severe event in the United States, a rare occurrence or have similar events occurred in past centuries? Knowledge of the long-term natural variability of the Earth Climate system, and its causes, will also allow an understanding of the roles of natural climate variability and human-induced climate change in the current and future climate. In particular, reconstructed temperatures from proxy data for the past 1000 years have allowed an assessment of the warming over recent decades.¹⁸

4. Climate Data Records – Extending the climate record using satellite data

NOAA's NCDC recently initiated a satellite Climate Data Record (CDR) program to provide continuously objective climate information derived from weather satellite data that NOAA has collected for more than 30 years. Those data comprise the longest record of global satellite mapping measurements in the world, and are complemented by data from other sources including NASA and Department of Defense satellites and foreign satellites. The mission of NOAA's Climate Data Record Program is to develop and implement a robust, sustainable, and scientifically defensible approach to producing and preserving climate records from satellite data [figure 9]. For the first time, NOAA is applying modern data analysis methods, which have advanced significantly in the last decade, to these historical global satellite data. The program will unravel the underlying climate trend and variability information and return new economic and scientific value from the records. In parallel, NCDC will maintain and extend these Climate Data Records by applying the same methods to present-day and future satellite measurements. The results will provide trustworthy information on how, where and to what extent the land, oceans, atmosphere and ice sheets are changing. In turn, this information will be used by energy, water resources, agriculture, human health, national security, coastal community and other interest groups. The CDR data will improve the Nation's resilience to climate change and variability, maintain our economic vitality, and improve the security and well-being of the public.¹⁹

5. Conclusion

OldWeather project's mission statement, "Old Weather: Our Weather's Past, the Climate's Future" is one that resonates with climatologists. To gain better understanding of the earth's physical processes and the future state of the climate it is essential to be able to reconstruct past climates. NOAA continues to work with partners in both the public and private sectors to look for innovative ways to rescue retrospective weather and climate data from deteriorating media, and to make the data available in digital formats and accessible online for the public. Once converted into electronic formats, the data are more portable, can quickly and easily be shared, and contribute further to global climate studies.

The Map as a Fundamental Source in the Memory of the World

Tracey P. Lauriault¹ and D. R. Fraser Taylor²

¹Postdoctoral Fellow, Geomatics and Cartographic Research Centre (GCRC), Carleton University, Canada, tlauriau@gmail.com; ²FRSC, Distinguished Research Professor and Director of the Geomatics and Cartographic Research Centre, Carleton University, Canada; member of the CODATA Data at Risk Task Group, fraser_taylor@carleton.ca

Abstract

Maps and spatial information have been fundamental facets of the memory of societies from all over the world for millennia, and their preservation should be an integral part of government strategies in managing digital data. The digital era in map-making is a relatively recent activity; the first digital maps date from the 1960s. Digital mapping has accelerated very rapidly over the last decade and is now ubiquitous with an increasing amount of spatially referenced information being created by non-governmental organizations, academia, the private sector and government, as well as by social networks and citizen scientists. Unfortunately, despite that explosion of digital mapping little or no attention is being paid to preservation. As a result, the very maps that have been such a fundamental source of scientific and cultural information are now seriously at risk. Already we are losing map information faster than it is being created, and the loss of that central element of the cultural heritage of societies all over the world is a serious concern. There has already been a serious loss of maps; the Canada Land Inventory and the 1986 BBC Domesday Project are only two such casualties, and mapping agencies all over the world are struggling to preserve maps in the new digital era. It is somewhat paradoxical that it is easier to get maps that are hundreds, and in some cases thousands, of years old than maps of the late 20th and early 21st centuries. This paper examines the opportunities and challenges of preserving and accessing digital maps, atlases and geospatial information, all of which are Canada's cultural and scientific knowledge assets.

Authors

Dr. Tracey P. Lauriault is a Postdoctoral Fellow at the Geomatics and Cartographic Research Centre working on the SSHRC Partnership Development Project entitled Mapping the Legal and Policy Boundaries of Digital Cartography in collaboration with the Centre for Law, Technology and Society; the Canadian Internet Public Policy Clinic and Natural Resources Canada. She also participates in activities and represents the GCRC on topics related to the access to and preservation of data. As a citizen she is an open data advocate and is the co-founder of civicaccess.ca and datalibre.ca.

Dr. Professor Taylor is a Distinguished Research Professor of International Affairs and Geography and Environmental Studies at Carleton University, Canada and is also Director of the Geomatics and Cartographic Research Centre. He is a Fellow of the Royal Society of Canada and is widely recognized as one of the world's leading cartographers. Dr. Taylor's main research interests in cartography lie in the application of geographic information processing to the analysis of socio-economic issues and the presentation of the results in the form of cybercartographic atlases. Cybercartography is an innovative new concept which he first introduced in 1997. His current funded research involves working with aboriginal and Inuit communities to empower these communities to express their perceptions of their own environmental and socio-economic reality in new ways utilizing the Cybercartographic Atlas Framework. This includes the innovative open source software called Nunaliit. Dr. Taylor is Chair of the International Steering Committee for Global Mapping (ISCGM) and the International Advisory Group on the Arctic Spatial Data Infrastructure, he is also a member of the Mapping Africa for Africans Working Group of the International Cartographic Association, a member of the Joint Board of the Geospatial Information Societies and a member of the UN initiative on Global Geospatial Information Management.

1. Introduction

Maps do more than help us locate things. Maps and atlases, like books, reports, and archival records, enable us: to understand the territorial evolution of our nations, to see how colonial surveyors drew property boundaries, to visualize the spaces negotiated in treaties, and to assess the distribution of population and national resources. They can model climate change, the economy, or display the spatial relationships between cities, infrastructure and society. Maps inform planning, policy and economic decisions, while also shaping how we imagine spaces. They delight, are repositories of cultural and scientific knowledge and are a key part of our collective geographical memories.

In Canada, all levels of government create maps. At the Federal level, Natural Resources Canada (NRCan) produces, acquires and maintains the largest collection of maps, satellite and radar imagery, air photos, geospatial datasets, and publishes the *Atlas of Canada*. These are disseminated via geospatial data portals, map servers, and special programs such as *GeoGratis*. NRCan is also home to Canada's Geospatial Data Infrastructure (CGDI), which comprises the open and interoperable standards, specifications, practices, technology, framework data, operational policies and institutional environment to disseminate Canada's geospatial data assets on the Internet. Numerous other federal departments also produce geospatial data.¹ Geospatial data also represent the largest collection of freely accessible datasets currently being disseminated in the Treasury Board Secretariat's (TBS) Open Data Pilot portal.² Provincial and territorial governments also produce maps, are responsible for cadastres, and have geospatial databases to help manage transportation networks, watersheds, natural resources and to administer programs such as health and education. At the level of the city geographic information system (GIS) units can be found within information technology (IT) sections to manage infrastructure and other municipal responsibilities. Academic institutions create maps and atlases which are normally funded by government granting agencies, foundations or special programs such as the International Polar Year (IPY). Canadian non-governmental organizations (NGOs) produce maps on a variety of topics such as food security, water quality and population health. The private sector through companies such as Google, Autodesk, and ESRI is a major producer of digital maps and geomatics products in Canada and is a multibillion-dollar industry.³ The public and communities are also engaged in map-making endeavours by contributing volunteered geographic information (VGI)⁴ into Mashups,⁵ building local infrastructures,⁶

¹ For example the Public Health Agency of Canada; Fisheries and Oceans; Environment Canada; Aboriginal Affairs and Northern Development Canada; Citizen and Immigration and many others.

³ See Statistics Canada, *Surveying and Mapping Services Bulletin*, (2010) Catalogue no. 63-254-X, available at <http://www5.statcan.gc.ca/bsolc/olc-cel/olc-cel?catno=63-254-XIE&lang=eng#formatdisp> (accessed 28 August 2012).

⁴ VGI is georeferenced user-contributed information that is collected and disseminated in such a way that others can use them. For more details see Teresa Scassa, "Legal issues with volunteered geographic information," 2012, *Canadian Geographer*, available at <http://onlinelibrary.wiley.com/doi/10.1111/j.1541-0064.2012.00444.x/abstract> doi:10.1111/j.1541-0064.2012.00444.x.

⁵ The Regroupement activists pour l'inclusion Québec (RAPLIQ), with Montreal Ouvert and OpenNorth collaborated to create a prototype accessibility audit of commercial establishments. People with disabilities collected VGI data and these were mapped using GoogleMap's open API. The Montréal Accessible mashup is available at <http://montrealaccessible.ca/> (accessed 18 August 2012).

⁶ The Canadian Council on Social Development (CCSD) created a membership based consortium called the *Community Data Program* that includes myriad georeferenced demographic and socio-economic data available at <http://communitydata-donneescommunautaires.ca/Home>. The Social Planning Council of Ottawa has created a Community Information and Mapping System (CIMS) as seen here <http://www.cims-scic.ca/> (accessed 29 August 2012).

creating mobile device apps,⁷ and by being engaged in participatory mapping⁸ or citizen science endeavours.⁹ Digital maps and geospatial data are ubiquitous artefacts in the 21st century.

Geospatial data, maps and atlases, have been produced for millennia,¹⁰ and are cultural, historical and scientific records of knowledge and advancement, which makes them a fundamental source in memory of the world. This source of knowledge, in its borne digital form, is however not being systematically preserved. The digital era in map making is a relatively recent phenomenon of the last fifty years¹¹ and has accelerated very rapidly over the last decade as software has become easier to use and are less expensive, geospatial data are more accessible, organizations have opened their application programming interfaces (APIs) and Internet social networking services have proliferated.

Unfortunately, little, or no, attention is being paid to preserving maps, atlases and their related data whether created by authoritative or non-authoritative sources, as a result, these are very much at risk. Already we are losing spatial information faster than it is being created and the loss of this central part of the cultural heritage of societies all over the world is a serious concern.

This paper will consider seven related topics. It will begin by illustrating the problem by discussing two map and atlas rescue and salvage endeavours. Secondly, cybercartographic atlases are now mapping traditional knowledge (TK) by applying participatory research techniques. These are considered by the Indigenous communities involved repositories of local, cultural, scientific and historical knowledge. In creating these atlases preservation is considered from the outset even though an adequate archive to ingest them has still not emerged. Thirdly, while most geospatial data in Canada are not preserved, there are some geospatial data archives and these will be discussed. Fourthly, data management (including preservation) and access has become a key policy issue in Canada and a number of national public consultations on the topic have taken place. Their outcomes will be reviewed. Fifthly, there are Canadian legislation, directives and policies, which mandate the management of government information assets, and a brief overview of those related to spatial data will be examined. Sixthly, geospatial data and maps are also official government records explicitly referred to in Canadian acts and regulation and those for which the Minister of NRCan is responsible are discussed. Seventhly, the preservation of maps, atlases and geospatial data has been examined in Canadian research and some results are showcased. Finally, the paper will conclude by examining the key issues presented and will suggest strategies for the preservation of these cultural and scientific assets.

⁷ Open data initiatives make data accessible to developers who create GeoApps such as *Restonet* (<http://restonet.ca/>) which maps food inspection results; Edmonton's *Historic Buildings Android App* (<http://contest.apps4edmonton.ca/apps/21>) or the BC Apps4ClimateChange contest apps such as *Waterly* (<http://www.waterly.ca/>) which tracks rainfall and combines these with watering restrictions providing users with a watering schedule.

⁸ The Inuit Sea Ice Use and Occupancy Project (ISIUOP), which produced the Inuit siku (sea ice), *Atlas* (<http://sikuatlas.ca/index.html>) which include data contributed and mapped by Inuit hunters and elders.

⁹ The *Water and Environmental Hub* (WeHub) project “is a cloud-based, open source web platform that aggregates, federates, and connects water data and information with users looking to download, analyse, model and interpret water and environmental-based information”. Citizens can upload their data to the system available at <http://www.watereenvironmentalhub.ca/about/project>. Also see Digital Fishers where citizens load observations into a crowdsourced database and analyse results, available at <http://digitalfishers.net/> (accessed 18 August 2012).

¹⁰ For example: the Bedolina and Giadighe petroglyphs at Valcamonica (2500 BC), Çatal Hüyük (6200 BC) wall paintings, the Hecataeus of Miletus *Geographica* maps (c. 550 – 476 BCE), and Ptolemy's World Map (circa 150).

¹¹ The Canada Geographic Information System (CGIS) developed in 1960s is recognized as the first operational GIS. Dr. Roger Tomlinson who was then based Department of Forestry and Rural Development developed it.

2. The Rescue and Salvage of the Canada Land Inventory (CLI) and the 1986 Domesday Project

The Canada Land Inventory (CLI) was initiated in 1960 by the Department of Forestry and Rural Development. In 1963 the Canadian Geographic Information System (CGIS) was developed to automate the data management and mapping of CLI data. The CGIS was the world's first GIS, it was a milestone in the history of geographic and government computerization and it revolutionized mapping. One of the principal driving forces behind the CGIS "was the idea that the CLI maps could be interpreted and analysed in a myriad of ways if the information could be manipulated by computers."¹² It was established "as a joint federal-provincial project to guide the development of policy on the control and management of land-based resources."¹³ The CGIS ultimately grew to contain thousands of maps and unknowingly became a technology that "spawned an industry that today is worth billions of dollars."¹⁴ The CLI was conceived to "classify lands as to their capabilities; to obtain a firm estimate of the extent and location of each land class and to encourage use of CLI data in planning."¹⁵

The CLI was an incredibly ambitious program that mapped 2.6 million square kilometers of Canada and "the original cost of the program was in the order of 100's of millions of dollars in the 1970's."¹⁶ The CGIS was both a set of electronic maps and the "computer programs that allowed users to input, manipulate, analyse, and output those maps."¹⁷

By the late 1980s, the CGIS was no longer being used. Priorities changed, people retired, and institutional memory was fading. Numerous boxes of tapes and racks of documentation were left behind and only a few computers were capable of reading nine track tapes let alone run the programs. In 1995, an informal trans-organizational group of individuals from Statistics Canada, the *National Atlas of Canada*, Archives Canada and the private sector joined forces to restore it. Fortunately members of this salvage team had either formerly worked on the CGIS or had an interest in its preservation, which meant they had the requisite skills, knowledge, and more importantly they recognized the value of these data and knew that these were part of Canada's technological and scientific heritage that could be repurposed into other applications. On June 18, 1998, the agriculturally relevant portions of the CLI were handed over on one CD and it worked flawlessly on the analytical tools built in anticipation of the new format and eventually the CLI was distributed in the *GeoGratis*¹⁸ portal for free along with metadata and some text to help

¹⁸ *GeoGratis* disseminates geospatial data at no cost and without restrictions to the public. It is the first open data initiative in Canada and was the first to adopt an unrestricted user licence, it is available at <http://geogratis.cgdi.gc.ca/geogratis/en/index.html> (accessed 21 August 2012).

interpret the content. The CLI “rapidly became their most popular product.”¹⁹ Not all of the CLI data were saved and the cost of the effort described above was very substantial. The CLI has become the common basemap in *Atlas of Canada*²⁰ maps, layers are used to train satellite imagery software to recognize land cover patterns in remotely sensed images²¹ which are then used to inform the managing of forests and agricultural areas among many others resources.

The UK 1986 Domesday project, like the CGIS, was groundbreaking and a milestone in the history of multimedia computing. It was started by the BBC in 1984 to celebrate the 900-year anniversary of the original William of Normandy 1086 Norman Domesday Survey. The 1986 Domesday project, was conceived as an ‘electronic exhibition’ displaying British life much like the Great Exhibition of 1851.²² It was an interactive atlas that relied on crowdsourced VGI enlisting the help of 14,000 British schools and students. School microcomputers were mobilized to collect survey data, neighbourhood stories and pictures. These data “were combined with thousands of maps, still photographs and central statistical, written and visual information.”²³ The project was funded by the BBC and the European Commission.²⁴ A national disc contained interactive national statistics, photos, newspaper and magazine clippings, virtual reality tours, and movies. The community disc, or the ‘people’s database’ was compiled by nearly 1,000,000 people, contained four by three kilometer blocks of land with photos, data and text for 80 cities.²⁵ These multimedia data²⁶ were georeferenced to Ordnance Survey (OS) maps, airphotos and satellite images. The hardware consisted of a BBC microcomputer with floppy disk drives and a tracker-ball; Philips Laservision in Read Only Memory (ROM); a high-resolution colour monitor and a proprietary retrieval and analysis software.²⁷ It was an easy to use, information rich, interactive database driven multimedia second generation GIS. It also put state data into the public domain, stimulated much discussion about the emerging ‘information marketplace’ and the public versus the private sector’s rights to access public data.²⁸

Software and hardware, however, quickly became obsolete. In the late 1990s rescue and salvage work began and, just in time, as only a couple of fully operational systems were still operative. In 1999 a consortium under the name of CAMiLEON was formed to emulate the Domesday software into modern computers and between 2002-2003 they successfully did so. In 2001 a process to reverse engineer the

data began and by 2004, Adrian Pearce was able make them useable and accessible online.²⁹ And, in 2003 high quality copies of the original discs were made and the UK National Archives re-disseminated it.³⁰ Today the 1986 Domesday Project is available on the BBC *Domesday Reloaded*³¹ website while the content of the 1086 Domesday volumes is made available online with locations georeferenced with page citations using Google Maps in a project called the *Open Domesday*.³²

Both the 1960's Canada Land Inventory (CLI) and the 1986 Domesday Project were massive, expensive, national scale projects. They were technologically, scientifically and procedurally innovative marking a turning point in the history of computerization and science.³³ The CLI informed the creation of wildlife reserves, legislation to protect farmland, and were base maps in ecological frameworks which still in use today.³⁴ Both projects contributed to the geographical knowledge base of their respective nations and remain well-used, loved and important scientific records.³⁵ In both cases their data were inseparable from their software while the 1986 Domesday data could only be viewed with BBC proprietary hardware. Hardware, storage media, and software became obsolete and teams of dedicated people were able to restore these historical records and make them available to thousands of users today. These two examples illustrate the importance of considering long-term preservation at the point of creation by implementing good record keeping practices and to have a data management strategy in place as projects evolve.³⁶ Furthermore, they are arguments against the use of proprietary systems, and for the adoption of open specifications, standards and interoperability and for 'proactive archiving'.³⁷

²⁹ For the technical details on the rescue of the 1986 Domesday, see Darlington, Finney and Pearce (2003), "Domesday Redux."

³⁰ See the "Story of the Domesday Project," available on the *Domesday Reloaded* webpage at <http://www.bbc.co.uk/history/domesday/story> (accessed 20 August 2012).

³¹ The website is available at <http://www.bbc.co.uk/history/domesday/using-domesday> (accessed 20 August 2012).

³² *Open Domesday* is available at <http://domesdaymap.co.uk/> (accessed 20 August 2012).

³³ See R. J. Morris, "History and Computing: Expansion and Achievements," *Social Science Computer Review* 9, no. 2 (summer 1991): 215-230.

³⁴ The *Canada Encyclopedia* entry on the CLI provides describes of how it has contributed to the advancement of the Canadian economy and society, available at <http://www.thecanadianencyclopedia.com/articles/canada-land-inventory> (accessed 20 August 2012).

³⁵ There were 45,373 CLI map downloads in 2011-2012 and The Province of Ontario has a very popular CLI product available on this website <http://www.omafra.gov.on.ca/english/landuse/feed-in-tariffprogram.htm#3>, email communication received from Odette Trottier, Natural Resources Canada, Centre for topographic information on 28 August 2012.

³⁶ The InterPARES 2 Case Study on the *Cybercartographic Atlas of Antarctica* demonstrated that it is possible to design these aspects into systems at the point of creation, CS06 is available at http://www.interpares.org/ip2/ip2_case_studies.cfm?study=5. The IPY project mandated that all contributing scientists implement a data management strategy as part of funded projects see the Canada *IPY Data Management* at http://www.api-ipy.gc.ca/pg_IPYAPI_052-eng.html. Others have written about the technological issues of open source, standards and specifications, see Andrew Williamson, "Strategies for managing digital content formats," (2005) *Library Review* 54, no. 9: 508-513, and the Open Geospatial Consortium Data Preservation Working Group at <http://www.opengeospatial.org/projects/groups/preservdwg> (accessed 21 August 2012).

³⁷ In the case of cybercartographic atlases the use of open source, adherence to interoperable and open specifications, metadata as well as storing of multiple copies in geographically dispersed servers ensures ongoing backup future accessibility. See Peter Doorn and Heiko Tjalsma, "Introduction: archiving research data," *Archival Science* 7 (2007): 1-20, doi:10.1007/s10502-007-9054-6. Also, the IP2, CS06 *Cybercartographic Atlas of Antarctica* Case Study co-authored by Tracey P. Lauriault and Yvette Hackett (2005), available at http://www.interpares.org/ip2/ip2_case_studies.cfm?study=5 (accessed 18 August 2012).

3. Cybercartographic atlases as collective memory systems and community archives

While the CLI and the 1986 Domesday project exemplify the rescue and salvage efforts of legacy artefacts, there are countless examples of equally significant and technologically innovative digital maps and atlases currently being created that would be archived if a preservation infrastructure existed. The Geomatics and Cartographic Research Centre (GCRC) for instance has been actively engaged in the creation of cutting edge cybercartographic atlases for over a decade. Cybercartography “is the organization, presentation, analysis and communication of spatially referenced information on a wide variety of topics of interest and use to society in an interactive, dynamic, multimedia, multisensory and multidisciplinary format.”³⁸ Cybercartography also offers an unprecedented opportunity for fundamentally rethinking the way we design, produce, disseminate and use maps on the Internet, both theoretically and in practice.

The GCRC has been applying the concepts of cybercartography to map traditional knowledge in Canada’s north, traditional place names with indigenous heritage and educational institutions and geonarratives³⁹ surrounding treaty processes. These atlases embody the collective memories⁴⁰ of those who have contributed to their creation and have become a means to record the historical, geographical, cultural and scientific facts that have been transmitted orally for centuries. These atlases are the first official recordings of this aurally transmitted knowledge and elders and communities have authoritatively endorsed each record. The communities who have contributed to and authorized them regard these atlases as living archives.

The Inuit siku (sea ice) Atlas⁴¹ for example was developed to respond to Inuit elders’ and hunters’ expressions of interest: to share their knowledge with youth; see more Inuit knowledge and northern content in the northern education system and to share their knowledge more broadly with scientists and the general public. The SIKU Atlas was compiled and developed to reflect the knowledge, stories, maps, language, and lessons shared through years of interviews, focus groups, sea ice trips, and workshops with local sea ice experts in Cape Dorset, Igloolik, Pangnirtung, and Clyde River, Nunavut. Interactive atlas features are used to enable students to explore and learn about various sea ice topics, maps, Inuktitut terminology, community-specific information, and project background, including audio, video, pictures, text, and maps.

³⁸ See D. R. F. Taylor, Key Note Address titled “Maps and Mapping in the Information Era,” in *Proceedings 18th International Cartographic Conference*, vol. 1, ed. L. Ottomson Stockholm (Galve: Swedish Cartographic Society, 1997), 1-10; and *The Concept of Cybercartography*, Public Lecture University of Redlands and ESRI Staff. Redlands, (2003). CA, USA.

³⁹ See Sebastien Caquard, “Cartography I: Mapping Narrative Cartography,” *Progress in Human Geography*, November 7, 2011, doi:10.1177/0309132511423796.

⁴⁰ Anthea Josias describes a number of black South African collective memory projects capturing stories in text, audio and video; remaking district maps and communities documenting apartheid histories and the post-apartheid reconciliation processes. See “Toward an understanding of archives as a feature of collective memory,” *Archival Science*, vol. 11, (2011) pp. 95–112, doi:10.1007/s10502-011-9136-3. Elizabeth Nannelli discusses the Comissão de Acolhimento, Verdade e Reconciliação de Timor-Leste (Commission for Reception, Truth and Reconciliation, or CAVR) that recorded the testimonies of East Timorese living under Indonesian rule for 25 years between 1974 and 1999. See the “Records of the Commission for Reception, Truth, and Reconciliation in Timor-Leste,” *Archival Science* 9 (2009): 29-41, doi:10.1007/s10502-009-9103-4. Like cybercartographic atlases, these projects are making records outside of traditional archives and have become key references and the means to transfer knowledge by and for the communities that have created them. Only the CAVR is formally archived.

⁴¹ The Inuit siku (sea ice) Atlas (<http://sikuatlas.ca/>) was developed as part of an International Polar Year project called The Inuit Sea Ice Use and Occupancy Project (ISIUOP), through the collaboration of many northern, academic, government, and private industry contributors. It is a compilation of Inuit sea ice knowledge and use, as documented between 2004 – 2008; it is available at <http://sikuatlas.ca/index.html> (accessed 27 August 2012).

Figure 1. The Inuit Siku (sea ice) Atlas.

The Kitikmeot Heritage Society, Inuit Heritage Trust's Traditional Name Placing Project and the Gwich'in Cultural Society among others have approached the GCRC to help them map their place name databases with their collections of audio recordings of place names and video recordings of elders narrating the stories of those places. These place name atlases⁴² have become important knowledge transmission tools from elder to youth, are cultural geo-linguistic heritage preservation tools, have been incorporated as part of school curricula and are land occupancy records depicting the territorial extent of a community's land use and settlement. Naming places is part of the infrastructure of experience⁴³ and represents social relationships, kinship, historical events and shared cultural memories. These atlases are enabling local communities to replace their histories onto the map and others to see space from a different cultural lens.

The *Cybercartographic Atlas of the Lake Huron Treaty Relationship Process* (CALHTRP)⁴⁴ on the other hand is a retelling and re-mapping of the treaty process whereby historical archival records such as surveyor notebooks and diary entries, and numerous personal histories are geo-transcribed⁴⁵ and

⁴² See the *Kitikmeot Place Name Atlas* <http://www.kitikmeotheritage.ca/atlas.htm>, *The Arctic Bay Atlas* <http://arcticbayatlas.ca/index.html> (accessed 27 August 2012) and the *Gwich'in Goonanh'kak Goonwandak: The Places and Stories of the Gwich'in* (under development).

⁴³ See Paul Dourish and Genevieve Bell, "The Infrastructure of Experience and the Experience of Infrastructure: Meaning and Structure in Everyday Encounters with Space," *Environment and Planning B: Planning and Design* 34 (2005): 414 – 430.

⁴⁴ Available at <https://gcr.ca/confluence/display/GCRCWEB/The+Cybercartographic+Atlas+of+the+Lake+Huron+Treaty+Relationship+Process> (accessed 29 August 2012).

⁴⁵ Stephanie Pyne coined this term during the making of the *Cybercartographic Atlas of Indigenous Perspectives* in, "A "living Atlas" for Geospatial Storytelling: The Cybercartographic Atlas of Indigenous Perspectives and Knowledge of the Great Lakes Region," *Cartographica* 44, no. 2 (2009): 83-100.

Figure 2. Gwichin Place Name Atlas.

aggregated into a database. This database of stories is then mapped onto old and new maps along with georeferenced photographs, historical maps, signed treaties and the historical and archival records surrounding them. In addition, some historical maps were geo-rectified according to contemporary map projections⁴⁶ and layered with the oral history of events accounted by community elders or with the geo-transcribed stories from surveyor and explorer notes. These participatory and counter cartographies are enacting a post colonial mapping of Canada's treaty system. These atlases are therefore 'remapping' the official historical record by reflexively using western geospatial technologies, multimedia and methods in such a way so as not to recolonize.⁴⁷ Furthermore, they are also providing geonarratives to the making of colonial maps, making new records from old oral traditions, and by doing so put into question the 'authenticity' and 'completeness' of the traditional archival treaty record. Also, by geo-transcribing historical records, digitizing oral cultures, and re-purposing old maps in new ways, cybercartographic atlases are giving each of these records a 'secondary provenance',⁴⁸ even though the provenance of the

⁴⁶ Recently historical maps in the David Rumsey Map Collection have been geo-rectified to be viewed along in Google Map and Google Earth, available at <http://rumsey.geogara.com/gmaps.html> (accessed 29 August 2012).

⁴⁷ For a more detailed account of this process see Stephanie Pyne and D.R. Fraser Taylor, "Mapping Indigenous Perspectives in the Making of the Cybercartographic Atlas of the Lake Huron Treaty Relationships Process: A Performative Approach in a Reconciliation Context," *Cartographica* 47, no. 2 (2012): 92-104.

⁴⁸ Lori Podolsky Nordland in "The Concept of "Secondary Provenance": Re-interpreting Ac ko mok ki's Map as Evolving Text" discusses transmedia shifts of pre-Gutenberg archival records and how these digitized records gain new life and acquire new layers of meaning. Furthermore, in the case of the Ac ko mok ki' map, it was argued that it

Figure 3. Cybercartographic Atlas of the Lake Huron Treaty Relationship Process.

original record is provided, it becomes less important as the atlases allow for the re-interpretation of original records.

Aboriginal social memory or traditional knowledge is now being recognized in the courts for evidential purposes,⁴⁹ to countervail archival sources⁵⁰ and there is growing recognition that archival records such as treaties, maps and surveys were modernist legal devices of British and French colonialists. As Raymond Frogner noted, these records represented “sovereignty’s positivisation” and were legal fictions since they purported to have been created among equals,⁵¹ which was mostly not the case. The CALHTRP in particular, puts into question the ideas of treaties as dispositive documents as the transaction did not necessarily involve willful participants.⁵²

should be reinterpreted according to the Siksika world view and their cartographic conventions thus giving it a secondary provenance, *Archivaria* 58 (2004): 147-159.

⁴⁹ A famous Canadian example is the case of the Gitksan and Wet’suwet’en First Nations who used their oral histories, which capture their geo-histories in song, performances and stories in a land rights trial against the Province of British Columbia and the federal government. They also translated their traditional knowledge into a map. Furthermore, the plaintiffs, decided that to make their claim they “had to turn the legal system, its archives, precedents, and process against itself” as they recognized they were playing in a fixed game see p. 47 of Mathew Sparke, “A Map that Roared and an Original Atlas: Canada, Cartography and the Narration of Nation,” *Annals of the Association of American Geographers* 88, no. 3 (1998): 463-495.

⁵⁰ Raymond Frogner, in “Innocent Legal Fiction: Archival Convention and the North Saanich Treaty of 1852” demonstrated “that conventional archival interpretations identify the silences and discrepancies of the textual colonial record. But critics note that conventional archival method remains tied to its textual and sovereign paradigms. It does not address the often vague and uncertain relationship between the record and the manifold power structures, cultures, and traditions that surround the record’s formation and archival disposition,” *Archivaria* 70 (Fall 2010): 45.

⁵¹ Frogner, *Archivaria* 70 (Fall 2010): 47.

⁵² Oral histories surrounding the *North Saanich Treaty* are featured by Frogner (Fall 2010), pp. 81-86 and dispositive documents are discussed on p. 48.

In these three atlas examples Aboriginal elders and communities appraised the content of the maps; and also supplied, made and curated the records; and directed how these were to be cartographically rendered in collaboration with researchers and programmers at the GCRC. These atlases have become a community archive created outside the traditional archive with the use of ‘authoritative’ maps, methods and technologies, archival records, and by georeferencing traditional knowledge from ‘authoritative’ community sources onto new and old maps. In a sense they have put into question the authenticity of what ‘official’ archival documents about these spaces purport to be and have created a counter geo-narrative.

4. The Preservation of Geospatial Data

The Government of Canada has a number of ongoing geospatial data preservation strategies as seen in Table 1.⁵³ These thematic geospatial data archives are part of science-based departments and data are collected as part of the business function and reporting responsibilities of their custodial institutions. Also, these data are collected according to established scientific data methods that are deeply ingrained practices embedded into the tools from which data are sensed, how quality is assessed, and in how these data are organized, described, formatted, disseminated and used.⁵⁴ Of all the initiatives, only the Department of Fisheries and Oceans (DFO) archived data are part of a departmental science strategy. These archives are also collaborative endeavours which contain data accessioned in partnership with others, are collected as part of a cost-recovery arrangement with other institutions, are the holdings of partner institutions, are part of major collaborative research projects, are derived from sensors housed and managed in many institutions, or are derived from a myriad private and public sector satellite networks. All but the NSDB, which contains legacy datasets, include a combination of data from active and inactive sensors, which are continuously being updated, in many cases with near-real time data. They are therefore growing collections of data that have not necessarily been set aside for disposition purposes into a traditional archive and may remain part of ongoing business practices.

Many of the archives examined disseminate and allow for the visualization of their data using specialized software while none mention the preservation of software, hardware and associated specialized file formats. These initiatives may however not be archives in the traditional sense, because they are not “an agency or institution responsible for the preservation and communication of records selected for permanent preservation” or a “place where records selected for permanent preservation are kept.”⁵⁵ It is uncertain if the institutions within which the *Earth Observation Data Services (EODS)*, *The National Soil DataBase (NSDB)* or the *Integrated Science Data Management (ISDM) Wave Data Archive* housed respectively at NRCan, AAFC or DFO, have a data preservation policy in place together with the

⁵³ The following information forms part of a larger study commissioned by GeoConnections entitled *TA 2: Final Report: Geospatial Data Archiving and Preservation* as part of the Science & Technology Policy Research and Analysis Resource Team Prepared for: NRCan, GeoConnections Operational Framework Team by Hicklings, Arthur and Low (HAL), authored by Tracey P. Lauriault and Ed Kennedy, (March 2011).

⁵⁴ The IP2 Scientific Data Portal General Study discussed the specificities of disciplinary and sub-disciplinary scientific normative practices available at http://www.interpares.org/ip2/ip2_case_studies.cfm?study=34. Also see The Focus 2 – The Sciences section of Yvette Hackett, William Underwood, and Philip Eppard, “Part One: Case and General Studies in the Artistic, Scientific and Governmental Sectors Focus Task Force Report,” *InterPARES 2: Experiential, Interactive and Dynamic Records*, ed. Luciana Duranti and Randy Preston (2008), http://www.interpares.org/display_file.cfm?doc=ip2_book_part_1_focus_task_force.pdf (accessed 29 August 2012).

⁵⁵ Def. Archive: InterPARES 2 Terminology Dictionary, http://www.interpares.org/ip2/ip2_terminology_db.cfm.

necessary human and technological resources required to ensure the permanent preservation of these data and databases. These databases may simply be backed up. The cost recovery potential of the *EODS* data would warrant investment in a good storage, retrieval and backup system, while the *NSDB* could simply be a collection of agricultural data considered important by a group of dedicated soil scientists who have the skill and will to be their custodians. The *ISDM Wave Data Archive*, may be the closest to being a ‘traditional archive’ since DFO has a *Management Policy for Scientific Data*⁵⁶ that includes a mandate, model, infrastructure, and human resources dedicated to the archiving and preservation of their data resources. It is presumed that the DFO *IOS/OSD Data Archive* would fall under the same policy.

In terms of a preservation strategy,⁵⁷ these initiatives do share characteristic elements of a preservation repository, such as:

- The means to access the data and metadata;
- Reference and context information;
- Provenance information;
- Licensing and terms of use;
- File format information; and
- In some cases are created within a data management policy (e.g., DFO).

Most geospatial data portals that store and manage the data they disseminate (e.g., *GeoBase* and *GeoGratis*) have similar characteristics. It is harder to assess file transfer mechanisms, preservation strategies such as data migration, emulation, etc., file name conventions, unique identifiers, adherence to standard vocabularies, backup schedules and the technology used from their websites.

While imperfect in terms of a traditional archival perspective, these are nonetheless starting points to build a more comprehensive geospatial data and mapping preservation strategy. These however only represent but a very small fraction of the geospatial data produced at NRCan and the rest of the Government of Canada.⁵⁸ They are also examples of proactive archiving practices—some of which are inherent in geospatial data portals and of databases considered being part of a records management process.

5. Geospatial Data Management Models

The DFO Integrated Science Data Management⁵⁹ and the International Polar Year (IPY) Data and Information Service have developed data management models, which take into consideration preservation.

⁵⁶ DFO Management Policy for Scientific Data available, <http://www.dfo-mpo.gc.ca/science/data-donnees/policy-politique-eng.htm> (accessed 22 August 2012).

⁵⁷ Defined as “a coherent set of objectives and methods for protecting and maintaining (i.e., safeguarding authenticity and ensuring accessibility of) digital components and related information of acquired records over time, and for reproducing the related authentic records and/or archival aggregations,” in Def. Records Preservation Strategy: InterPARES 2 Terminology Database available at http://www.interpares.org/ip2/ip2_terminology_db.cfm.

⁵⁸ For a more detailed analysis of these initiative according to the 10 principles of digital preservation repositories developed by the Center for Research Libraries in Chicago see the HAL (2011) *TA 2: Final Report: Geospatial Data Archiving and Preservation*.

⁵⁹ DFO Integrated Science Data Management (ISDM), <http://www.meds-sdmm.dfo-mpo.gc.ca/isdm-gdsi/index-eng.html> (accessed 21 August 2012).

The *ISDM Wave Data Archive* (See Table 1) integrates the preservation and archiving of data from multiple organizations into an operational information management environment. The active field program of wave acquisition started in 1971, eventually discontinued in 1996, the process of submitting delayed-mode wave data has continued. In addition, ISDM acquires daily wave data from buoys operated by the Meteorological Service of Canada (MSC) at EC and manages scientific data from a wide range of sources and contains over 10 million hourly sea state and swell measurements from some 500 locations in Canada's lakes and surrounding oceans. While these data are being used in real-time to produce weather and sea state forecasts, its archiving program ensures that the information can be used in a variety of applications requiring data over long timeframes, such as hindcast models of wave climatology used in ocean maritime navigation, engineering and climate change studies.

Table 1. Government of Canada geospatial data preservation initiatives

IOS/OSD Data Archive , Department of Fisheries and Oceans (DFO)	National Climate Data and Information Archive , Environment Canada (EC)	Integrated Science Data Management (ISDM) Wave Data Archive , DFO

The National Soil DataBase (NSDB) , Agriculture and Agri- Food Canada (AAFC); Canadian Soil Information Service (CANSis)	Earth Observation Data Services (EODS) , Natural Resources Canada (NRCan), Canada Centre for Remote Sensing (CCRS)	National Water Data Archive , EC, Water Survey of Canada (WSC) w/Archived Sediment Data
Geomagnetism Summary Plots: Archives , NRCan, GSC	System of Agents for Forest Observation Research with Advanced Hierarchies (SAFORAH) , Canadian Forest Service (CFS), University of Victoria and other academic and government partners.	

The archiving and preservation commitment extends across all kinds of scientific data for which DFO is responsible, as evidenced by the department's *Management Policy for Scientific Data*,⁶⁰ which came into effect in June 2001. This IM Policy includes several references to the requirement for data archiving and preservation and it adheres to the following principles:

1. DFO scientific data sets... are irreplaceable, and must be protected and managed to ensure long-term availability;
2. ... it is essential that DFO Science/Oceans maintain responsibility for their quality control, management, archiving and dissemination; and
3. ... all scientific data collected by the DFO must be migrated to a 'managed' archive immediately after the data have been processed.

⁶⁰ DFO, *Management Policy for Scientific Data*, (2001), <http://www.dfo-mpo.gc.ca/science/data-donnees/policy-politique-eng.htm> (accessed 21 August 2012).

In terms of archiving, all DFO scientific data must be managed as part of an integrated system accessible through regional, zonal and national data centres and the responsibilities of the integrated system of data centres will be to:

- Ensure long-term accessibility and documentation in the event of organizational changes, retirements, etc.;
- Protect data against loss resulting from error, accident, technological change, degradation of media, etc.

When data are submitted, the DFO stresses the importance of ensuring that data are quickly migrated into a 'managed' environment where they are properly backed up and secured from accidental or circumstantial loss, and where the supporting metadata are integrated with the data to preserve their long-term usefulness. Finally the DFO includes a data rescue program to locate and preserve scientific data that are of value to departmental programs and to identify data at risk.

The International Polar Year (IPY) project, on the other hand, was a large three-year Arctic and Antarctic scientific program, organized through the International Council for Science (ICSU) and the World Meteorological Organization (WMO). The IPY Data and Information Service (IPYDIS)⁶¹ was a global partnership of data centers, archives, and networks working to ensure the proper stewardship of IPY and related data. The National Snow and Ice Data Center (NSIDC) at the University of Colorado is a coordination office for the IPYDIS and it ensures the long-term preservation and access to IPY data. The policy⁶² states that:

...it is essential to ensure long-term preservation and sustained access to IPY data. All IPY data must be archived in their simplest, useful form and be accompanied by a complete metadata description. An IPY Data and Information Service (IPYDIS) should help projects identify appropriate long-term archives and data centers, but it is the responsibility of individual IPY projects to make arrangements with long-term archives to ensure the preservation of their data. It must be recognized that data preservation and access should not be afterthoughts and need to be considered while data collection plans are developed.

The IPY exemplifies a distributed or "virtual" archive of scientific data and proactive archiving. The Service's Web site guides digital scientific data users to a number of portals and centers that are currently providing access to IPY and related data and all data registries and repositories are required to adhere to the IPY Metadata Profile requirements. This profile was based on the Global Change Master Directory (GCMD) Directory Interchange Format, and is compliant with and has been mapped to recognized geospatial metadata standards.⁶³

⁶¹ IPY, *International Polar Year Data and Information Service (IPYDIS)*, Ironically the IPYDIS site is not longer supported but copies of key documents are available from Mark A. Parsons at parsonsm@nsidc.org.

⁶² IPY, (2008), *International Polar Year 2007-2008 Data Policy* is available at http://classic.ipy.org/Subcommittees/final_ipy_data_policy.pdf (accessed 21 August 2012).

⁶³ The standards are: Global Change Master Directory (GCMD) Directory Interchange Format (DIF); the Federal Geographic Data Committee (FGDC) Content Standard for Digital Geospatial Metadata (CSDGM) (FGDC-STD-001-1998) and Remote Sensing Extensions (RSE) (FGDC-STD-012-2002); and THREDDS Dataset Inventory Catalog Specification Version 1.0. Other international standards are recommended such as the Open Geospatial Consortium (OGC) standards, and the ISO 19115:2003 metadata standard. See IPY Data and Information Management Service, *IPY Metadata Profile version 1.0*, available from Mark A. Parsons parsonsm@nsidc.org.

The DFO and IPY policies, practices and initiatives, like the archiving examples just discussed above, are good places to start when planning a strategy to preserve geospatial data and maps.

6. Canadian digital data and information consultations, studies, reports and initiatives

The above-mentioned geospatial data archives and data management models occurred in spite of the paucity of tangible outcomes from the 12 consultations, studies, reports and initiatives as seen in figure 4 below.

The *Research Data Strategy*⁶⁴ is one of the tangible outcomes of the 2002 *NCSARD* report process that will be discussed shortly. It is a collaborative effort between government and academia aiming to address the challenges and issues surrounding access to and preservation of data created by Canadian researchers. It is a multidisciplinary group of universities, institutes, libraries, granting agencies, and individual researchers, including several officials involved with the creation, management, dissemination and/or funding of geospatial data,⁶⁵ who recognize the need to address data management issues. While the focus is on research data, the ideas are transferable to the preservation and management of geospatial data. The approach and principles to data stewardship recommended by *Research Data Canada* have been echoed in many other initiatives discussed here, namely that data stewardship and management needs to be framed in a life cycle model at all stages of the data production process and making data

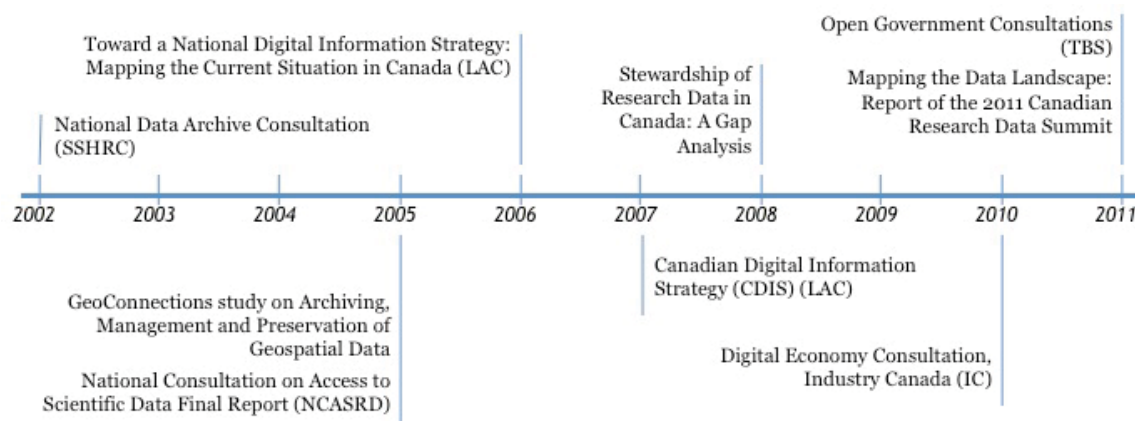

Figure 4. Canadian Digital Data and Information Consultations, Studies, Reports and Initiatives.

preservation a formal institutional responsibility.⁶⁶

Two international groups hold potential for future guidance in geospatial data archiving and preservation. The Committee on Data for Science and Technology (*CODATA*) *Working Group on*

⁶⁴ Available at the Research Data Strategy home page, <http://rds-sdr.cisti-icist.nrc-cnrc.gc.ca/eng/> (accessed 27 August 2012).

⁶⁵ John Broome, the Chair CNC/CODATA and Head, Data Management Policy and Strategy, Earth Sciences Sector, Natural Resources Canada; Scott Tomlinson, Data Management Coordinator, International Polar Year Federal Program and Chuck Humphrey, Data Library Coordinator, Libraries, University of Alberta.

⁶⁶ Research Data Canada, <http://ncasrd-cnads.scitech.gc.ca/eng/about/principles-data-stewardship.html>.

*Archiving Scientific Data*⁶⁷ has been holding symposia and workshops on the topic and the *Canadian National Committee for CODATA*⁶⁸ has been active in documenting and reporting scientific data activities. Members of these include geospatial data experts. The Open Geospatial Consortium (OGC) also has a *Data Preservation WG*,⁶⁹ which aims “to address technical and institutional challenges posed by data preservation, to interface with other OGC working groups that address technical areas that are affected by the data preservation problem, and to engage in outreach and communication with the preservation and archival information community.” Reports from this WG are not yet available.

In terms of consultation, only the 2011 TBS *Open Government Consultations*⁷⁰ yielded a report that informed an actual plan⁷¹ that was released at the Open Government Partnership in Brazil⁷² in the spring of 2012. The plan includes better record keeping and the lifting of restrictions to archived material at LAC but it does not include the preservation of data in the TBS *Open Data Pilot Project* portal nor any kind of preservation strategy for maps and data produced by government more broadly. The TBS Consultation report and the Plan also make no reference to preservation and archiving, LAC was not one of the ‘thought leaders’ to make a public submission and the complete list of individuals and organizations who submitted has not been made public.⁷³ Furthermore, the Advisory Panel on Open Government⁷⁴ does not include a representative from LAC, libraries, archives or science although the President and Founder of ESRI Canada is a member. Interestingly, the most popularly requested datasets in the TBS Consultation were geospatial and geospatial datasets predominate in terms of number of datasets in the *Open Data Pilot Project* portal.⁷⁵

The *Mapping the Data Landscape: Report of the 2011 Canadian Research Data Summit*⁷⁶ was the result of National Research Council (NRC) of Canada 2011 Canadian Research Data Summit held in September of 2011 and summit partners included Canadian IPY members.⁷⁷ The report is currently being circulated to discuss the *Research Data Strategy*.

The 2010 IC *Digital Economy Consultation*⁷⁸ did not result in any consolidated report or actions. The IC *Consultation Paper*⁷⁹ circulated to frame the consultation, however, did mention improving access

⁷⁵ When the *Open Data Pilot Project* portal was launched, IASSIST reported that there were “782 general datasets (e.g., not geospatial) and over 260,000 geospatial datasets” available at <http://www.iassistdata.org/resources/canadas-open-data-pilot-project> (accessed 26 June 2011).

⁷⁶ The report is available at rds-sdr.cisti-icist.nrc-cnrc.gc.ca/docs/data_summit-sommet_donnees/Data_Summit_Report.pdf (accessed 27 August 2012).

⁷⁷ See the report background material available at http://rds-sdr.cisti-icist.nrc-cnrc.gc.ca/eng/events/data_summit_2011/index.html (accessed 28 August 2012).

⁷⁸ Industry Canada, (2010), *Digital Economy Consultation*, available at http://www.digitaleconomy.gc.ca/eic/site/028.nsf/eng/h_00491.html (accessed 27 August 2012).

to research data, data discovery and open access publishing but did not explicitly mention the geomatics sector or geospatial data. A cursory examination of submissions and the idea forum⁸⁰ called for the creation of a digital data and information archive and a network of trusted digital repositories.⁸¹ The summary of key findings⁸² however failed to mention these calls.

The *Stewardship of Research Data in Canada: A Gap Analysis*⁸³ was conducted by members of *Research Data Canada*. The life-cycle model was used as the framework to analyse the current state of research data stewardship in Canada, which includes: data production, dissemination, long-term preservation and data discovery and repurposing. The *Gap Analysis* reviewed: policies; funding; roles and responsibilities; repositories; standards; skill and training; rewards and recognition systems; R&D; access; and preservation. Not surprisingly, the analysis concluded that most research data created in Canada are greatly underutilized and are at a high risk of being lost. Geospatial and research data share similar characteristics, namely: they are complex, are in multiple data formats, use non standardized rendering techniques and specialized open and/or proprietary software, are disseminated in portals, or are shared and visualized in distributed systems, datasets can be very large and data can be modeled. Geospatial initiatives, unlike research data do have uniform metadata and data quality standards are normalized.

The 2007 LAC *Canadian Digital Information Strategy (CDIS)*⁸⁴ report reflects the broad consensus reached at a *National Summit*⁸⁵ held in 2006 which included contributions from more than 200 specialists some of whom are involved in geospatial data creation, use, dissemination and management. There are numerous suggested actions listed, none of which are specific to geospatial data, although GeoConnections, GeoGratis, the Canada Ice Service Data Archive and GeoBase are lauded for some of their initiatives. Environment Canada, Statistics Canada, DFO and NRCan are mentioned as institutions that produce and hold significant collections of government data. Some of the preservation assumptions upon which the *CDIS* was premised mirror contemporary geospatial data productions practices and issues. For example: technological change is constant; a distributed, interoperable, standards based, open and

⁸⁵ Library and Archives Canada (2006), *Toward a Canadian Digital Information Strategy: National Summit*, accessed February 2011 <http://www.collectionscanada.gc.ca/obj/012033/f2/012033-611-e.pdf>.

accessible strategy is key; stakeholders and communities of practice input are essential. The proposed actions could be incorporated into existing Government of Canada data portals.

The LAC 2006 *Toward a National Digital Information Strategy: Mapping the Current Situation in Canada*⁸⁶ states that “the stewardship of digital information produced in Canada is disparate and uncoordinated” and “the volume, diversity and complexity of digital information is growing exponentially” while the “technologies, standards and practices that will better ensure the ongoing accessibility and integrity of digital information are not yet consistently applied.” The report includes a brief description of the GeoConnections program and lists a number of other geospatial data initiatives at different levels of government in Canada in its Annexes. The report does not provide specific recommendations on how to manage these resources but it does suggest that the:

...preservation of digital information requires a management response, not just a technological response. The response must be active and sustained through time and it must address the preservation of digital information from both the strategic and tactical perspectives and within the context of the management frameworks that govern the businesses of organizations themselves. It must also be comprehensive and address all facets of the required preservation infrastructure: the policies that assign accountability, the standards, practices, procedures and technologies that enable the implementation of preservation strategies, and the people that make it all happen. These issues present a tremendous challenge and must be addressed in an inclusive and collaborative manner.⁸⁷

MacDonald and Shearer also provide a number of next steps toward the creation of a national digital information strategy, which resemble the collaborative strategies used to create the CGDI (e.g., multisectoral, departmental and multidisciplinary collaboration, etc.).

In 2005 GeoConnections conducted a study on *Archiving, Management and Preservation of Geospatial Data*⁸⁸ which provided a well rounded analysis of geospatial data preservation issues, such as: technological obsolescence; formats; storage technologies; temporal management; and metadata.⁸⁹ The study also provided a list of technological preservation solutions with their associated advantages and disadvantages and recommended “as the first step in ensuring the long-term preservation and retention of valuable resources, data producers must adopt an information life cycle management approach, which will ensure that their data will be managed proactively from creation to disposition.”⁹⁰ The recommendations are somewhat outdated in light of institutional changes at NRCan and of the new TBS Directives and Guidelines, irrespective, the study provides the following useful recommendations:

⁸⁶ MacDonald, J. and K. Shearer (2006), *Toward a National Digital Information Strategy: Mapping the Current Situation in Canada* (Ottawa: Library and Archives Canada), accessed February 2011 Summary: <http://www.lac-bac.gc.ca/digital-initiatives/012018-3200-e.html> and full Final Report: <http://www.collectionscanada.gc.ca/obj/012018/f2/012018-3200-e.pdf> (accessed 29 August 2012).

⁸⁹ The approach adopts the framework created by Bleakly, Denise R. (2002). *Long-Term Spatial Data Preservation and Archiving: What are the Issues?* Sand Report, SAND 2002-0107. Albuquerque, New Mexico: Sandia National Laboratories available at <http://prod.sandia.gov/techlib/access-control.cgi/2002/020107.pdf> (accessed 28 August 2012).

⁹⁰ GeoConnections (2005), *Archiving, Management and Preservation of Geospatial Data*, Page i.

- Organizations should define and implement policies and practices for the creation, use, retention, dissemination, preservation, and disposition of geospatial data. Building a business case for the creation of core geospatial data products is suggested.
- Organizations must establish authoritative responsibility centers that empower individuals with the ability to define and apply the information management principles required to ensure the integrity of an organization's geospatial data holdings. A custodianship model is an option, which provide a means to facilitate data management on the behalf of creators and users, and provide continuity in the delivery of a geospatial data infrastructure.
- Geospatial data preservation issues fall within the realm of a national information policy, and a national data management strategy. Working in partnership with the library and archives communities, government data producers need to standardize and adopt organizational policies and practices to govern the creation, use, retention, dissemination, preservation, and disposition of geospatial data to ensure its authenticity and integrity for as long as it is required for legislation, departmental statutes and other laws and policies. Key geospatial advisory boards, councils, and standards organizations should work with LAC to develop a series of geospatial data policies and practice.
- The Canadian Council on Geomatics (CCOG) should create a task force and invite interested stakeholders from the academic community, private sector and other federal and provincial/territorial agencies that can collaborate to develop priority policy areas identified above.

The 2005 *National Consultation on Access to Scientific Data Final Report (NCASRD)*,⁹¹ developed in partnership with the NRC, the Canada Foundation for Innovation (CFI), Canadian Institutes of Health Research and Natural Sciences and Engineering Research Council (NSERC), expressed the concern that: “no national data preservation organization exists, nor does Canada have any national data access strategy or policies. NCASRD participants expressed considerable concern about the loss of data, both as national assets and definitive longitudinal baselines for the measurement of changes over time.”⁹² The *NCSARD* report provides a comprehensive list of recommendations that include organizing a Data Force and the creation of a Data Canada secretariat.

The 2002 *SSHRC National Data Archive Consultation*⁹³ is *NSCARD*'s predecessor, primarily discusses data in the social sciences and humanities and the preservation of data created in the course of state funded research projects. The *Consultation* identified important institutions, infrastructures, management frameworks and data creators and calls for the creation of a national research data archive.

To date not much has happened in terms of implementation. Currently, LAC does not have a digital geospatial data archive and there is no national network of trusted digital repositories with the explicit mandate to ingest geospatial data, research, government or private sector created data. In light of recent budget cuts at LAC, proactive archiving and records management might be the best interim solution.

7. Legislation, Directives and Policies

It is beyond the scope of this paper to discuss all applicable legislation, directives and policies. Tables 2 and 3 list the overarching legislation, regulation, directives and policies which apply to geospatial data and Table 4 includes NRCan legislation that explicitly mention geospatial data, maps, note books, surveys or software that are to be preserved or are considered to be official government records. For a more detailed analyses of these please refer to the 2011 *TA 2: Final Report: Geospatial Data Archiving and Preservation*.

The Library and Archives Act (Table 2) is specific to LAC, while the others direct how Government of Canada information is to be managed and disseminated irrespective of the creating institution. These acts and regulations govern the preservation, management and dissemination of geospatial data, databases and maps, which, irrespective of their form are government information. These acts and regulations provide the context within which TBS and departmental guidelines, directives, and policies related to the management of government information are created.

Table 2. Overarching legislation and regulation that apply to geospatial data.

The Library and Archives of Canada Act (2004, c. 11)	Personal Information Protection and Electronic Documents Act (2000, c. 5)
<i>Copyright Act</i> (R.S., 1985, c. C-42)	Canada Evidence Act (R.S., 1985, c. C-5)
Access to Information Act (R.S., 1985, c. A-1)	Legal Deposit of Publications Regulations (SOR/2006-337)
<i>Privacy Act</i> (R.S., 1985, c. P-21)	Privacy Regulations (SOR/83-508).

Table 3 lists information management policies, directives, guidelines and standards at the federal level in Canada related to data archiving preservation in general and some refer to geospatial information specifically. The primary responsibility for such policies lies with the TBS. The *Standard on Geospatial Data* is the only document that addresses geospatial information domain. Its objective is “to support stewardship and interoperability of information by ensuring that departments access, use and share geospatial data efficiently and effectively to support program and service delivery.” It does not explicitly reference digital information archiving and preservation, although there is a linkage between it and LAC’s *File Format Guidelines for Preservation and Long-term Access*,⁹⁴ which recommends geospatial metadata standards for the preservation of and long-term access to digital geospatial information held by government organizations.

⁹⁴ Library and Archives Canada, *File Format Guidelines for Preservation and Long-term Access*, available at <http://www.collectionscanada.gc.ca/digital-initiatives/012018-2200-e.html> accessed March 2011

Table 3. Information policies, guidelines and standards.

TBS Directive on Recordkeeping ⁹⁵	Policy on Management of Information Technology ⁹⁶
TBS Directive on Information Management Roles and Responsibilities ⁹⁷	TBS Multi-Institutional Disposition Authority (MIDA) ⁹⁸
TBS Standard for Electronic Documents and Records Management Solutions (EDRMS) ⁹⁹	LAC Guidelines: Local Digital Format Registry (LDFR) ¹⁰⁰
TBS Policy on Information Management ¹⁰¹	TBS Standard on Geospatial Data ¹⁰²
TBS Policy Framework for Information and Technology ¹⁰³	TBS Standard on Metadata ¹⁰⁴
Forthcoming Methodology associated with TBS Directive on Recordkeeping, which NRCan Records Management Group contributed.	

Table 4 lists acts and regulations that specifically address geospatial information and are under the responsibility of the Minister of Natural Resources.¹⁰⁵ The *Remote Sensing Space Systems Act* and the *Remote Sensing Space Systems Regulations* were added since they impact how the Canada Centre for Remote Sensing (CCRS) manages its geospatial data sets, while the *Charts and Nautical Publications Regulations* addresses marine geospatial information. Acts and regulation mention raw data, how these are to be processed, the systems used to view and process the data and the use of cryptography. There are also mentions of registrars and catalogs. In some there are specific references to archiving, deposition, data protection plans, the number of years data are to be kept and data curation. Finally, because these geospatial datasets are critical to the management of Canada's boundaries, the health and safety of Canadians, Canada's economy and the attestation of lands, these government records can all be called into evidence to resolve international and national disputes, or any other judicial proceeding. Clearly, the geospatial datasets mentioned here must be well managed once they are created and should be preserved accordingly. The Government of Canada produces geospatial data, databases and maps in many other

¹⁰⁴ Treasury Board of Canada Secretariat, (2010), *Standard on Metadata*, <http://www.tbs-sct.gc.ca/pol/doc-eng.aspx?id=18909§ion=text> (accessed 29 August 2011).

¹⁰⁵ Natural Resources Canada, (modified 2010), *List of acts for which the Minister of Natural Resources is responsible*, <http://www.nrcan-rncan.gc.ca/com/resoress/actacte-eng.php>, (accessed 29 August 2012).

departments and agencies and each of these would have to adhere to acts and regulations for which they are responsible along with those in Tables 2 and 3.

Table 4. Acts and regulation governing geospatial data.

Department of Natural Resources Act (1994, c. 41)	Energy Monitoring Act (R.S., 1985, c. E-8)
Resources and Technical Surveys Act (R.S., 1985, c. R-7)	National Energy Board Act (R.S., 1985, c. N-7) and National Energy Board Electricity Regulations (SOR/97-130)
Canada Lands Surveys Act (R.S., 1985, c. L-6)	Northern Pipeline Act (R.S., 1985, c. N-26)
Forestry Act (R.S., 1985, c. F-30) and Regulations Respecting the Report on the State of Canada's Forests (SOR/95-479)	Nuclear Energy Act (R.S., 1985, c. A-16)
Canada Oil and Gas Operations Act (R.S., 1985, c. O-7) and Canada Oil and Gas Geophysical Operations Regulations (SOR/96-117)	Nuclear Fuel Waste Act (2002, c. 23)
Canada Petroleum Resources Act (1985, c. 36 (2 nd Supp.))	Nuclear Safety and Control Act (1997, c. 9)
Canada-Newfoundland Atlantic Accord Implementation Act (1987, c. 3)	Uranium Mines and Mills Regulations (SOR/2000-206)
Canada-Nova Scotia Offshore Petroleum Resources Accord Implementation Act (1988, c. 28)	Remote Sensing Space Systems Act (2005, c. 45) and Remote Sensing Space Systems Regulations (SOR/2007-66)
Energy Efficiency Act (1992, c. 36)	Charts and Nautical Publications Regulations (SOR/95-149)

The legislation reviewed in the HAL 2011 Report, demonstrated the diversity of types of geospatial data and maps, their forms, formats and associated software and systems, how they are managed, the context within which they are created, and how they are considered authentic. Also, many geospatial datasets are very highly regulated. This analysis, combined with an examination of data IP2 science data portals below, reaffirms the heterogeneous nature of geospatial data and maps and the importance of creators to be involved in the process of preserving geospatial data assets.

8. LAC Guidelines pertaining to Geospatial Data and Maps

Few LAC guidelines apply to cartographic material. The 2011 *Managing Cartographic, Architectural and Engineering Records in the Government of Canada*¹⁰⁶ mentions that geomatics records include systems, discs, CD-ROMs and other cartographic material in electronic formats. However, it refers to the

¹⁰⁶ Library and Archives Canada (LAC), *Managing Cartographic, Architectural and Engineering Records in the Government of Canada*, Ottawa: Government of Canada, <http://www.collectionscanada.gc.ca/government/002/007002-2050-e.html> (accessed 29 August 2012).

2001 Canadian Committee on Archival Description (CCAD) *Rules for Archival Description Chapter 5*,¹⁰⁷ which primarily address paper maps although general issues pertaining to digital databases and programs are covered in the 2003 *Chapter 9: Records in Electronic Form*.¹⁰⁸ The LAC Local Digital Format Registry (LDFR) *File Format Guidelines for Preservation and Long-term Access Version 1.0*¹⁰⁹ includes *Geospatial* guidelines and recommends TC 211 ISO 19115 Geographic Information—Metadata and input from digital geospatial data record creators and managers is solicited. These guidelines are, however, inadequate for the kind of complex geospatial artefacts discussed in InterPARES 2 Project (IP2) or for cybercartographic atlases.

9. Research on the preservation of geospatial data in Canada

The following discusses empirical examples from a selection of InterPARES 2 Project¹¹⁰ Case Studies¹¹¹ (Table 5) that study geospatial data, and part of the IP2 General Study 10 (GS10),¹¹² which examined geospatial data portals (Table 6).

The IP2 Case Studies in Table 5 below include observational data in a variety of forms, while five also included computational data or models. All but the Cybercartographic Atlas¹¹³ render or store their data in a proprietary system, and data are stored in a variety of databases or in a searchable data portal while Engineering project data¹¹⁴ (CS19), the Land Registry¹¹⁵ (CS18), and some of the NASA data (CS08) are inseparable from the systems within which they have been created and/or stored. As discussed earlier when examining the CLI and the 1986 Domesday project, these findings are somewhat discouraging.

The IP2 Case Study questions regarding authenticity¹¹⁶ revealed that the prevalent concept of reliability is closely tied to reproducibility and accuracy in the physical sciences. In many cases, reliability is associated with faith in the technological systems in place or security measures related to access to the system. In terms of authenticity, it was revealed that Case Study respondents¹¹⁷ do not think

¹¹⁴ Kenneth Hawkins, *CS19 Authenticating Engineering Objects for Digital Preservation* (Vancouver, 2005).

¹¹⁵ Jean-François Blanchette, Françoise Banat-Berger and Geneviève Shepherd, *CS18 Computerization of Alsace-Moselle's Land Registry* (Vancouver, 2004).

¹¹⁶ See Table 1: Authenticity Statements in the supplementary file on the IP website at http://www.interpares.org/display_file.cfm?doc=Archivaria64_Todays_Data_supplementary_tables.pdf (accessed 29 August 2012).

¹¹⁷ Trust in data sources was found to be important in both the Cybercartographic Atlas of Antarctica (CS06) and the Archeology records study (CS14), while technological integrity, validity procedures and system checks were implemented in the Mars Global Surveyor Data Study (CS08), the Computerization of Alsace-Moselle's Land Registry (CS18) and the Most Satellite Mission project (CS26). Some of the studies controlled access to their datasets via the appointment of responsible agents (VanMap and the Alsace-Moselle Land Registry), or specialists (Cybercartographic Atlas), while peer

of authenticity in the same way that archivists do, as the emphasis leans more towards measures to ensure data quality. The Land Registry (CS18) may be the exception, as the system is specifically designed to ensure that each registration is authenticated in the system.

Table 5. InterPARES 2 Geospatial Data Case Studies.

Case Study Title	Description	Observational Data	Computational Data
<i>CS06 - Cybercartographic Atlas of Antarctica</i>	Online interactive and dynamic, open standards, interoperable multimedia, multisensory, multimodal atlas that renders distributed data from myriad scientific organizations.	Distributed observational data from myriad sources in real time, film, satellite images, tabular data, sounds, etc.	Data are rendered /refined into maps, charts, tables by the Nunaliit Atlas Framework
<i>CS08 - Mars Global Surveyor Data Records in the Planetary Data System</i>	Surveyor mission data records at the Planetary Data System (PDS) Space Science Data Archive.	Level 0 and refined planetary spacecraft mission data stored in a database with attributes and metadata	Software used to access or visualize the data
<i>CS14 - Coalescent Communities in Arizona</i>	Archaeological Records of the American Southwest rendered in a GIS.	Tabulated raw data collected from archaeological digs	Raw data are rendered/refined into maps
<i>CS18 - Computerization of Alsace-Moselle's Land Registry</i>	Electronic registry including digital transcription of 40 000 existing paper registries and new database entries individually signed by a judge using a PKI infrastructure combining biometric access and digital signatures.	Database of digitized paper land registries and attributes	Data and their attributes are accessed via a data base using PKI technology
<i>CS19 - Authenticating Engineering Objects for Digital Preservation</i>	Examines through an engineering experiment the authentication of digital model (CAD) records using a content/message/semantic-based methodology rather than media, bit-count, or static provenancial attribute-based authentication.	CAD solid model files used in the design and manufacturing of mechanical piece-part assemblies	The files are rendered and stored in a proprietary system
<i>CS24 - City of Vancouver Geographic Information System (VanMap)</i>	An enterprise web-based map system maintained by the City of Vancouver's Information Technology Department.	Land use, social statistics, city infrastructure data both internally collected and acquired from external sources etc.	Enterprise GIS renders data into maps, charts, and tables etc.
<i>CS26 – MOST Satellite Mission: Preservation of Space Telescope Data</i>	Repository of the Microvariability & Oscillations of Stars satellite mission data of Canada's first space telescope.	Raw satellite data and their refined counterparts	

review of data was a method used in the Mars Global Surveyor Data study (CS08). In the Engineering Objects Study (CS19), the creators did not believe their records to be authentic as they have no assurance system.

Portals, it was discovered during the IP2 science case studies, provide a framework within which geospatial data archivists can work and from which they can expand with policies, standards and metadata. Especially since, data producers and users have already appraised the data these contain or refer to as being valuable enough to be paid for, collected, described, licensed, endorsed, organized and disseminated. Also, geospatial data are increasingly being discovered and accessed via data portals. Portals make it possible for users to “gather data germane to their own needs more readily, extract data from online and other electronic repositories, develop the information product they need, use the products for decision making, and contribute their locally gathered geoinformation and derived products to libraries or other repositories.”¹¹⁸

As is commonly known in the field of geomatics, portals can provide all or some of the following services: search and retrieval of data; item descriptions; display services; data processing; the platform to share models and simulations; and the collection and maintenance of data. Much but not all of the data derived from portals are raw in nature and require the user to interpret, analyse and/or manipulate them while the reasons for portal creation are one-stop-shopping, distributed responsibility over data sets, discoverability, and reduction in cost as data are stored or described once and used many times.¹¹⁹

Furthermore, portals are the technical embodiment of data-sharing policies. Individuals within organizations, research projects, or scientific collaborations register their data holdings in portals via an online form organized according to a metadata standard, and then choose to make their data available for free or for sale, viewing or downloading.¹²⁰ Metadata standards “establish the terms and definitions to provide a consistent means to describe the quality and characteristics of geospatial data,”¹²¹ and the ISO 19115 metadata¹²² standard has become an international standard in the field of geomatics as have those mentioned earlier in the case of the IPY. Most of the portals examined in IP2’s General Study 10 include either very detailed metadata or rudimentary header information that contains lineage information.¹²³

The architecture of data portals varies¹²⁴ and portals can be a single enterprise sponsored portal (like a national library), a network of enterprises (like a federation of libraries) or a loose network connected by protocols (like the Web). Distributed data portals have datasets described according to a given standard, and when a request is sent to them by a given site a search is executed by a search agent¹²⁵ to access or render the data into a map or some other form. Many maps and atlases for example, adhere to interoperable OGC standards and specifications, which allow for distributed mapping. In the case of *Cybercartographic Atlas of Antarctica*, for example, users access a module and a call is made to the British Antarctic Survey data portal in the United Kingdom and these are then rendered into a map in real time by the Atlas Framework in Ottawa and delivered directly to the user’s computer. Other examples of

¹²⁵ National Research Council (1999).

this type of portal are those, which use Web mapping services, such as the British Antarctic Survey. The GeoConnections Discovery Portal (IP2SF15) is an example of this type of portal. Data portals can be housed in a single physical location (e.g., Statistics Canada), and they may be virtual, housed in a set of physical locations and linked electronically to create a single, coherent collection (e.g., GCMD, International Comprehensive Ocean Atmospheric Dataset). The distinction between centralized, distributed or unified portals may have funding, policy and preservation implications.

There are three functional data collections/portal categories¹²⁶ such as 1) research data collections; 2) resource or community data collections; and 3) reference data collections, and each have sets of characteristics that affect the type of data they contain, data contributors, funding and institutional arrangements and the kind of preservation strategies that may apply.

The GS10 portals provided a rich array of information on the topic of authenticity. Ensuring that data are of good quality and can be trusted is critical to these data portals, or else users would not rely on them. For many of the portals, the process of data control begins at the time the data are ingested into the system, made accessible via Web server sharing protocols, or described in a metadata description form. Some portals only ingest data that are derived from peer review journals; others restrict who can access the portal and contribute data.

Once data are in a particular portal, there are a wide variety of security measures in place to ensure they are not tampered with. Before data are made available, most have validation processes in place to attest to their authenticity and quality. However, there did not seem to be any mechanisms for users to assess if the datasets they downloaded or received are authentic beyond metadata and file headers. Also, the concept of the presumption of authenticity defined as “an inference as to the fact of a record’s authenticity that is drawn from known facts about the manner in which that record has been created and maintained”¹²⁷ is a useful one as the context, practices, associated documentation, validation processes and authentication, and access measures would suggest that the Case Studies discussed and portals discussed here are presumed authentic from an archival perspective.

Table 6. General Study 10 Geospatial Data Portals

Portal Title	Description
Canadian Geospatial Data Infrastructure (CGDI) Access Portal	Geospatial data such as DEM, orthophotos, air photos, satellite and radar imagery, data Services, discovery metadata, documents, Internet Maps, and Atlases.
Statistics Canada	Under the Statistics Act Statistics Canada is required to collect, compile, analyse, abstract and publish statistical information relating to the commercial, industrial, financial, social, economic and general activities and conditions of the people of Canada.
Long-term Ecological Research (LTER)	Data of Holocene barrier island geology; salt marsh ecology, geology, and hydrology; ecology/evolution of insular vertebrates; primary/secondary succession; life-form modeling of succession; online maps, photos, webcams; physical; biological, images and geographic data, software, LTER Network Data; and models.

¹²⁶ For detailed descriptions of these see the American Institute of Physics (AIP), 2001, *AIP Study of Multi-Institutional Collaborations: Final Report. Highlights and Project Documentations* Melville, accessed March 2011, <http://www.aip.org/history/publications.html> and National Science Foundation, 2005, *Report of the National Science Board*, p. 20. The GS10 Report describes this more thoroughly and includes portal examples.

¹²⁷ InterPARES 2, *Terminology and Glossary*, http://interpares.org/ip2/ip2_terminology_db.cfm.

Southern California Earthquake Center (SCEC)	Data sets include seismic waveforms, mostly passive source seismic data collected by broadband, strong-motion and analogue instruments. LARSE I and II seismic survey, data sets from the portable deployments following the Landers and Northridge earthquakes, and data from the Anza network and SCEC borehole stations. Non-seismic data includes “survey-mode” precise GPS measurements made in southern California by various universities. The GPS data archive consists of raw GPS data, RINEX files, indices to the RINEX files, log sheets and site descriptions.
International Comprehensive Ocean Atmosphere Data Set (ICOADS)	Surface marine reports from ships, buoys, and other platform types. Each report contains individual observations of meteorological and oceanographic variables, such as sea surface and air temperatures, wind, pressure, humidity, and cloudiness; monthly summary statistics.
National Geophysical Data Center (NGDC - NOAA)	Geophysical data describing the solid earth, marine, and solar-terrestrial environment, as well as earth observations from space.
Antarctic Digital Database (ADD)	1:200,000/1:250,000 maps and collaborative topographic database compiled from a variety of Antarctic map and satellite image sources.
National Snow and Ice Data Center (NSIDC), NASA	Snow, ice and glaciological Data From satellite images remote sensing instruments, ground measurements, and data models.
U.S. Antarctic Resource Center (USARC)	Maps, orthophotos, satellite imagery, point data, Digital Elevation Models, Digital Raster Graphics, and aerial photography.
British Antarctic Survey (BAS) -Antarctic Environmental Data Centre	Antarctic research results, climate modeling and predictions. Also, oceanic, environmental, atmospheric, geoscience, water, and earth observation data from a variety of sensors and in many forms.
Global Change Master Directory (GCMD) –Global Change Data Center	Data inform climate change research, and datasets include models, instruments and services. It is a workspace as well as a place to store these working operational models. Disciplines include atmospheric science, oceanography, ecology, geology, hydrology, and human dimensions of climate change.
Community Data Portal at NCAR	CDP catalogs observational and computer simulation datasets, sources of data are related to sciences in the areas of: oceanic, atmospheric, space weather, and turbulence.
Earth Systems Grid (ESG) portal	Climate change models include High-resolution, long-duration simulations, data simulations, derived from UCAR/NCAR projects (particularly the Community Climate System Model (CCSM) and Parallel Climate Model (PCM) and the Intergovernmental Panel on Climate Change (IPCC). Also physical” datasets that are generated directly by climate simulations.
USGS Data Portals - GEO-DATA Explorer (GEODE)	Geologic discipline’s programs including coastal and marine geology, earth surface dynamics, earthquake hazards, integrated natural resource sciences, mineral resources, National Cooperative Geologic Mapping, volcano hazards. Also scientific and energy related data.

10. Conclusion

The CLI and the 1986 Domesday rescue and salvage examples demonstrated that preservation as an afterthought is uncertain, will most likely yield only partial results, is expensive and time consuming and is often not 100 percent successful. Also, that maps and atlases designed in closed proprietary systems impede preservation and furthermore, that saving the data is not enough, as entire systems either need to be preserved or recreated to regain intended functionality and aesthetics. For every successful recovery there are many datasets, which have been permanently lost, and many more which are at risk. The two examples given were only saved because of their high profile and demonstrable scientific and cultural importance. The three cybercartographic atlases discussed became community specific archives created outside of the traditional archival system but exemplify proactive archiving in their design. In addition, these are making records by recording oral knowledge and they are contesting the validity of official

treaty archival records, the transmediation of ‘official’ archival records into a digitized form and are creating conditions for secondary provenance. They are re-mapping colonial records with indigenous geonarratives and by doing so are re-interpreting old maps and legal processes according to an indigenous worldview. By examining existing Government of Canada geospatial data archiving initiatives and data management models, it was discovered that complex sensor derived geospatial databases are being proactively preserved although none are being ‘officially’ archived in perpetuity by a recognized archival institution and most of the initiatives examined are not governed by a institutional archival or records management policy. Regardless, these are concrete cases upon which to build. With regards to consultations, studies, reports and initiatives, few address geospatial data explicitly although research data findings and recommendations are mostly transferable to a geospatial context and in some cases recommendations from the public on the topic of archiving were ignored. For the last decade substantial studies have one after the other identified the issues and what needs to be done but none of the key recommendations have been implemented. Also, Canadian experts and citizens make valuable contribution when consulted and government continues to commission studies, which in the main seem to gather dust on shelves or in government servers. The reports and studies are accessible but digital data continue to be at increasing risk and many datasets are lost with limited or no, hope of recovery. People, however, remain committed to see data being preserved and show their commitment by participating in Research Strategy Canada, CODATA and the OGC. In terms of legislation, regulation, directives and policies, the creation of government geospatial data are well covered, but these are rarely implemented and there seems to be no implementation mechanism. There are few existing geospatial data preservation initiatives, and the sorry state of LAC and the lack of trusted digital repositories and records management of data overall is of great concern. It was also seen that laws, rules, directions and policy are irrelevant in Canada unless there are dedicated resources set aside to implement them in the government bureaucracy in real terms. In addition, LAC guidelines for the preservation of geospatial data and maps cannot be effectively used by geospatial data managers, and with recent budget cuts, it is uncertain what LAC’s capacity will be to assist data producers with preservation. It would seem, that as an interim strategy, it is best that data producers and managers incorporate life cycle records management into their processes and build in proactive archiving practices. Regarding research in Canada, the IP2 project was groundbreaking with its Case Studies and General Study 10 and these have provided much insight into geospatial record making practices. These studies provided empirical evidence that geospatial data dissemination and map-making processes generally have many good practices in place, most notably metadata, open source technologies and specifications which make it easier for their products to be archived. Furthermore, data in portals have already been appraised by institutions, and archivists can build archival practices into these. It is hoped that IP3 will implement the findings of IP2 for geospatial data and maps. Also, as seen, GeoConnections commissioned a second study by HAL to examine the preservation of its geospatial data assets, and it was argued that the CGDI is a good model within which preservation can be embedded.

Overall, we are losing digital data, maps and atlases faster than we are producing them. There are weak guidelines, technical and institutional infrastructure is sorely lacking, and limited financial resources have been allocated to operationalize laws and regulation. We have also seen glimmers of hope in some initiatives, and there is tremendous will as witnessed in consultations with experts. Archivists have portals upon which they can build, and some of the examined geospatial data preservation initiatives, portals and all the cybercartographic atlases are proactively building in preservation and records management practices.

Geospatial data, maps and atlases as shown in this paper, are a fundamental source in our memory of the world. They form part of our collective memory system, they help us understand our geonarratives, they counter colonial mappings, are the result of scientific endeavours, represent multiple worldviews, and they inform decisions. We simply need to overcome the many challenges preventing their preservation and build upon existing preservation examples and implement our laws, regulations, directives and policies.

Preserving Tradition and Performing Arts in Digital Form

Life at the Edge of the Internet

Preserving the Digital Heritage of Indigenous Cultures

Abstract

This paper presents our research and field work with the Waorani Indians in eastern Ecuador regarding how they can preserve their digital heritage and culture on the Internet. We focused on empowering the Waorani to use technology to approach the Internet on their terms: to tell their story, not have their story told, to be independent, not dependent. Using analogies to life in the jungle, we explored issues such as digital self-determination, proprietary file formats, control of material entrusted to cloud service providers, international data import/export, content ownership vs. licensing, and intellectual property. Archival systems are only as valuable as their input data. This data is at risk due to competing economic and legal forces that can adversely influence content, digitization, ownership, and permitted usage. To address this problem, we present an encryption framework that encourages medical tourism to indigenous villages by protecting archived medical data, privacy, and constitutional rights.

Authors

Ravi Katikala is Director, professional services at OpenText.com, a content management company headquartered in Toronto, Canada. He has twenty-five years of experience in management and technical consulting. His expertise is in architecture, systems integration, and process automation. Mr. Katikala holds a bachelor of science degree in electronics and communications from www.nitw.ac.in/nitw.

Kurt Madsen is a software architect and process automation specialist within the healthcare, financial services, telecommunications, and aviation industries. He serves on the board of directors for www.wmnf.org community radio. Mr. Madsen holds a master of science degree in computer science from www.poly.edu and a bachelor of arts degree in economics/international trade from www.rutgers.edu. He has taught twenty courses in computer science and management at www.usf.edu and www.phoenix.edu. His conference publications and presentations are available at www.acm.org and www.ieee.org.

Gilberto Mincaye Nenquimo Enqueri is Vice President of www.nacionalidadwaorani.org, Nacionalidad Waorani del Ecuador, the Waorani community association serving 2,200 indigenous people in eastern Ecuador. He works on their behalf to protect their interests with the government of Ecuador, particularly in the areas of education, healthcare, territory, and community development. He is passionate about preserving the digital heritage of the Waorani.

1. Introduction

Preserving the memory of the world in the digital age requires more than good solutions to the technical challenges of the digital documentary lifecycle (data capture, indexing, archival, and retrieval). Any system of digitization and preservation is only as valuable as its input data (i.e., “garbage-in; garbage-out”). For this reason, one must also consider the competing economic and legal forces that drive digital content creation, acquisition, processing, ownership, distribution, and permitted usage. For example, the constitutions of the authors’ home countries—Ecuador and the United States of America—guarantee citizens some degree of

digital self determination.¹ Yet, in Florida, USA, it is common business practice for doctors to withhold medical data about patients from patients because they do not want to provide patients with evidence that could be used against a doctor in court (in the event that the patient sues the doctor for medical malpractice). This business practice, combined with proprietary data storage formats and disparate repositories of medical data, makes it difficult for patients to independently access a unified view of their own medical history. The evolution of medical information processing systems in the USA have been driven, in large measure, by the economic interests of and laws written for doctors, insurance companies, and lawyers. This challenge is an example of information hiding, one of the patterns of human interaction on the Internet, which is explored in this paper. Such patterns potentially present challenges to the digital preservation of the heritage of indigenous cultures. Private companies and even governments are not immune to the special interests and market forces that create these challenges. The work and leadership of UNESCO is needed to build consensus around solutions that protect the input to digitization and preservation systems.

This paper is based on our work with the Waorani Indians of Eastern Ecuador. Their quest for digital self-determination, including their desire to overcome the challenges to preserving their digital heritage, provides a proto-typical model for indigenous peoples elsewhere. There are still pockets of indigenous people throughout the world who are isolated, geographically, culturally, and economically from mainstream society. In general, indigenous people can take one of several paths when initially contacting the outside world, specifically via the Internet:

- ***Indigenous communities remain in isolation*** – They can chose to remain in isolation, avoiding contact with the outside world thereby protecting their cultures from external influences. In eastern Ecuador, the government has set aside land for the Tagaeri in a region of the Amazon in which all outside contact or travel is forbidden. The indigenous people living there, a clan of the Waorani, are left in total isolation and can continue their traditional ways of life undisturbed.² Similar groups in Peru and Brazil have had little if any contact with the outside world.³
- ***Indigenous communities take their chances by themselves*** – They explore newly discovered access to the Internet from towns on the edge of the Amazon and must rely on commercial vendors for preservation and digitization. This approach to preserving their cultural heritage consists of random successes and failures. There is potential for the Internet and all commercial interests that come with it to dilute indigenous cultures.
- ***Indigenous communities receive guidance*** – This is a hybrid approach in which a community receives guidance with digitization and preservation, generally from non-profit non-governmental organizations (NGOs) whose mission and values are aligned with the best interest of the indigenous community.⁴ This is our recommended approach and the basis of this paper. This is the best chance for indigenous people to maintain their digital self-determination as they preserve their culture, history, and legacy on the world wide web. This path requires the leadership of UNESCO and similar organizations.

⁴ <http://www.saveamericasforests.org/Indigenous/indigenous-gallery1.htm>.

Humanity has a choice: for those cases where isolated societies interact with the industrialized world, we can either help them to successfully preserve their cultural heritage on the Internet or let them attempt to make it on their own, risking exploitation, cultural dilution, and loss of digital memory of the world. We see at least three aspects of providing guidance to indigenous communities:

1. ***Legal frameworks that protect the ability for indigenous people to preserve their digital heritage*** – Organizations like UNESCO publish recommendations that governments enact and enforce laws to better protect the digital content acquisition, processing, ownership, distribution, and permitted usage of digital content. This will, in turn, protect the input to digitization and preservation systems. In computer science nomenclature, this problem is known as “garbage in – garbage out.” Any system of digitization and preservation is only as good as its input data.
2. ***Education for indigenous authors regarding the challenges to preserving digital heritage*** – Educate indigenous communities so that they are aware of these challenges. This paper presents our experiences in Ecuador to build common understanding of these challenges as well as potential solutions. This education process is particularly difficult given that indigenous people living in isolation have no prior experience nor frame of reference with which to approach concepts of digitization and preservation in the digital age.
3. ***Technical solutions that mitigate these challenges despite environments with competing commercial interests*** – Technical solutions such as identity escrow achieve a balance between protecting the integrity of information entered into archival systems v. the commercial influences that bias it. It is important protect the digital rights of content originators: both the Waorani in Ecuador and the Musqueam native Americans in British Columbia have independently expressed the same concern, namely their intent to retain some degree of ownership and editorial control over indigenous content when published by third parties. Further, the commercial interests of content originators and the owners of archival systems are not always aligned (e.g., the archival of medical data by health insurance companies in the USA). This paper presents an example of a technical solution in this area.

This paper is organized as follows. First, we describe the experience of living on the edge of the Internet, particularly for the Waorani people in eastern Ecuador. The Waorani provide a model for indigenous people elsewhere in the world who are also living at the edge of the Internet and seek to preserve their digital heritage. Next we explore the import/export of information across the edge of the Internet in the context of constitutional rights and digital self-determination of indigenous communities. We then identify challenges, in the form of patterns, to preserving the digital heritage of indigenous cultures. We show how analogies between patterns in the digital world vs. life in the jungle can provide common understanding when educating indigenous communities on how to best approach the Internet, specifically to document their cultures in digital form. Finally, we present an example of a technical solution that mitigates some of the challenges that they will encounter. We use an example the medical challenges in the USA, which relate directly to challenges the Waorani communities will experience as they archive data captured in their medical clinics in the Amazon. The paper presents an example of how current business practices inadvertently infringe on citizen’s rights to digital self determination, at times even violating constitutional rights. We conclude with recommendations for future work that will help indigenous communities to digitize and preserve their cultural heritage on their own terms.

2. Life at the Edge of the Internet

The expansion of the Internet and its dominant role in our lives has become ubiquitous in almost all corners of the world. Figure 1 shows a map of the Internet that was generated by analysing network traffic volumes.⁵ The lines represent data flowing between the switching nodes in cities. The brighter the line, the higher the volume of data. Stepping back, one can see that this image appears as a network of neurons in a brain. This is a good metaphor for our planet as it becomes wired into a collective consciousness assimilating all peoples and cultures—including isolated tribes in the Amazon.

Figure 1. Map of Internet Traffic appears as neurons in the brain.

As humanity's collective consciousness reaches out to the last remaining isolated tribes, we must consider the degree to which our interactions across the edge of the Internet bias the cultures we seek to document and archive. For example within the past century, Christian missionaries have entered eastern Ecuador to spread the Word of God. This has had profound consequences on the local cultures, mostly positive. Internal warfare ceased as each longhouse group of Waorani was contacted by missionaries, beginning in

⁵ <http://www.opte.org/maps>

1958.⁶ On one hand, the tribes living there have stopped killing each other and now live in relative peace. On the other, some traditional ways such as the medicinal treatments of shamans or witch doctors have been suppressed. While much research has been done regarding the cause of these trends, there is no doubt that western influences have the potential to profoundly alter indigenous cultures.

One must visit the Amazon to truly appreciate its vastness and the isolation of its jungle settlements. Many of the roads in eastern Ecuador lead only to the oil fields and logging camps along the edge of the jungle. The only way into or out of isolated indigenous villages is via boat, small aircraft, or on foot. To reach Tzapino, the Waorani village that was studied for this paper, one must fly north east from Puyo, a small city on the edge of the jungle. During the flight, the volcanoes of the mighty Andes rise to the west while the endless expanse of jungle stretches 3,000 kilometers to the east. Upon reaching Tzapino, a skilled pilot must land a heavily loaded airplane onto a 500 meter grass airstrip next to one of the countless small rivers that feed the Amazon. The airfield is deep in the jungle surrounded by trees and traditional Waorani houses made of bamboo and palm leaves. There is no electricity in Tzapino, no Internet, and no running water. It is a day's walk to the nearest dirt road. Communication with the outside world is batched, not real-time. Figure 2 shows a Cessna 206, which is typical of the aircraft used by missionaries and NGOs to fly supplies into the jungle, export handicrafts to markets, and occasionally to evacuate people for emergency medical care (e.g., snake bite).

The Waorani territories in Ecuador cover 790,000 hectares in the provinces of Pastaza, Napo, and Orellana (which includes the Yasuni biosphere). The 2,200 indigenous Waorani who live in these territories are represented by N.A.W.E., the Nacionalidad Waorani del Ecuador.⁷ N.A.W.E. represents

Figure 2. Mission aircraft used to reach indigenous communities.

⁶ Stephen Beckerman, Pamela I. Erickson, James Yost, Jhanira Regalado, Lilia Jaramillo, Corey Sparks, Moises Iromenga, and Kathryn Long, "Life Histories, Blood Revenge, and Reproductive Success Among the Waorani of Ecuador," *Proceedings of the National Academy of Sciences of the USA*, 106, no. 20 (May 2009): 8134-8139, p. 8135.

⁷ www.nacionalidadwaorani.org

their collective bargaining via meetings the government and private companies such as oil drilling and timber companies. The challenges N.A.W.E. and the Waorani communities face are foreign to many in the industrialized nations, and yet the preservation of the digital heritage of these cultures begins with basic necessities such as access to clean drinking water and emergency medical support.

The Waorani now live on both sides of the Edge of the Internet: they retain their jungle communities while also maintaining a presence in frontier towns and cities such as Puyo, Ecuador, population 25,000. Since joining the modern world, the Waorani no longer depend entirely on the natural work of the forest to survive, and they are no longer nomadic. Instead, the young Waorani who live in neighboring towns are concerned with finding jobs, participating in government projects, and of course western culture, particularly as it appears to them on the Internet. This is a concern to the older generations of Waorani who seek to preserve traditional ways and who still view the land as their mother giver of food. To strike a balance, they are seeking technologies that can improve their management model for governance to help their people avoid poverty. They also want to protect their culture, stories, photos, and intellectual property, which is often published by third parties without their permission.

N.A.W.E. has established goals for the Waorani people in four areas: education, healthcare, territory, and community development (undertaken in partnership with the government and NGOs). Our work focuses on the information archival aspects of these goals, particularly education, healthcare, and the multi-jurisdictional legal framework for information exchange across the edge of the Internet.

2.1 Education

Education is not only essential to bring general awareness and knowledge to Waorani children, it is essential for the digital preservation of their culture. The first schools to bring knowledge of the outside world to the Amazon were established by visiting missionaries. Today, the Waorani are exploring Moodle,⁸ a Learning Management System, to enhance the learning process, including distance learning. Due to the isolation of many Waorani communities—specifically the lack of electricity, telecommunications, and Internet infrastructure—indigenous students will use solar-powered laptops to take off-line classes taught by teachers in Quito, the capital of Ecuador hundreds of kilometers away. Teachers and students will communicate in weekly batch cycles with homework and assignments exchanged via USB flash drives on aircraft serving missionaries, supply lines, and tourism. During this process, the digital heritage of the Waorani can be captured, preserved, and shared with the rest of the world.

Waorani children are curious and intelligent. Even with limited educational facilities, they show tremendous promise. These children love the forest and all of the wonders it brings. The forest is part of their heritage. As they cross the edge of the digital divide, they will be able to make significant contributions to the memory of the world by sharing the secrets of Amazon.

2.2 Healthcare

Many of the Waorani do not have access to modern medical facilities in their jungle communities. In the event of an emergency (e.g., snake bite) or a serious illness, a patient must be transported to the nearest city for treatment. Often times, the availability of transportation makes all the difference between life and

⁸ www.moodle.org

death. These communities need medical clinics to serve local residents as well as medical tourists from other countries (most notably the USA) seeking alternative medicines found only in the Amazon.

These Indian tribes for the most part have lived in isolation from other civilizations, and they have never been exposed to diseases, like Influenza A, which are very common in other parts of the world. These communities have no significant cases of heart disease, cancer, or stroke. Their unique immune system and dietary conditions provide scientific clues into the origins of certain diseases. Dr. James W. Larrick, a physician who made several trips to Waorani community during 1976 conducted several studies on relatively pristine immunologic state of these tribes.⁹

From these perspectives, the Waorani are prototypical of indigenous communities elsewhere in the world. They provide a good example for studying how to preserve the digital heritage of indigenous cultures.

3. The Amazon Information Pipeline

The first aspect of guiding indigenous communities towards digital self-determination is to provide them with an understanding of the legal frameworks that govern their ability to preserve their digital heritage.

Fulfilling Waorani goals—in education, health, territory, and community development projects—involves the free flow of information between the Waorani and other parties such as publishers, research scientists who visit the Amazon, and international organizations concerned with helping the Waorani (e.g., www.saveamericasforests.org). The Waorani are very sensitive to the extraction—and in some cases exploitation—of natural resources from the Amazon (e.g., oil and timber). Regarding the import/export of their information across the edge of the Internet, they would like to retain some degree of ownership and editorial control over indigenous content when published by third parties. We call this effort iPEACE—Information Pipeline for Education and Amazonian Culture Exchange.

3.1 Importing Information into Indigenous Communities

Importing information from industrialized world into Waorani communities appears to pose little legal risk—the Ecuadorian constitution guarantees the right to free access of information. However, once an indigenous community starts communicating and interacting independently with outside cultures, they enter legal structures and economic interests that might intentionally or unintentionally exploit their culture. The following are some excerpts from the Ecuadorian Constitution regarding the [digital] rights of Ecuadorian Citizens:¹⁰

- Free, intercultural, inclusive, diverse and participatory communication in all spheres of social interaction, by any means or form, in their own language and with their own symbols.
- Universal access to information and communication technologies.
- To build and uphold their own cultural identity, to disseminate their own cultural expressions, and to have access to diverse cultural expressions.

⁹ Richard D. Lyons, “A Doctor in the Amazon Probes for Genetic Links to Disease,” *The New York Times*, November 8, 1983. <http://www.nytimes.com/1983/11/08/science/a-doctor-in-the-amazon-probes-for-genetic-links-to-disease.html>.

¹⁰ http://www.mmrree.gob.ec/pol_exterior/constit_eng.pdf.

- The right to protection of personal information, including access to and decision about information and data of this nature, as well as its corresponding protection. The gathering, filing, processing, distribution or dissemination of these data or information shall require authorization from the holder or a court order.
- The right to inviolability and secrecy of hard-copy and on-line correspondence, which cannot be retained, opened or examined, except in those cases provided by law, after court order and under the obligation to uphold the confidentiality of matters other than those motivating their examination. This right protects any type or form of communication.

The Ecuadorian constitution confers additional rights to Indigenous Communities and Peoples:

- All forms of appropriation of their knowledge, innovations, and practices are forbidden.
- To uphold and develop contacts, ties and cooperation with other peoples, especially those that are divided by international borders.
- Ecuador is the first country to recognize Rights of Nature in its Constitution.¹¹

Duties of the state:

- Facilitate the creation and strengthening of public, private and community media, as well as universal access to information and communication technologies, especially for persons and community groups that do not have this access or have only limited access to them.
- Not permit the oligopolistic or monopolistic ownership, whether direct or indirect, of the media and use of frequencies.

3.2 Exporting Information From Indigenous Communities

Special care should be taken when introducing an indigenous community to the Internet for the purpose of bringing that community's culture to the outside world. Protecting indigenous culture through western intellectual property protection systems is difficult, particularly when copyrighting folklore. The international systems of copyright protection require elements not traditionally found in folklore, such as individual ownership, fixing the copyrighted material to a fixed tangible medium, and minimum standards of individual creativity. Should a native story be incorporated into a book or film, the Waorani want to have copyright protection to ensure that the story is presented accurately. Although the Ecuadorian Constitution guarantees such rights to local communities, a closer look into international enforcement and Ecuador's political position is essential to determining protection. When introducing the culture to the Internet or bringing the community's culture to the outside world, care must be taken so that any profit generated from their contributions are properly distributed to the rightful owners. The current global intellectual property protection systems may have to be extended or modified to cover the special nature of information shared by these communities such as their folklore or medicinal methods.

Furthermore, when western pharmaceutical companies extract information from the Amazon regarding indigenous plants and remedies, their focus is on economic interests such as securing patents; less consideration is given to preserving the culture and stories that accompany the use and application of those plants and traditional remedies, even when this accompanying cultural content is captured.

¹¹ <http://therightsofnature.org/ecuador-rights/>.

4. Education – Challenges and Awareness

Education is the second aspect of guiding indigenous communities towards digital self-determination as they preserve their digital heritage. Education empowers them to deal with challenges on their own terms, particularly in an environment of competing economic forces.

We studied the challenges that they face (when preserving their digital heritage) in the form of patterns of human and business interactions, particularly on the Internet. Many of these concepts are especially challenging because they are both difficult to mitigate and difficult to explain to indigenous authors seeking to document their culture and heritage in electronic form. We found that these patterns and challenges are best explained by analogy to concepts that indigenous people find in the jungle.

- ***Symbiosis (Win–Win)*** – Leaf-cutter ants and the fungus that eats the leaves cut by the ants share a symbiotic relationship. The ants bring leaves back to their nests to feed the fungus that grows in their ant mounds. In turn, the fungus consumes the leaves and produce a by-product that feeds the ants. Neither species can exist without the other. This symbiosis is analogous to the relationship between participants in a digital marketplace: Google’s Android apps and Apple’s iStore are market makers that provide an infrastructure on which market participants build and sell applications. Thus, developing mobile apps that provide access to indigenous content is win-win for everyone.
- ***Framework or Infrastructure (Win–Neutral)*** – Bromeliads are epiphytes that grow on trees; the trees provide the structure and environment in which bromeliads grow, but the bromeliads offer little to the trees. Neither species harms the other. Another example well-known to indigenous communities is a jungle airstrip. By analogy, there are many examples of frameworks and infrastructure in software. One of them is Microsoft’s .NET.
- ***Viruses in Software (Win–Lose)*** – Strangler figs are vines that grow around trees, constrict them, and eventually kill the very hosts that support them. Likewise, computer software viruses infect a host application, cause damage, and eventually die with the rest of the system
- ***Censorship*** – Consider an oil drilling company in the Amazon that requires its employees and indigenous people to sign nondisclosure agreements regarding pollution. How do indigenous communities balance their need for clean drinking water vs. continued payments for drilling rights in their territories? How can they turn to the industrialized world to provide best practices for preserving digital heritage when oil drilling companies in the USA use nondisclosure agreements and sealed court records to block independent scientific research into the adverse health effects of hydro-fracturing drilling?¹² Censorship—however justified—impedes the free flow of information into archival systems, which in turn limits the value of such systems.
- ***Adaptation (or extensibility)*** – Termites adapt to their environment by building nests to suite their environment. In Africa, termites build towers on the ground in a dry environment. In the Amazon, termites build nests in trees so they do not wash away during torrential rainstorms. This adaptability of termites is analogous to the software design concept of adaptability and extensibility, namely that a system (its structure, functionality, and/or intended use) is permitted

¹² Michelle Bamberger and Robert E. Oswald, “Impacts of Gas Drilling on Human and Animal Health.” *NEW SOLUTIONS: A Journal of Environmental and Occupational Health Policy* 22, no. 1 (2012): 51-77.
<http://baywood.metapress.com/openurl.asp?genre=article&id=doi:10.2190/NS.22.1.e>.

to change over time, subject to constraints such as technical limitations or contractual obligations to customers.

- **Information hiding** – A publisher blocks, limits, or alters information produced by a content originator (both roles may be the same entity). Example one (positive): Digital Rights Management (DRM) systems use encryption to protect the intellectual property rights of the content owners by hiding information from non-authorized parties. Example two (negative): In the USA, doctors withhold information from their patients to protect against being sued. In some cases, patients withhold information from their doctors to protect their privacy (because doctors are required to release medical data that they collect to insurance companies).
- **Information Expiration** – Information in an archival system is destroyed after a certain period of time, generally to save disk space once records retention requirements have been met. This pattern is analogous to the spoiling of food in the jungle. Another example is store receipts with invisible ink that disappears after the merchandise return period has expired (the Waorani do see receipts with invisible ink at stores in the town of Puyo). Another example is a doctor who uploads information with the intent that it will only be available for a limited time.
- **Proprietary vs. open-source data formats and computer software** – It is important that indigenous authors understand both the licensing terms and encoding schemes of the software they select record and archive their cultural heritage. Proprietary software is typically leased as a license to access, but not own. Open-source software is generally distributed freely with support services sold separately. To explain these concepts, we demonstrated proprietary vs. open file formats to the Waorani leadership. We showed them the same file as viewed in both Microsoft Word 2007 running on Windows 7 and LibreOffice running on Ubuntu. Then we showed them how these two programs store files in different file formats. It became clear to them that open formats such as DocBook XML can be viewed independently of the source application while proprietary formats such as Microsoft Word require the original program for interpretation.

Figure 3 maps these patterns and metaphors to concepts in the jungle. Additional patterns follow:

Figure 3. Guiding the Waorani towards digital self-determination with metaphors.

- **Intellectual property, leasing vs. owning** – if the Waorani post their stories on the Internet, who owns them? How are they paid for their content? Do they sell a subscription or make a one-time sale of their stories? Indigenous people should understand the consequences of this issue prior to signing contracts involving intellectual property ownership.
- **Intellectual property, exclusivity** – in intellectual property law, exclusivity applies when the subject of content grants exclusive rights to a single party (such as a publisher) and foregoes the possibility of granting similar rights in the same content to another, unrelated party. We recommend that indigenous communities grant non-exclusive rights to their stories. This way, they retain ownership over their content and the ability to resell or re-license it to another party in the future.
- **Hyperlink Transitivity** – the legal claim that a website owner becomes responsible for all content reachable by hyperlinks on the site. If an Internet user visits a Waorani website, and that site links to other blogs (e.g., perhaps critical of the oil industry), do the Waorani become liable for third party blogs?
- **Content aggregation** – Mixed content from different sources, in particular different indigenous communities that aggregate their content together to make a compelling website about their region.
- **Broker** – A neutral, third party who mediates between a provider or a consumer. For example, a real estate agent takes a commission to broker sales. An electronic clearing house of data or transactions that charges an e-fee to connect indigenous people (e.g., to bring Indian handicrafts to market).
- **Information Escrow** – A variation of the broker pattern in which an independent, third party holds information on behalf of two counter-parties until a transaction between those two counter-parties has been completed. For example, if a publisher insists that Waorani stories be encoded using a proprietary digital rights format, then the Waorani could insist that the publisher keep the original content in unencrypted form on deposit with an escrow service.
- **Information quarantine** – Temporarily isolating data or programs so that they cannot interact with the rest of a computer system. For example, antivirus software quarantines suspicious files.
- **Monopoly of supply** – one company (monopoly) or a few companies (oligopoly) that dominate a market by controlling the supply of product or server. This is the classic definition of monopolistic power. The Organization of Petroleum Exporting Countries (OPEC) is an example of an oligopoly because it controls a large portion of the world's supply of oil. The indigenous people of the Amazon understand the power of oil drilling companies.
- **Monopoly of demand** – one or a few companies dominate a market by controlling the demand for a product or service, or the payment thereof. The health insurance companies in the USA provide an example by effectively acting as one organization by sharing private patient data and controlling almost all payments to medical providers such as doctors (i.e., the demand-side of the monopoly). Unfortunately in the USA, insurance companies are except from the Sherman Anti-Trust Act, a federal law indented to protect citizens against the abuses by monopolies.¹³ Rescinding this exception would improve healthcare in the USA.

¹³ http://en.wikipedia.org/wiki/Sherman_Anti-Trust_Act; http://www.huffingtonpost.com/dylan-ratigan/why-would-we-let-them-rig_b_302480.html.

- **Value-added reseller** – A travel agent who’s website sells tour packages into the Amazon and provides additional services to complement those of the Waorani.
- **Affinity groups / social networks** – The ability for like-minded people to gather on the Internet for a common purpose. For example, Mycologists traveling to Waorani territory study mushrooms and fungus. An affinity group would allow Mycologists to interact with each other and share data on the Internet—under terms controlled by the Waorani—for their common causes such as researching mushrooms within Waorani territory. Another example is enabling the Waorani to band together to face the oil companies with one e-voice.
- **Lock-out** – Some doctors in the USA do not take cash (even though US currency states that is “legal tender for all debts public and private”). Instead, these doctors only see patients who can pay for services through health insurance. Further, if a patient has insurance, some doctors will not allow that patient to pay with cash.
- **Extortion (a.k.a. Protection)** – A third party demands payments for continued business operations by threatening to shutdown the victim’s website. Criminals flood the website with fake page hits to flood the servers in a denial of service attack. Service is restored when the victim pays “protection” money.
- **Reuse by framework** – A software framework is a reusable infrastructure that can be extended and customized to solve similar problems.
- **Reuse by libraries** – A collection of software building blocks that can be combined to solve similar problems.
- **Protocols** – peer-to-peer, point-to-point, multi-cast, push vs. pull
- **Syndicated content** – the ability of the Waorani to join other indigenous communities throughout the Amazon, either to sell their web content (and generate revenue for Waorani communities) or to purchase access to a wider market.
- **Content authentication** – Methods to verify that the content originator is in fact who he claims to be.
- **Content non-repudiation** – Methods to assert that the content originator cannot deny previously originated content.
- **Copyright law varies by country** – Copyright laws protecting Waorani content vary from one country to the next.

5. Technical Solutions to Preserving Digital Heritage

The legal frameworks that govern the preservation of digital heritage often come into conflict with competing commercial interests that drive digital content processing, ownership, and permitted usage. Technical solutions exist to mitigate these challenges. Providing such solutions is the third aspect of guiding indigenous communities towards digital self-determination as they preserve their digital heritage.

A key theme of this paper is that archival systems are only as valuable as their input data. A secondary theme is that competing economic interests may bias, impede, or even prevent the free flow of

information into archival systems. Thus, organizations like UNESCO can help indigenous societies by bringing awareness to research into technical solutions that protect indigenous rights to digitally preserve their culture and heritage in an environment of competing commercial interests.

For example, the Waorani would like to use the Internet and archival technology to preserve and share their ways of traditional medical care using natural resources found in the Amazon. One potential source of this information is Waorani healthcare clinics, which serve the Waorani as well as foreigners—medical tourists—who travel to Waorani territory to seek out traditional healthcare. The Waorani encourage foreigners to visit their healthcare clinics for two reasons: first this brings money into Waorani communities; second, this is another way in which the Waorani can share their cultural heritage and traditional methods of healthcare with the outside world.

Unfortunately, medical tourists from the USA who travel to Waorani territories may be reluctant to visit indigenous medical clinics because some medicines and medical practices from the Amazon may be considered experimental or otherwise not viewed favorably by health insurance companies back home in the USA. Further, the medical data collected from these traditional treatments could be used against them to deny future insurance applications and/or claims. The unintended consequence is a disincentive to archive valuable information. This adversely affects everyone from patients to independent researchers who study anonymous medical data to determine the efficacy of traditional Waorani medicines.

The problem is that in the USA, patients have little control over the scope of information permanently released by their doctors to third parties such as health insurance companies and the Medical Information Bureau (www.mib.com) which archive medical data. These companies do have a legitimate business need to use archived medical data to combat insurance fraud. However, in some scenarios, they can infringe upon a patient's right to privacy by collecting medical data when the patient has no legal obligation to provide it. Consider that the MIB maintains personal medical records for seven years while some insurance applications only require applicants to provide medical history within the past five years. What happens if a person applies for insurance six years after he is diagnosed with cancer? If that diagnosis occurred in the USA, then it would likely be discoverable by the insurance company and used as justification to deny the application for medical coverage. However, if that diagnosis occurred in an indigenous medical clinic outside of the USA, then the insurance company would likely not have access to that diagnosis and would approve the application for medical coverage. In both cases, the applicant can be truthful on his insurance application and no laws are broken. Yet, the outcomes are very different.

The fourth amendment to the constitution of the USA guarantees a citizen's right privacy in their personal effects, which applies in this case. In practice, however, there is little privacy in the USA because businesses control many aspects of the information systems that facilitate daily life in the digital age. The Ecuadorian constitution provides even more explicit protection of personal [electronic] information than the constitution of the USA. But if ubiquitous business practices have the unintended consequence of undermining the constitution of the USA, what is to stop the same fate in Ecuador?

There is a simple and effective technical solution that addresses these challenges via identity escrow, which separates medical data from the authentication data used to identify patients. This separation of concerns gives patients (and potential medical tourists to Waorani territories) the privacy and peace of mind they require before they consent to the collection, archival, and limited, directed release of their medical data. Likewise, from the perspective of medical service providers, the government, and authorized third parties, identity escrow provides the accountability and transparency infrastructure that could support the involuntary release (from the patient's point of view) of authentication and medical data when

necessary to comply with the law. This combination protects the digital self-determination of citizens who provide content for archival systems while meeting the needs of commercial interests.

The rest of this section describes our proposed technical solution, Identity Escrow, in more detail. The system separates authentication data from medication data via two, encrypted databases each with separate access security. These databases are joined together by Medical Record Locator (MRL). The identity database is populated when patients initially register to use this cloud service (e.g., name, address, date of birth, government-issued identification number). The medical database is populated when doctors upload medical data via the MRL after treating a patient. The doctor only has access to the patient's MRL and all associated medical data; no patient-related information from the identity database is available to the doctor. Figure 4 illustrates how the use cases of this technical solution work together.

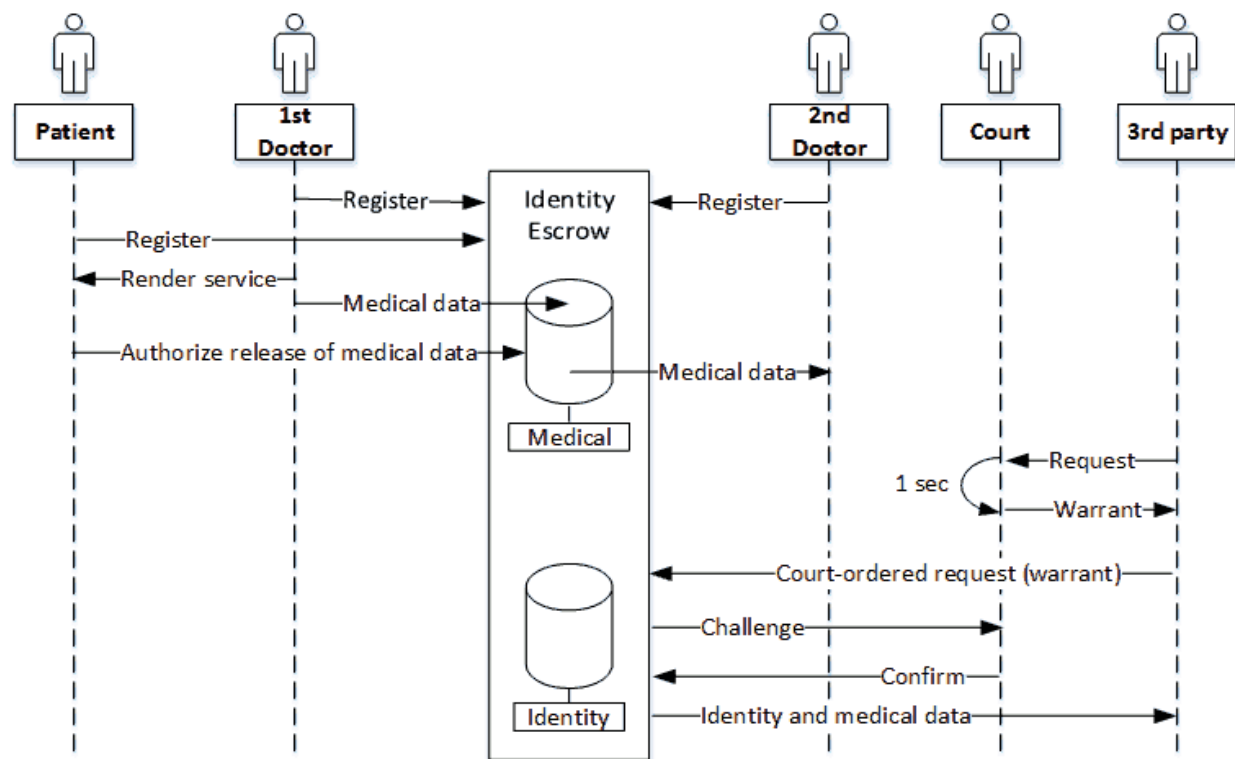

Figure 4. Identity Escrow – Protecting the input data to an archival system from competing interests.

Use case: Medical Service Provider Registration – A provider such as a doctor registers with Identity Escrow by creating an account and providing his or her authenticating information. Depending upon the jurisdiction, it may be necessary for third party such as a government agency to verify that the doctor has a valid license to provided the services in question.

Use case: New Patient Registration – A person seeking medical care with privacy registers with Identity Escrow by creating an account and providing authenticating information. Depending upon the jurisdiction, it may be necessary for a third party such as a notary public to attest that the registration and identity information has been independently verified (e.g., using the patient's passport as documentation).

Use Case: Patient Visits a Provider – When a patient visits a provider such as a medical clinic staffed by doctors, the patient does not provide any identifying information. Instead, the patient presents an Identity

Escrow account number, which the clinic staff use to look up the patient's account. The patient then answers challenge questions, presented by Identity Escrow, to authenticate himself (e.g., to confirm that the account number has not been stolen). Thereafter, the medical examination can commence. Doctors have access to any previous patient medical history provided that the patient has marked such information as visible in his Identity Escrow account. Once the medical services have been rendered, the doctor can upload new medical data into the patient's medical records at Identity Escrow. Payment for services rendered is arranged separately and is outside the scope of Identity Escrow.

Use case: Voluntary release of patient information – A patient may wish to voluntarily release his medical information to a third party, for example to support an application for insurance coverage or to apply for a new job. This use case involves two sub-cases that both start when the patient logs into Identity Escrow to schedule a release of information:

1. The patient identifies a third party who has previously registered with Identity Escrow (e.g., another doctor in the USA who will examine the medical data uploaded at a Waorani clinic in order to render a second opinion). Identity Escrow sends a message with a security key to the third party Identity Escrow with an authentication token that matches information sent independently by the patient to the third party. The key is valid until its time-to-live value expires. Finally, the third party uses the key to pull the required medical data from Identity Escrow.
2. The patient logs into Identity Escrow to schedule a release of information, and Identity Escrow provides the user with a temporary access number. The patient provides this access number to the third party. The third party pulls the relevant medical data from Identity Escrow.

Use case: Involuntary release of patient information – To protect the medical provider and third parties such as insurance companies, Identity Escrow may release protected patient information when necessary to comply with the law. The patient must agree to this condition during the registration process. Generally, a court-ordered warrant or subpoena is required to release authentication and medical data without the patient's consent. This varies by jurisdiction.

Use case: Research – Depending upon the jurisdiction, Identity Escrow may release medical data only (without identifying information) for educational and research purposes.

Other use cases – Other cases include account closure. When a user closes his account, Identity Escrow will maintain archived medical data to comply with requests for involuntary release of patient data.

In summary, Identity Escrow provides an example of how a technical solution can mitigate the challenges to digitization by separating competing concerns, namely the digital content vs. the business transaction that produced it. This protects the content originator's right to preserve his or her digital content in an environment of competing commercial interests. Thus, a content originator—such as a medical tourist to a Waorani alternative health clinic—is encouraged (not discouraged) to authorize the archival of sensitive personal information. The data collected from thousands of patients over time will become part of the digital heritage of traditional Waorani medical treatments. The example presented above mitigates the following patterns of challenges to preserving digital heritage: censorship, monopoly (of demand), information hiding, expiration, and Identity Escrow.

6. Conclusion

We finish with the following conclusions and recommendations for future work:

- There are three paths to preserving the digital and digitized heritage of indigenous cultures: leave them alone, let them take their chances on their own, or provide them with guidance. Guided preservation is the best path, especially when performed by organizations like UNESCO and NGOs whose mission and values are aligned with the best interests of indigenous societies.
- Any system of archival is only as valuable as its input data. This presents a problem when the commercial interests of the owners of archival systems are not aligned with the interests of the content originators. For example, the archival of medical data by health insurance companies in the USA is driven by financial concerns, not the patient's desire to store a life-time portfolio of useful medical information in the context of privacy. This struggle by citizens for digital self-determination is part of on-line culture in the digital age. And it biases the information to be archived.
- Indigenous communities in the Amazon will encounter the same problems as their North American counterparts when they cross the edge of the internet unless organizations like UNESCO and NGOs encourage governments to improve laws that protect individual rights to the digitization and preservation of personal information. Input data that is entered into archival systems depends on these protections.
- Such legal and technical protections will encourage more medical tourists to visit medical clinics in the Amazon to experience alternative medicines and exchange culture with indigenous communities such as the Waorani.
- Technical solutions can mitigate legal, ethical, and economic challenges to digitization and preservation. For example, identity escrow separates the concerns of content originators vs. the owners of commercial archival systems by separating the information produced by a transaction from the financial and personally-identifiable information about the transaction. This facilitates data privacy, right to oblivion, and right to access.
- Indigenous people must develop the skills to approach the Internet on their own terms. This requires education regarding the challenges to preserving their digital heritage. They should not become dependent upon outside influences to control their data and Internet access. Ironically, they need help to do this, namely from trusted organizations like UNESCO that do not have a vested interest in exploiting these societies. This is the surest way that they can empower themselves and preserve their culture in the brave new world. Indigenous information must flow both ways without diluting cultures. They are eager to learn our ways; we must help them preserve theirs.
- Finally, any solution computer-based learning center deployed in the jungle must be self-sustaining and permanent. The indigenous population must be taught to administer their computers by themselves.

Digital Madness, Archival Theory and the Endangered Sound Archives of Radio Botswana

Lekoko Kenosi

Archival Studies Program, University of Botswana

Abstract

In recognition of the contributions of sound archives to the collective wisdom of humanity UNESCO has set aside 27 October as a day for the celebration of Audiovisual Heritage. And despite the shared universal definition of a record as any “document regardless of medium,” the trust placed on paper at the exclusion of other information carriers continues to dominate the mindset of many in Africa. The result of this bias has been little attention paid on the preservation of sound archives. At a professional level, while many theoretical assumptions have been made about the character and treatment of paper records, the literature on the preservation of sound archives continues to come from thinkers without a “mainstream” archival degree. Using the sound archives of Radio Botswana as a case study, this author applies traditional archival theory methods to this genre of records. By so doing the presenter hopes to consolidate, even critique, the application of traditional archival theory to sound archives. In the process of doing that, and with the theme of the conference in mind, an international call to halt the looming eclipse of Radio Botswana sound archives- in an age of digital madness- will be globally launched.

Author

Dr. Lekoko Kenosi has a Bachelor's degree from the University of Botswana, a Master's degree in Archival Studies from the University of British Columbia, Vancouver, Canada and a Ph.D. in Information Science from the University of Pittsburgh, USA. A U.S. Fulbright Scholar in Archival Studies, and a member of the UBC InterPARES project, Dr. Kenosi has published extensively in the area of Records and Archives. He teaches archival theory, records management, electronic records and sound and cinema/television archives at the University of Botswana.

1. Introduction

Even though the first record produced by humans is a sound we take sound so much for granted. In fact the perception that audiovisual records are only good for entertainment is still pervasive. However, that perception is fast disappearing as more archival centers recognize the need to preserve sound archives. In the last few years there has been a proliferation of professional bodies dedicated to the proper preservation of sound archives. Among them Association of Moving Image Archivists (AMIA); Association for Recorded Sound Collections (ARSC); International Federation of Film Archives (FIAPF); Fédération Internationale des Archives de Télévision / International Federation of Television Archives (FIAT/IFTA); Federation of Commercial Audiovisual Libraries International (FOCAL); International Association of Sound and Audiovisual Archives (IASA); SouthEast Asia & Pacific Audiovisual Archives Association (SEAPAVAA) and the Co-ordinating Council of Audiovisual Archives Associations (CCAAA). Even more interesting is the fact that the International Council on Archives (ICA), a global professional association of all archivists, is affiliated to CCAAA, rather than the other way round. Moreover, the terminology or jargon used by these audiovisual associations sometimes differs from that learnt in traditional archival setups and was one of the reasons that motivated this study.

Sound or voice is one of the most powerful means of conveying facts and actions by both literate and illiterate communities. The use of sound to communicate is not just a monopoly of humans only. Domestic and wild animals also communicate their emotions, and maybe their facts and their acts through sound. In its annual commemoration of the World Day for Audiovisual Heritage¹ UNESCO has underscored the importance of sound archives by reminding us that, the first moonwalk original recording that took place on 20 July 1969, cannot be located and is presumed lost. In Africa in general, and in Sub-Saharan Africa in particular, song, dance, oral traditions, folklore, together with the modern written record, are still the chief means of transmitting all forms of knowledge from one generation to the next.

Despite this fact archival theory has not engaged sound records with the same vigor that it has done with the written and the electronic record. Using the sound of Radio Botswana as a case study this research attempted to investigate the application of key components of archival theory to the sound archives of Radio Botswana, drawing in the process strength from Heather MacNeil, who marshaled us to re-examine archival theory”² as a way to challenge old truths. So, what are these components? These key components include:

- Acquisition
- Provenance, Respect des Fonds and Original Order
- Appraisal
- Arrangement and Description
- Access, Preservation and Digitization

In choosing these components I am alive to the fact I am opening myself up to a plethora of criticism. I am back to Vancouver today, to welcome the criticism because archival theory, like all theories, has not developed without controversy. Indeed, a theory that invites passive and monolithic responses is sterile, bankrupt and over time condemns itself to extinction. The above components might sound like a monotonous script to postmodern scholars. In “Archives, Records and Power...” Terry Cook and Joan Schwartz are fatigued by what they call “a script that has been naturalized by the routine repetition of past practice.”³ What Hugh Taylor has referred to as “archival fundamentalism or the reluctance to explore new areas of theoretical and practical growth,”⁴ Terry Cook warns that “a profession rooted in nineteenth-century positivism.... may now be adhering to concepts, and strategies and methodologies, that are no longer viable in a postmodern and computerized world.”

2. The Primary Objectives of the Study and the Research Questions

The primary objectives of the study were to assess the application of key components of archival theory to the management of sound records at Radio Botswana Sound archives

¹ UNESCO, “27 October Declared World Day for Audiovisual Heritage.” Also available at, http://portal.unesco.org/ci/en/ev.php-URL_ID=25525&URL_DO=DO_TOPIC&URL_SECTION=201.html

⁴ *Ibid.*, p. 179.

2.1 Methodology

Data gathering methods of this study included interviews using face to face administered structured and unstructured interview questions, the researcher's personal observations and literature review.

2.2 Location of the Study

Radio Botswana Music Archives, Gaborone, Botswana

2.3 Population of the Study

All the three sound archivists who work for the Radio Botswana Music Archives were interviewed

2.4 Limitations of the Study

Bias is always a factor in both qualitative and quantitative research. I come from a mindset that believes that sound records are marginalized and have been given a raw deal in archives. The research could only get a snapshot of the Sound archives of Radio Botswana due to time constraints. The permission to undertake the research came very late. A more in-depth graduate work is needed to do justice to the study. However, despite these limitations I still believe that the findings of this study carry a high degree of validity.

2.5 Research Ethics

In most African government the media falls directly under the Office of the President. The Office of the President granted the research permit based on the topic. Consent was given based on voluntary participation.

3. Findings of the Study

3.1 The Acquisition of Sound Archives by Radio Botswana Archives

Respondents stated that they acquire their records from Live Special programs, for example when they cover the President opening a school or a hospital, pre-recorded material or in the case of music through donations from artists. Retired Broadcasting officers also freely surrender their records to the Radio archives.

3.2 Provenance, Respect des fonds and Original Order

3.2.1 Provenance

In archives the terms provenance, respect des fonds and original order form the core or nucleus of archival theory. Provenance refers to the agency creating the records. As the primary creator of sound records held by the archives Radio Botswana can claim the provenance of these records. However, in complex organizations, like Radio Botswana, with a lot of Directorates, one does not know whether to start with Radio Botswana as the provenance or to call a directorate provenance. 29 years ago Michel Duchein recognized this problem when he wrote that:

the agencies which possess numerous personnel and multiple powers are, in general, divided into areas called divisions, directorates, branches, sub-branches, departments, and so on, each of which exercises a definite part of the powers of the agency. It is clear that the records created by these divisions constitute organic wholes. There is, therefore, every interest in taking these divisions as the basis of internal arrangement of the fonds of the agency...⁵

This problem is bound to grow worse in the 21st century where multi-national chain store companies like Walmart, Coca Cola, or Apple have become dominant. So, in short, archivists now need to address the question of where provenance begins and where it ends in huge complex organizations that have huge record producing departments under them.

3.2.2 Respect des Fonds

One cannot discuss respect des fonds without reference to provenance. Duchein says that the majority of definitions of respect des fonds rests upon provenance to the point where countries of Germanic language refer to it as *provenienzprinzip* or *principe de provenance*.⁶ Mario Fenyo, archivist of America, dismissed the concept of a fonds saying that no one knows what the fonds means, not even the French who invented it,⁷ Fenyo's conclusion, however, has not stopped subsequent archival scholars from recognizing the fonds as one of the most important discovery in archival science. In fact, Duchein goes as far as saying that:

with few exceptions, the principle of respect des fonds is universally accepted as the basis of theoretical and practical archival science. Criticisms of the principle bear only.... on its applications and not on the principle itself. It is reasonable to think that it will never again be fundamentally questioned and that it constitutes a definitive fact of archival science.⁸

Heather MacNeil has also celebrated this principle. In "Archival Theory and Practice: Between Two Paradigms," MacNeil says, "the cardinal principle on which the medical profession is built is above all do no harm..... Similarly, the cardinal principle on which the archival profession is built is respect des fonds. While its proper application is frequently undermined by a seemingly endless list of realities- inadequate resources, authority, education, training- the principle is, in its own way, presents an equally worthy focus of archival inspiration."⁹

On this principle this research found out that twenty years ago with limited archival education and training, without even knowing that they were doing the right thing, archivists of Radio Botswana Sound archives practiced respect des fonds. They did this by grouping similar sound records together under the genres of Reggae, Rock and Roll, African music, etc, etc, This classification system led to the accumulation of records under this broad family names. All Bob Marley's records were kept together under Reggae. All the albums of the Beatles were together under Rock and Roll and African musicians music were archived under African jazz. This system made it easy to see similar records archived

together. This classification of the analogue sound records of radio Botswana affirmed the principle of “archives as universitatis rerum,” the indivisible and interrelated nature of archives, articulated by Luciana Duranti in her article on “archival science.”¹⁰ Respondents of this research lauded this system, saying that they never had any problem retrieving any song or tape that they wanted to play.

The success story that I have just described began to change drastically when management decided to replace these amateur archivists with graduates of library science. The principle of respect des fonds was replaced by chronological classification. All music albums entering the archives were no longer classified according to genre and artist but rather according to the date that the album entered the archives. Now retrieval and location of the song when it was needed became a big problem for the station.

This movement was a great regression that took Radio Botswana archives back to the days of Armand Camus and Pierre Daunou after the French revolution, when the duo decided to view records as discreet items and introduced chronological classification instead of records families. It took the courage of Natalis de Wailly¹¹ to reinstate the fonds as the most defining principle of archival science. In “Archival Science” Duranti talks of how ideas borrowed from the library methods created a real dichotomy between the theoretical and methodological concepts related to the nature, form, formation and management of archival documents against those that did not take into consideration the nature of archival materials as determined by the practical and administrative circumstances producing them.¹²

3.2.3 Original Order

The principle of respect des fonds is closely related to that of original order. Not only should records accumulate steadily under their families but the original order of their aggregation has to be respected as well. While this principle was found to be true for the analogue records of radio Botswana, it was not very for music that was archived digitally. Here, retrieval of any song posed no problem as long as the song’s name or artist was known. This finding is in line with Heather MacNeil’s assertion that in “paper based systems, where records are physically ordered in labeled files, usually in accordance with a classification scheme, the physical and contextual aspects of the records are intimately connected; original order has tended, for that reason, to be associated with physical arrangement. That association is no longer valid for most electronic records.”¹³

3.3 Appraisal

Rather than use the technical term “appraisal” respondents were asked if they ever destroy sound and if so under what circumstances. All the 3 respondents interviewed admitted that there are records that they erase a day or two after they been broadcast. What became clearer then in this research is that some programs are more important than others. This makes it possible to develop a comprehensive retention schedule for the sound records of Radio Botswana.

¹⁰ Luciana Duranti, “Archival Science,”

¹¹ The circular of 24 April 1841 signed by Duchatel, the minister at the Ministry of Interior codified the principle of respect des fonds.

¹² Duranti, “Archival Science,” p. 7.

¹³ MacNeil, “Archival Theory and Practice,” p. 526.

3.4 Arrangement and Description

The findings of this study showed that it was difficult to locate analogue records because of the system of chronological arrangement. There is a need to pay attention to the principle of respect des fonds. In the digital environment it did not matter whether records were arranged by the author or by the name of the creator because they would still be retrieved anywhere.

3.5 Access, Preservation and Digitization

Most archival repositories exist to provide access either to internal or external stakeholders or to both. Radio Botswana Sound Archives is no different. This research found out that it is easier for the staff to provide access to sound in the digital form than in analogue form for the simple reason that searching for the record in the digital environment takes split seconds while doing the same for analogue records might take forever. However, when asked about the sound quality and stability of the medium 2 out of 3 trusted the analogue records more. However, when asked whether they want to remain with analogue or digital records all the 3 archivists were eager to have their records digitized despite the fragility of the digital medium.

4. Conclusion

More detailed and sustained studies on Sound records and archival theory at a graduate are needed. However, preliminary findings of this study show that the basic tenets of archival theory are applicable to sound records in both analogue and digital formats. For me personally, these preliminary findings reflect that archival theory is relevant for all kinds of records, including sound records.

Editing Historical Music in the Age of Digitization

Jørgen Langdalen

The National Library of Norway

Abstract

Norwegian Musical Heritage—a program for preserving, editing and publishing historical music from Norway—benefits from digitization programs like that of The National Library of Norway. Digital media, in turn, opens new possibilities in the publication of historical music editions on the Internet. In both cases we see that digital technology draws new attention to the historical documents serving as sources of music edition. Although digitization strips them of their material form, they gain tremendously in virtual visibility. This visibility may contribute to a shift in critical edition, away from a predominant concern for the need to reach a single unequivocal reading, toward a greater interest for the real diversity of the sources. This broadened perspective may moderate the canonizing effect associated with traditional editions and open a more spacious field of interpretation and experience. In this way, more people may take part in the formation of cultural repertoires, in a media situation where such repertoires are no longer provided by traditional institutions, venues and media.

Author

Jørgen Langdalen is a senior researcher at The National Library of Norway, where he takes part in the preparation of the new Johan Svendsen Edition. Langdalen was trained as a music historian at The University of Oslo, where he earned his Ph.D. with a dissertation on Gluck and Rousseau.

1. Introduction

This paper presents a new initiative for preserving, editing and publishing historical music from Norway, called *Norwegian Musical Heritage*. The aim of the program is to make historical music available for performance and research in Norway and abroad.

I have been engaged by the National Library of Norway to take part in the preparation of a new, complete edition of the Norwegian composer Johan Svendsen's works. The Johan Svendsen Edition is a pilot project in *Norwegian Musical Heritage*.

Johan Svendsen made considerable success on the European music scene from the 1860s to the 1880s, both as a composer and as a conductor, and he was highly esteemed in America, too. In 1883, he accepted the position as musical director of The Royal Theatre in Copenhagen, and his career as a composer petered out, but his activity as a conductor on the international scene continued. Several prestigious institutions, including the Metropolitan opera in New York, tried to recruit him as a resident conductor, but he stayed in Copenhagen the rest of his life.

Svendsen left an impressive corpus of works in the nineteenth-century Romantic tradition—chamber music, symphonies, symphonic poems and concertos, and not to forget his masterful orchestrations of iconic pieces from the international Romantic repertoire.

My intention here is to show the influence of digital technologies and digital media on historical music edition. However, I will not only concentrate on the usefulness of digital technology in source studies and editing, but also emphasize the use of digital technology in the presentation of the editions on the Internet. Ultimately, I want to discuss the way digitization and digital media transform the meaning and role of historical music in present day music cultures.

2. Digitizing Programs

One important condition for the Norwegian Musical Heritage initiative is the digitizing program of The National Library of Norway. The library is a central partner in the initiative and holds the major part of the source material relevant for the editing projects.

The *primary sources* of any historical music edition include handwritten and printed scores left by the composer and his publishers. A manuscript in the composer's own hand is naturally an important primary source, but the production of printed scores, too, will normally be supervised by the composer and reflect her or his intentions. In twentieth-century music, even recordings are sometimes valuable primary sources, especially in the absence of scores.

Secondary sources include personal documentation such as correspondence and diaries, as well as documents from the publishers, concert institutions and so on, all of which may provide information about the genesis of the work. Printed matter such as newspaper reviews, articles and books may give supplementary information about the work's reception history, as do sometimes photographs and films.

The National Library of Norway has decided to digitize its entire collection and has come a long way in this enterprise. A major effort has been made in the field of musical manuscripts. Nearly 3,500 musical manuscripts have so far been digitized and published on the library's website, and many more are in the process.

Digitizing programs in libraries and collections across the world make modern music edition infinitely much more efficient than the old trade based on traveling and copying by hand. All kinds of source material used in critical edition are put at the disposal of the editors in digitized form.

Take Svendsen's symphonic poem *Zorahayda*, a piece of nineteenth-century musical orientalism, premiered in Christiania, Norway in October 1874.

3. Historical Music Edition and Canon Formation

In general, digitizing technology and digital media offer great new possibilities for preservation and remediation of historical documents. Yet, in the process, the cultural heritage itself is transformed. Any process of preservation and remediation of documents involves the intervention of new agents and interests. It is a highly selective process. The historical context that determined the meaning of the original documents—their status, accessibility, and use—is replaced by a context in which new interests define their meaning.

Thus, obviously, successful digital preservation of cultural heritage does not just depend on the permanence, authenticity, identity and integrity of the digital documents themselves, it also depends on their recontextualization in a new media situation—on the way they are put to use.

Historical music edition is a case in point. Traditionally, historical music edition has served as an authentication and authorization procedure aimed at preserving musical works from oblivion or from dissolving in an endless series of performances based on unauthorized scores. Although the sources—manuscripts and early prints—are the *sine qua non* of historical edition, it is in the nature of things that they are subordinate to the finished, edited version. The final edition, as soon as it has been completed and published, *replaces* any source. What is then presumably revealed, is the work “itself”, considered as a constant and invariable entity buried under the pile of sources. The “work” in this sense is, of course, an illusion.

The establishment of the text of a musical work—its “wording”, so to speak—is the central task in editing. The critical apparatus of the edition—in the name of source criticism and sound philological craftsmanship—will describe and discuss any possible reading and leave no details in the source material uncommented. Yet, many conflicts in the sources only find their resolution through an interpretive effort by the editor. Rather than openly discussing this interpretive effort, traditional editions refer to the authority of the underlying mysterious *Urtext*. The overwhelming yet deceptive impression left by multi-volume, monumental collected editions is that the editors have reached the ultimate and indeed only possible reconstruction of the opus.

There are good practical reasons to reduce the number of possible readings and present the performers with an as unequivocal score as possible. However, the quest for the ultimate reading goes far beyond this practical concern and into the metaphysics of the musical work.

By progressively relieving historical works from their sources and gradually uncovering the underlying “work”, historical editions contribute to the establishment of a *musical canon*. This canonizing effect—anticipated in the moment a decision is made to edit the work of a certain composer and not somebody else, and to edit certain works within the corpus of this composer and not others—can be avoided in a new approach to the sources, in the age of digitization and digital media.

In the case of Johan Svendsen, any version of his collected works will have to relate to the question of a Norwegian canon. The Svendsen edition could be the first step in a long awaited revaluation of the role of music in what is often referred to as the Norwegian Golden Age—the age of Ibsen and Grieg. Svendsen’s position in this context is somewhat ambiguous and his contributions to this heritage not easily subsumed under the usual banners.

The new edition will include music that do not necessarily support the prevailing picture of Svendsen as a representative of National Romanticism, such as his unpublished dances and marches for orchestra, written for the mid-nineteenth-century entertainment scene in Christiania, the celebratory cantatas and marches commissioned for political events in Norway and Denmark.

4. The Return to the sources in Music Edition

Source-based research in general can be an effective means to recontextualize historical art encumbered by ideologies of later times. Although critical edition—the source-based discipline *per se*—is inevitably involved in canon construction, it may also have the power to change our view of history.

In this, it would answer a call in present day scholarship for a new return to the sources and new attention to the materiality of the cultural heritage.

Obviously, the renewed interest for sources and materiality in the humanities finds an ambiguous allied in digital technology. Digitization speeds up the publication and dissemination of historical documents, but in the process they are stripped of their physical and material form, their *historical* form. The specific nature of traditional materials such as parchment, paper, vinyl, magnetic tape and so on is lost, as is the physical, corporeal quality of specific media such as the book, the map, the record and the musical score. But the notion that remediation does not alter or influence the message, and that the message remains the same no matter which material form it assumes, seems very deep-rooted.

The materiality of the cultural heritage has become the object of renewed interest in critical thought and historical research. If the digital media of the 21st century and their power to transform practices and experiences attract scholarly interest, so do the analogue media of previous centuries. There is a growing awareness that historical documents and artefacts do not only communicate a coded message but also

possess a material presence. To read a historical document on the screen may give you the content of its message, but to hold it between your hands is to face the unknown or forgotten.

Book history is one of several new fields of research in which the meaning of materiality is explored. The methods of book history draw on a variety of existing disciplines such as media history, classical bibliography and, indeed, edition philology. Book history explores the physical properties of the text in order to reveal what it says, apart from what is written in it. The binding, paper quality, typography, the illustrations, the price, the subscription list, the number printed—these are all factors that add to the meaning of the book by showing glimpses of its use, distribution, readership and status. In this way, books are made to tell stories about power, politics, economy and technology—and about marginalization and canonization.

The return to the sources seems to be felt more urgently precisely in the age of digitization. What is sought for is the new sensibility in the encounters with the source material in their concrete materiality. In the field of music, the need to return to the sources is even more urgent, since this particular field has been so thoroughly digitized.

Although the massive distribution of digitized documentation on the Internet poses some paradoxes for source-based studies, I choose here to emphasize the positive side. And although even the best scan will not be able to reveal all the secrets of the physical document, the sources sometimes seem to regain some of their mysterious presence in present days digital media.

5. Digitization and New Digital Media in Music Edition

The return to the sources of historical music is increasingly made possible by digitizing programs in the institutions that hold the material. Thanks to digitization and digital media, editors and researchers can make use of digital documentation—especially in the field of secondary sources—that in earlier times would not have come to light, or been obtained only through very time-consuming archival studies.

However, the full power of digitization and digital media lies in their potential to present the products of historical edition to the public in new and innovative ways.

On a basic level, digital web-based editions can make use of multimedia technologies that give the public a deeper insight into all details of the source material, but without renouncing the clear and playable score. Any amount of supplementary information can be made directly accessible in the text itself through pop-ups and hyperlinks. Any number of primary sources can be made available *in extenso*, in digitized form on the website, and be linked to the new edition in many ways. Different versions of the finished score can be presented to performers, and engage them in an interactive use of the edition.

Digital technologies and media offer even more possibilities in the field of secondary sources. Facsimiles of handwritten and printed material—letters, diaries, newspaper articles etc.—as well as digitized photographs, films and other documentation may be able to present a totally new picture of the works in question, and tell a new story about the genesis and history of the work. The documentation material can be arranged in interactive patterns that do not necessarily support a single interpretive perspective but allow the user to find her own path and pursue her own line of interpretation.

In this way, the historical documents will have fulfilled a quite different purpose than the occasional facsimile reproductions known from traditional editions.

Although historical edition is inevitably a selective process guided by interest, the canonizing effect can be controlled by employing resources that emerge from the digitizing process itself. Digital music edition, presenting the edited work in digital form on the Internet, may feature any number of digitized

sources and a wealth of other digital resources that provide documentation for the creation of the work as well as its history of performance, publication and reception. In this way, digital editions give new possibilities for studying the processes of canonization and marginalization themselves.

6. Historical Music in the Digital Public Sphere

The new potential to recontextualize historical documents is the result of a media situation in which information and communication, experiences and entertainment circulate in new ways. New digital media bring about changes of perspective and altered sensibilities. They create a public sphere in which traditional mechanisms for establishing musical repertoires are transformed or replaced. The institutions, venues and media that have traditionally made up the public sphere have not been able to sustain their traditional roles and positions. The conditions for the formation of historical knowledge are changing, and new mechanisms for canonization and marginalization arise.

New digital media have brought about a revolution in production and distribution of music, including historical music of all kinds. The prominent role of music in contemporary media culture—digital dissemination of sound and images and other forms of documentation, including sheet music—represents a new and more unpredictable context for editing historical music. In the time to come, any ambition to present authorized versions of historical works and thus to define a canon, seems to be limited.

Digitization and digital media bring about fragmentation but also democratization. This ambivalent situation involves a particular responsibility for researchers and publishers. As historians, we have an obligation to not just preserve the permanence, authenticity, identity and integrity of the historical documentation that we present, but to open a space for their interpretation.

Developing and Implementing a Digital Video Repository for Legacy Dance Documentation

Dance Heritage Coalition's Secure Media Network

Lauren Sorensen¹ and Tanisha Jones²

¹Bay Area Video Coalition, USA; ²Jerome Robbins Archive of the Recorded Moving Image, The New York Public Library for the Performing Arts, USA

Abstract

The Dance Heritage Coalition and Bay Area Video Coalition are collaborating on a Mellon Foundation funded project to digitize, preserve, and make accessible analogue and digital tape-based materials of key importance to dance heritage. In creating a digital repository, materials are managed using a suite of tools and standards, including OAIS standard (ISO 14721:2003); the project currently involves moving from Fedora to Archivematica repository software, and custom software tools for file analysis and digital collection management. The goal of this paper is to outline the technological and workflow related challenges faced in implementing and building the repository, focusing on those related to audio-visual preservation, and specifically addressing challenges in building an archival workflow without documented standards of practice for digitization of analogue and digital videotape in the moving image archiving and preservation field.

Authors

Lauren Sorensen is Preservation Specialist at Bay Area Video Coalition, and co-chair of the Association of Moving Image Archivists' Independent Media Committee. Previously she has held positions as Assistant Director at 16mm film distributor Canyon Cinema, research assistant for Preserving Digital Public Television, an initiative of NDIIPP (National Digital Information Infrastructure and Preservation Program), and has acted as preservation consultant for a number of independent film and video collections. Lauren holds an M.A. from New York University in Moving Image Archiving and Preservation. In her current role at BAVC, Lauren manages digitization, technical development, and documentation of the Secure Media Network.

Tanisha Jones serves as Director of the Jerome Robbins Archive of the Recorded Moving Image in the Jerome Robbins Dance Division at The New York Public Library for the Performing Arts, and has worked in the Dance Division since 2007. As of 2009, Ms. Jones is Consultant to the national non-profit alliance organization Dance Heritage Coalition's Secure Media Network project, which aims to provide secured access of digitized archival dance materials from various national dance collections, archives, libraries, educational and research centers. Additionally, Ms. Jones has presented her work at professional conferences and organizations such as the American Library Association (ALA), Association of Moving Image Archivists (AMIA), Joint Technical Symposium (JTS), and the Archivists Round Table of Metropolitan New York (ART). She served on the Board of Directors of the New York-based nonprofit organization Independent Media Arts Preservation, Inc. (IMAP) from 2005 – 2009, and since 2009 is on IMAP's Advisory Council. In 2011, Ms. Jones was an adjunct professor in Tisch School of the Arts' Moving Image Archiving and Preservation (MIAP) program at New York University; the program from which in 2005 she received her M.A. as a graduate of the MIAP's inaugural class.

1. Introduction

The Dance Heritage Coalition and Bay Area Video Coalition are collaborating on an Andrew W. Mellon Foundation funded project to digitize, preserve, and make accessible analogue and digital tape-based materials of key importance to dance heritage. In creating a digital repository, materials are managed using a suite of tools and standards, including OAIS standard (ISO 14721:2003) based systems FEDORA and now moving to Archivematica repository software, and in navigating the transition between a Fedora system, using custom software tools for file analysis and digital forensics specific to moving image video files.

Dance Heritage Coalition is the sole national non-profit alliance of institutions holding significant collections of materials documenting the history of dance. Its mission is to preserve, make accessible, enhance and augment the materials that document the artistic accomplishments in dance of the past, present, and future. The DHC was founded in 1992 to address problems in documenting dance and preserving the record, problems which were identified in a study commissioned by The Andrew W. Mellon Foundation and the National Endowment for the Arts. This study, titled *Images of American Dance*, recommended the formation of an alliance of the nation's major dance collections to facilitate communication; develop national standards, policies and priorities; and implement collaborative activities and projects in the fields of dance preservation, documentation, and access. In keeping with this history and mission, in 2009 the DHC embarked on an ambitious project to preserve and make accessible vital dance documentation, rare performances, and other notable works via a digital preservation repository of moving image materials as well as a corresponding web-accessible repository available on-site at DHC member archive institutions.

2. The Problem: Deteriorating Carriers for Moving Image Dance Documentation

Analogue videotape is a commercial storage medium initially used in television production and broadcast contexts starting in the 1950s with 2" Quadraplex videotape. In subsequent years, videotape in other forms became widely used as an affordable format for artists, and quickly shifted to consumer applications as well. Performance documentation starting in the late 1960s was documented on the Sony Portapak, one of these affordable means to record video. Subsequently, for the dance community, many dance companies, dancers, dance studios and festivals used this affordable, consumer videotape over the course of many years; the materials within DHC member archive collections, according to the Secure Media Network union catalog (publically available at <http://archive.danceheritage.org/>) are in the range of mid-1960s to the present. While analogue videotape continued to become less and less expensive, the formats developed were never consistent; they relied on a company or commercial entity to maintain and manufacture equipment, and as soon as new developments in technology occurred, a new format was born replacing the old which was then no longer supported by the company producing the videotape and videotape playback machines, which created opportunities in quality and technological advancement but challenges for sustainability. Non-profit organizations such as dance institutions saw opportunities to document practices, rehearsals, dancers in these formats and so subsequently, looking at these collections, archivists and subject specialists can see that this practice was incredibly valuable to the history of dance. However these carriers of vital documentation and history face a lifespan of just 15-20 years under *ideal* temperature and humidity, a practice which is oftentimes outside the purview of non-profit organizations, and so as a result these valuable assets become a high priority for preservation purposes.

The Dance Heritage Coalition identified this as an issue concerning dance legacy: analogue video assets are the most at-risk, endangered by obsolescing equipment, physical deterioration, and their key importance to ; a three-fold relevance to what the project wants to support, and the DHC board chose BAVC as a partner because of complementary interests in pursuing open-source standards and creating a community around preservation of analogue video for under-served organizations like non-profits and artists. BAVC has developed a standard and accepted workflow for preservation of analogue media assets that would be adopted by Dance Heritage Coalition digitization hubs around the country, giving the organization the opportunity to pursue preservation without the need for a vendor in all cases. Preservationists determined that the most at-risk videotapes would be handled in-house by BAVC, as many times they require expertise that is not transferable to digitization fellows who would be handling digitization of materials that are less susceptible to factors such as sticky shed syndrome, and particularly fragile equipment.

The project also incorporated choosing and developing a plan for using repository software to manage the assets; up to now, we have been using a system of command line software tools to ensure integrity of the files and our own initially FEDORA-based, documented system for creating Submission Information Packages.¹ A project goal was to make our SIPs as robust as possible given that the system is being “incubated” and developed at BAVC, and that this system will move to a DHC partner organization, perhaps with a different infrastructure, it was important to employ a well-documented and flexible Open Archival Information System² compliant system that would then be easily navigable when the system moves to another organization.

Since many dance companies, festivals and other organizations and artists producing videotape content used consumer videotape formats to document performances, rehearsals and other important dance related documentation, many of these materials have ended up in cultural heritage institutions charged with preservation of artists’ records, dance companies archival materials donated include such materials and so on. However, many of these institutions, while charged with the preservation of these videotape formats do not have the facilities, technical knowledge base and resources from which to actively preserve these important works; Dance Heritage Coalition identified this issue in many of their constituent organizations’ collections and took up the challenge to draw resources around this issue and pull technology and archive partners together to come up with a solution, and develop and build a digital repository for digitized moving image materials comprised of dance documentation from partner archive organizations.

3. How can a non-profit organization establish and sustain a digital repository?

The goal of this paper is to give a case study and outline several challenges in the project, which is currently in the late discovery phase. During the course of this paper we will go into detail in these areas of the project’s development: *Developing a Union Catalog*, *Metadata Standards*, *Workflow Development*, *Digital Preservation of Moving Images* and *Building Geographically Diverse Digitization Hubs & Digitization*.

¹ “Reference Model for an Open Archival Information System.” The Consultive Committee for Space Data Systems. CCSDS 650.0-M-2 <http://public.ccsds.org/publications/archive/650x0m2.pdf> (Accessed 08-01-2012)

² Ibid.

4. Developing a Union Catalog, Metadata Standards, Workflow Development

The first goal of the project was to gather catalog records and build a catalog resource for researchers and archives' access online and for access to the DIPs (Distribution Information Packages). Next, we refined and documented BAVC's own analogue videotape preservation workflow to plan for and develop workflow for digitization hubs in DHC partner institutions, and find a way to support that infrastructure. Developers on the project reviewed the goals and developed a collecting policy which outlines the content and factors around choosing elements for preservation and named constituents and user profiles such as submitting archives, users and so on. This gave the project a basis for reviewing and then developing technical goals for the SMN that ended up speaking directly to the collecting policy.

The digital age gives cultural heritage institutions and institutions options opportunities but also so many choices that, in order to become meaningful and sustainable long-term must be strategically made. The SMN project has functioned with this in mind—building out a system where the goal is to be flexible and sufficiently documented to be sustainable moving forward. The project took on the standard OAIS structure (Open Archival Information System model) standard for digital archives as a basis for developing the project, see Figure 1 for a visual model of the system. The system is currently transitioning from FEDORA to Archivematica system.

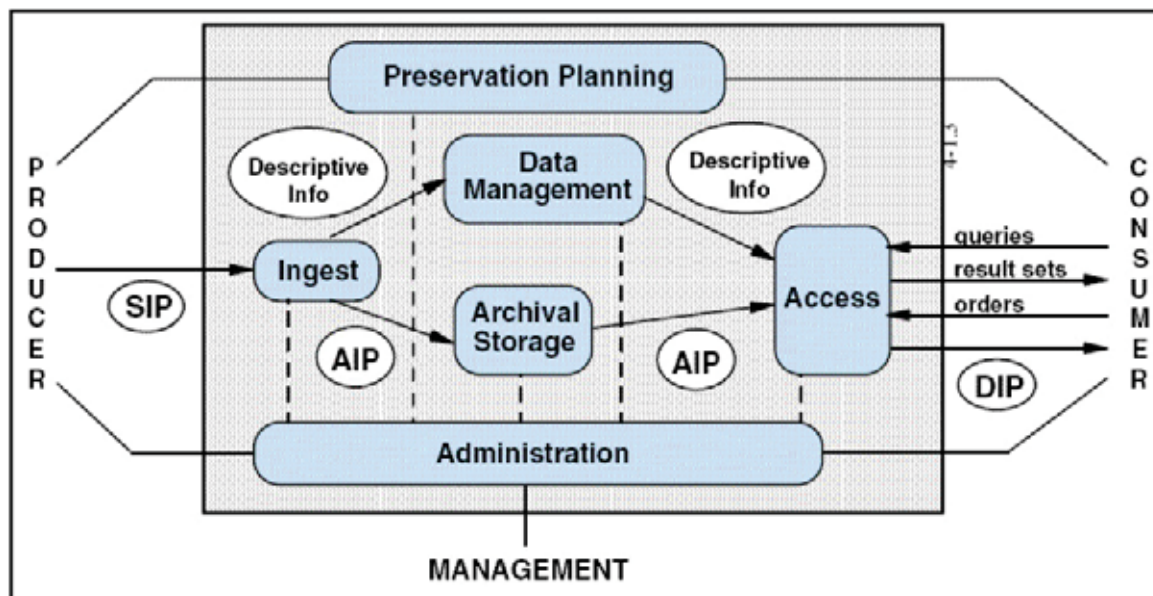

Figure 1. Open Archival Information System (OAIS) Model.

During this development and discovery phase, the SMN access and preservation repositories are located at Bay Area Video Coalition, a 35 year old non-profit based in San Francisco known for its work as a non-profit center for analogue video preservation; the digital repository development component and metadata maintenance would be managed by David Rice, consultant and technologist currently an Archivist for City University of New York, formerly of AudioVisual Preservation Solutions and WNET.

The project began with many of the usual issues seen by not-for-profit organizations in the United States: limited funding, organizational infrastructure that is largely reliant on grants and a shoe-string budget; a staff of one whose main job description involves grant writing and project management. So the

collecting policy and plan that was made had to include partner archives' active involvement and real collaboration as an alliance of archives. One of the questions early on involved obtaining item-level metadata records from submitting institutions' archives own cataloging efforts. This would then allow access for researchers and provide a central location where archivists from existing institutions could access records from partner organizations and researchers could see where dance documentation double as a place where Distribution Information Packages, in the form of streaming video files would live and be accessible via research request practices at individual DHC member organizations. The structure was well suited because for the project would include different instantiations of one asset; a feature supported by Public Broadcasting Core, the schema that was used as the basis for this web-based application. Our hope was that FEDORA could operate as a repository software tool for the project, however the large file sizes required by the project were not workable with FEDORA; this led us to talking with colleagues and approached Archivematica as a possible solution for our large file size maintenance. Currently we are developing a plan to transfer our current FEDORA based SIP structure to Archivematica SIP structure; learning in the process how important the skillset of working in a command line environment can be for a digital preservationist or collection manager. With a great support for file fixity checks as well as an easy-to-use interface, as well as collegial experience using the Archivematica suite of tools with larger file formats, we feel confident that this move will be a positive addition to project. In the past, working with FEDORA, the repository software was only able to "point to" the files instead of actively manage them; unfortunately a ticket put in to address this issue of problems related to large files has not been addressed since 2009.³ Our own testing found that the upload progress lagged and never completed upon upload of large (50 gigabytes or more) files.

5. Digital Preservation of Moving Images

Digital preservation in general is a challenging topic because of a variety of different factors, including openness, sustainability; but digital moving image preservation creates a number of even more challenging variables, including a consistent file format choice for analogue-to-digital preservation; large, high quality file management by institutions that may have technology personnel accustomed to smaller files managed on servers, such as documents or compressed video; lack of standardization in the moving image preservation field, fixity issues made more challenging by large file size; storage capacity and relationship between the need for preservation and not-for-profit budgets; infrastructure and administration and complex copyright challenges.

Digital preservation of moving images is a facet of a larger field, and this project gave BAVC and DHC the opportunity to approach challenges related to developing procedures and protocol around file-based digital moving image preservation. In the course of pursuing analogue video preservation, we learn that in this context, traditional archival principles had to shift, especially in terms of authenticity; keeping an artefact its original form essentially relegates the content contained therein to the wastebasket because of analogue media's unstable carrier. Kenneth Thibodeau introduces his article for CLIR, "Overview of Technological Approaches to Digital Preservation and Challenges in Coming Years," by using a decidedly analogue example: the periodic table; this example is meaningful not only by the content but by the structure; much like moving images which are not only visual images but visual images with a specific frame rate, in a certain colour space and so on. Because of the technological challenges we may

³ FEDORA Commons Wiki"2009-06-09 - Special Topic - Large Datastreams."
<https://wiki.duraspace.org/display/FCREPO/2009-06-09+-+Special+Topic+-+Large+Datastreams>.

not see that we can preserve not necessarily the exact form of that periodic table but the characteristics of it that make it meaningful. He states:

The periodic table was created a century before computers, and it has survived very well in analog form. Thus we cannot say without qualification that the variety and complexity of digital objects must always be preserved. In cases such as that of the periodic table, it is the essential character of the information object, not the way it happens to be encoded digitally, that must be preserved. For objects such as the periodic table, one essential characteristic is the arrangement of the content in a 2-by-2 grid. As long as we preserve that structure, we can use a variety of digital fonts and type sizes, or no fonts at all—as in the case of ASCII or a page-image format.⁴

So how do we go about determining what is the essential character of a digital object, or its essence from the analogue source (or in the case of DV, the data contained on the tape carrier), and therefore what to preserve? And then, what do tools are needed to preserve that essence?

6. What is the essential character of the object being preserved that the preservation system, digitizing technicians, and workflow will need to support?

After need was identified, BAVC embarked on a study published by the American Conservation Institute's Electronic Media Group that examined what codecs are appropriate for the preservation of dance documentation from an analogue source. The goal of the paper was choosing a best format for the project, but also act as a case study. What codec could work the best for a preservation repository of this kind, and what characteristics of the original analogue source would be preserved with accuracy?

The Secure Media Network requires archival quality digital files to be stored in a digital repository well as streaming video to be viewed—because of copyright restraints—within the walls of the member organizations. In the spring of 2009, in preparation for this undertaking, BAVC performed this study to evaluate current commonly used codecs for the reformatting of analogue video videotape. Nine participants were selected for this study. The participants included video professionals, colorists, archivists, and a dancer. In addition to informing our decisions regarding codecs for the Secure Media Network, BAVC hopes that this study will provide an additional data point and case study for archives and other organizations to consider when planning their inevitable migration to digital files. Each participant spent about two hours comparing video clips. The participants were asked to note the following:

1. Visual difference between clips. Was any difference noticed?
2. Compression artefacts observed. Compression artefacts include blockiness, blurring, etc. Because these codecs are considered to be production quality, these artefacts were expected to be minimal.
3. Chroma reproduction. Were there any shifts in hue or chroma level from one clip to the next?
4. Luminance reproduction. Were there any differences in luminance from one clip to the next?
5. Any other artefacts. Were other differences noticed?

⁴ Thibodeau, Kenneth. "Overview of Technological Approaches to Digital Preservation and Challenges in Coming Years," CLIR and the Library of Congress, *The State of Digital preservation: An International Perspective*, April 2002.

Answers to these questions were noted by the operator and are included in the report published in the Electronic Media Review, Vol. 1. Overall, most participants noticed major differences only in the H.264 files and the IMX files. Some participants, even between 8-bit and 10-bit uncompressed files, noticed minor colour differences but all stressed that it was very difficult to see these differences and were very subtle. Time base correctors, playback equipment or monitor issues can also introduce these types of colour changes. In general, artefacts such as blockiness, blur or motion artefacts were not seen when comparing 8-bit and 10-bit uncompressed files, but were seen in H.264 files. The artefacts that were seen were subtle “softening” in varying degrees on certain clips and a reduction in apparent noise, which led some participants to conclude that the compressed file was “better.” Since lower quality analogue sources were used, most of these tape formats exhibit signal problems which can be difficult to distinguish from other artefacts that may be introduced by digital compression. Based on this study, BAVC recommends 10-bit uncompressed files for any visually significant recording; the case for performing arts documentation. These lossless high quality files are also useful in any future transcoding that may need to occur for preservation purposes of the digital files; lossy codecs, when transcoded lose information and result in poorer image quality and loss of information moving forward.

10-bit uncompressed files coming from an analogue source, must fit within a certain video bandwidth so to align these results with we have to purchase capture equipment that will align with these requirements and choose a format to digitize and capture to that will adequately represent the picture. A chart developed for the Conservation Online web site, maintained by American Institute of Conservation’s Electronic Media Group was useful tool in evaluating this along with capture card specifications.⁵

Specifications for the files formats from an NTSC analogue source can be found below:

Video essence

Audio essence

File extension: *.mov or *.avi			
Format (wrapper) profiles: Quicktime or Audio / Video Interleave			
Codec & Codec ID	YUV v210, AJA Video Systems Xena	Codec & codec ID	PCM
Bit rate mode	Constant	Bit rate mode	Constant
Bit rate	224 Mbps (approximate)	Bit rate	2300 Kbps (approximate)
Original width	720 pixels	Channel(s)	Up to 4 channels
Original height	486 pixels	Sampling rate	48.0 KHz
Display aspect ratio	4:3	Bit depth	24 bits
Frame rate	29.970 fps		
Standard	NTSC		
Colour space	YUV		
Chroma subsampling	4:2:2		
Bit depth	10		

The metadata relating to the digital object, once processed for ingest includes metadata from Mediainfo, an open-source tool that also allows for checking of file characteristics, like those above. PREMIS is also

⁵Conservation Online. “Range of Video Formats,” http://videopreservation.conservations-us.org/dig_mig/video_formats_v4_850.html (Accessed 2012-07-08).

mapped from Mediainfo, so this tool is used for multiple purposes: digitization fellows are trained to review this information to confirm aspects of the file requirements are in line with what was produced. It is also mapped using command line tools to PREMIS, a metadata standard used in many digital repositories.

Our project also utilized a frame-by-frame checksum reporting command line tool which allows users to check frame by frame checksums which is helpful for fixity purposes through the software application ffmpeg. What are checksums? David Rice, our project technologist and metadata specialist wrote an article in a recent IASA (International Association of Sound and Audiovisual Archives) journal titled “Reconsidering the Checksum for Audiovisual Preservation: Detecting digital change in audiovisual data with decoders and checksums” and provides this outline:

A checksum is small data value computed from a given amount of data, such as a file or bitstream, for the purpose of facilitating the future ability to detect changes in that given data. The generation and verification of checksums for digital archival holdings is a central principle of digital preservation and enable archivists to trust that data held within an archive is the same data that was received by the archive. Although checksum wrangling is typically a behind-the-scenes process within digital storage systems and repositories, these values are worth a closer look. The checksum value is generally expressed in hexadecimal representation (aka base 16) comprised of the numbers 0 through 9 and the letters A through F... [If a] file changed, whether through manipulation, bit rot, or data corruption, then further evaluations of the file would produce a different checksum value. The mismatch of a newly calculated checksum and a stored checksum produced earlier is an alert that data under care has been changed.⁶

Technicians create an MD5 checksum upon completion of digitization; this is reviewed following transmission of the SIP to the collection manager, and Archivematica uses MD5 checksums as well. Because the files that result are so large (an aspect which will be reviewed later in this paper) submitting a SIP over a network is not possible for many non-profit organizations. So we submit SIPs by mailing hard drives from the digitization hub locations to BAVC, where the repository lives; please see Figure 2 for a picture of the SMN workflow. Additionally, once a SIP is ingested into the repository, an application called rsync is used to copy the files from the on-site server controlled RAID to an off-site data center which houses another server controlled RAID (formatted as RAID 5). Rsync then generates reports that the collection manager may review for digital object maintenance outside of the repository structure in order to determine if any changes to the digital objects have occurred and take steps to repair or address the issue from there.

The access repository is separate, but managed in the same suite of scripts that create a fully realized SIP following digitization by hub technicians. It is the same interface as the union catalog, a PBCore database that was originally developed by Roasted Vermicelli LLC for the WNET Digital Archive. It was further developed in 2009–2011 for the Dance Heritage Coalition Secure Media Network and graphic design was handled by Blue Griffin Design Company. In keeping with the not-for-profit institutional context for this repository project, the program is free software: it can be redistributed and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or any later version, and is held under a GNU license. Code

⁶ Rice, David. “Reconsidering the Checksum for Audiovisual Preservation: Detecting digital change in audiovisual data with decoders and checksums” IASA Journal 39 (2012).

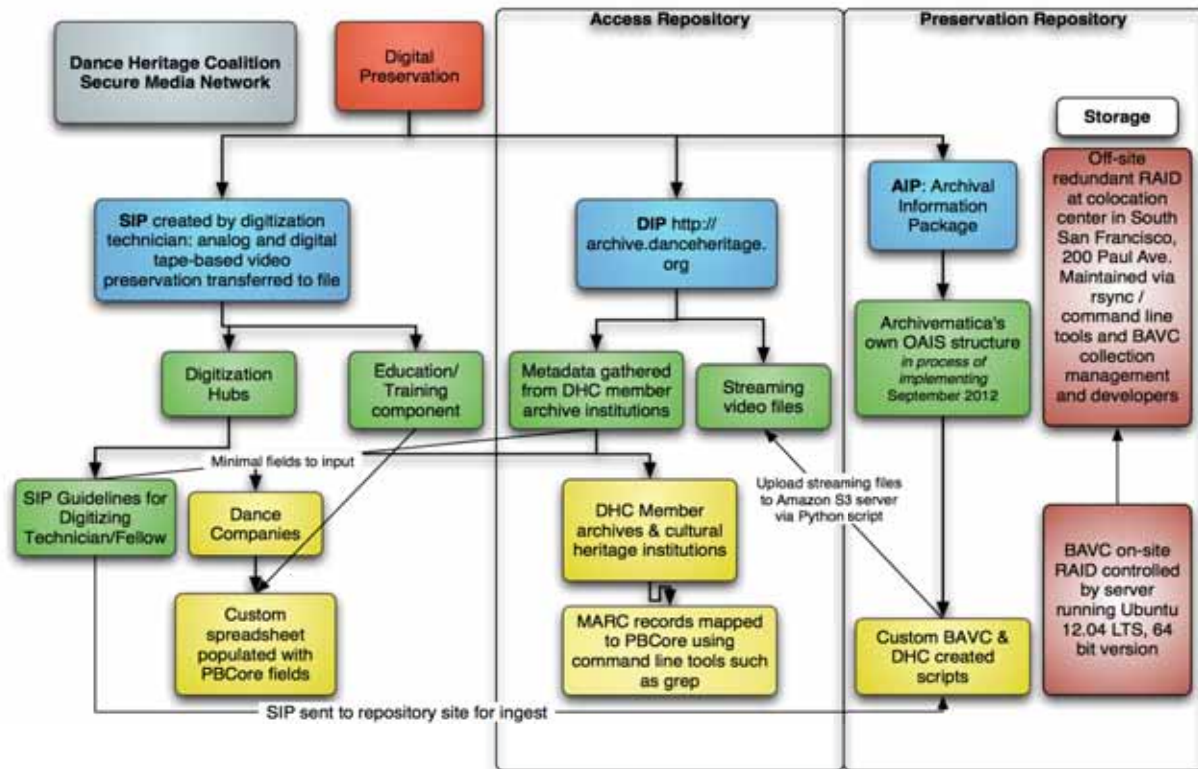

Figure 2. Digital Repository Workflow for DHC Secure Media Network.

in the vendor and gems directories of this project was created by other authors under potentially different Free Software licenses. This work employs PBCore. The PBCore (Public Broadcasting Metadata Dictionary) was created by the public broadcasting community in the United States of America for use by public broadcasters and others. Initial development funding for PBCore was provided by the Corporation for Public Broadcasting. The PBCore is built on the foundation of the Dublin Core (ISO 15836), an international standard for resource discovery, and has been reviewed by the Dublin Core Metadata Initiative Usage Board. Copyright: 2005, Corporation for Public Broadcasting. This software is powered by Ruby on Rails, Apache Solr, MySQL, nginx, and other third-party modules.

This application works well for inputting metadata because of the web-based interface. Protocols for which fields were required are outlined in the project's SIP (Submission Information Package) guidelines, a resource and training tool for digitization fellows who preserve materials at member archive hubs (see Figure 2 for a visual on where these hubs fit into the over-arching workflow of the project). However, since the project has developed, the application is no longer supported and features are no longer being handled by developers, so the SMN will likely shift to work within another CMS, such as Drupal with modules that support XML and streaming video. We are hoping for another form-based user interface for metadata input and mapping which will continue to allow ease of use for our digitization fellows to handle. There is a newer version of PBCore standard (2.0) which developers on the project are working on mapping from PBCore 1.3.

7. Building Geographically Diverse Digitization Hubs & Digitization

Next the project focused on implementation of digitization “hubs” or small centers within DHC member organizations around the country where digitization fellows with either a background in preservation and archiving or video production would create digital objects from an analogue source, preservation and technical metadata and supply Submission Information Packages for the SMN digital repository. These hubs are largely small workstations within non-for-profit DHC member archives, and BAVC preservationists as well as on-site staff provide supervision and training; fellowships are often helpful in growing skillsets for these archivists but also in providing feedback on the project more generally; the goals of the project grew to incorporate an education component that has proved vital to the project’s development on the whole.

Submission Information Package guidelines were initially based on FEDORA requirements and include detailed guidelines around preservation of analogue video; an at times slow process which involves identifying risk factors and real-time supervised transfer; because these materials have an estimated lifespan of less than 15 years, the risk for deterioration and aging playback machines, BAVC additionally is providing the digitization end of the repository project with general guidelines, protocol and contacts for engineers around the country who would be perhaps able to repair and maintain the obsolete equipment in use by digitization hubs. These engineers are becoming more and more difficult to locate and the hope is that through development of this project and adding new digitization hubs we will be able to make contact with more experts in this field and glean important knowledge while putting them to work in maintaining this aging equipment.⁷ The guidelines also provide information on identifying formats, inspecting analogue videotape, terminology and expected outcomes in terms of digitization package creation for submission to the SMN. Since the SMN is going through a transitional phase for our preservation repository from FEDORA based system to one built on Archivematica, we are now updating the guidelines to reflect this shift. Additionally, dance companies and studios’ with “default” archives are submitting tapes for the SMN archive, and so much of this material will be handled via simple spreadsheet input and the fellows will then create new records within the PBCore application—for the purposes of the access repository but also for identifying the asset to be digitized and starting out the workflow in a consistent way.

For our second digitization hub, at the DHC member archive, the Dance Notation Bureau in Manhattan, New York the project took a slight shift; digital videotape was introduced and a Linux-based system was developed and a preservation fellow was trained. DV, unlike analogue video is already comprised of data, bits, only on tape form. David Rice while at consulting firm Audiovisual Preservation Solutions, published a white paper⁸ referring to DV as an at risk medium, and identifying the need to transfer data off of the tape; he then developed a tool called dvanalyzer; this tool was implemented as a quality control tool and incorporated into our technician guidelines for the project.

Incorporating DV format, we saw this as an important step for diversifying the media held by the repository. While there are very specific standards for analogue sources, we want to make sure any digital

⁷ As a skillset, videotape playback equipment repair is becoming fast as obsolete as the equipment, in fact some archivists and preservation activists have worked on projects to document and record oral histories with these experts – some of these resources can be found through the Experimental Television Center’s web site Video History Project (<http://www.experimentaltvcenter.org/history>).

⁸ Rice, David and Chris Lacinak. “Digital Tape Preservation Strategy: Data or Video?” <http://www.avpreserve.com/dvanalyzer/dv-preservation-data-or-video/> (Accessed 2012-08-02).

source ingested is evaluated on its own characteristics; DV for example, is an open standard codec and even though it is lossy, it is widely adopted and any transcoding to our analogue standard would result in “empty bits” or a bit depth that is higher than what is represented visually, and perhaps an inauthentic colour space. More information on this topic can be obtained from “Digital Tape Preservation Strategy: Data or Video?”,⁹ and working with Archivematica allows us the flexibility to work with different types of preservation standards.

SIP packages from the digitization hub centers are then sent via hard drive overnight service or 2-day to the repository center, currently at BAVC. This is where custom scripts are run on these SIPs to prepare them for ingest; moving forward the intention is to train staff at digitization hubs to develop skillsets to implement this preparation work moving forward, however this will likely have to happen after Archivematica 1.0 is fully implemented. Upon ingest, following checksum review, the SIPs are copied to a server running Ubuntu Linux 12.04 LTS and then the rsync command is used in concert with the cron command and various specific specifications to copy the SIPs nightly to the off-site server storage at a data center in South San Francisco. Due to the large size of the files we are working with, it was important to choose an off-site data center where BAVC’s city-implemented fiber connection could be utilized. This aspect will have to be re-evaluated once the project incubation period is over, as fiber is not a common nor cost-sensible solution for many non-profit institutions.

8. Conclusion and Next Steps

The SMN is a project that has a lot of potential moving forward for the dance community and highlighting dance heritage within the digital archives community. The next steps involved in the process have to do with implementing many of the recommendations related to the TRAC (Trustworthy Digital Repositories Audit & Certification) checklist. From a technological standpoint, the checklist remains useful in providing the project with context and recommendations for a framework moving forward; another goal is evaluating and re-evaluating financial sustainability, support for a large technological infrastructure, and continuing the initial goal that set the project to start, namely preserving deteriorating and obsolescing audiovisual media. The OAIS standard was also recently updated, and once our repository software is implemented fully, the project plan is to document using a Use Case model every step of the standard as another auditing procedure and way to document for future caretakers of the collection; Archivematica has done a version of this Use Case, however since our model includes several custom, audiovisual specific workflow steps, we intend to amend it.

Moving forward, Archivematica 1.0 will be implemented early next year, having created from their systems a new way of forming our ingest SIP packages; and creating our custom scripts, some altered from some Archivematica micro-services detailed in Figure 2, which gives a larger picture of our overall transition from FEDORA to Archivematica. Having met with colleagues at the City of Vancouver archives who work with losslessly compressed video in the context of Archivematica, our hope is that the microservices chosen and the option for normalization will give us sustainable and flexible options moving forward in working within the Archivematica system. We also hope that this project results in more traction and conversation around pursuing preservation of analogue videotape assets in archives, and what digital preservation can mean for historical documentation on these rapidly decaying carriers of moving image heritage.

Abstract

The communication outlines the importance of the safeguarding of the Portuguese Language documental heritage. During some conventions, information professionals and researchers jointed to discuss about difficulties and requirements and planned together information strategies, as the Letters of Aveiro and Sao Paulo, the IFLA- Portuguese Caucus, the Lusophone Forum of Archivists and professional training. In 1996, the creation of the Community of Portuguese Language Countries (CPLP), joints eight countries to deepen mutual friendship and cooperation to achieve common objectives. The Informational Policies of the organization structured initiatives for safeguarding of the common cultural heritage, in which documentation as a remarkable position. Till now, most of the digitization and preservation projects are Portuguese and Brazilian. A number of the them are briefly described and they mainly consists in digital programs in different areas of knowledge such as the Health Information Network in Portuguese, ePORTUGUESe, formalized in 2004, and supported by the World Health Organization (WHO), to promote information networks and the creation of the Global Health Library; the Lusophonia Portal, a forum, about the Industrial Property in the Lusophone countries, where you can find, since 2007, a virtual library, the LUSOPAT database and another data of cooperation; the Information Center on Social Protection (CIPS), responds the information needs and experiences of social protection of the CPLP countries, created in 2007, by the Executive Secretary of CPLP, the International Labor Organization (ILO)-Lisbon and STEP Project/ Portugal; the Legis PALOP, born in 2008, containing a platform to provide and share legal information and knowledge among African Countries of Portuguese Official Language (PALOP), developed by the Regional Indicative Program PALOP II, funded by the 9th European Development Fund (EDF) and the Portuguese Institute for Development Support (IPAD). The presentation ends up with a recent initiative, result of a doctoral thesis, containing a methodological guide for the implementation of the Lusophone Digital Library (BDL), a free access portal to digital content of the collections of Lusophone National Libraries. The objective of this contribution is to safeguard the documental heritage, democratize the access to it, increase awareness of its significance and distribute, on large scale, products derivate of it, develop the integration of the Lusophone countries in the knowledge society and promote the Portuguese language in the cyberspace.

Authors

Fernanda Maria Melo Alves studied at the Eduardo Mondlane University in Mozambique, at the Higher Institute of Languages and Administration, and the Universities of Lisbon, Autonomic and Open in Portugal, and at the Carlos III University of Madrid in Spain. She taught Portuguese and French language and culture in Portugal and, in 1998, joined the Information Science Department, at the Carlos III University of Madrid, in Spain, as a researcher, teacher, and manager of international cooperation projects with Lusophone African countries. And she also collaborates with the Cathedra of Portuguese Studies Luís de Camões, at the same university. She has participated in national and international meetings and published in scientific journals. She also works as translator and interpreter, collaborates in NGOs projects, and is president of International Association of the Lusophone Digital Library, located in Portugal.

José Antonio Moreira González has worked in the Universities: UNED (1982-1986), Complutense (1986-1989), Murcia (1989-1991) and Carlos III of Madrid (from 1991). His teaching and investigation attend to the analysis of documentary content, the semantic vocabularies, the documentary theory and the labor market in Information-Documentation. He has participated in two European projects, directed or collaborated in seven of the CICYT, four of the Community of Madrid and five PCI of the AECID. Twenty two doctoral theses were directed by him. He has collaborated like visiting professor in forty universities abroad, seven of them in extended stay.

José Manuel Matias studied History in the University of Lisbon and got an MSc in African Studies at the Lisbon Higher Institute of Social Sciences and Labor (ISTEC). He worked as advisor of the Ministry of Education of Mozambique, from 1975 to 1977. He taught History in secondary education in Lisbon, from 1977 to 1993, later at the Zimbabwe University, from 1993 to 1998, and at the Agostinho Neto University in Angola, from 1998 to 2000. He worked as advisor for cultural and linguistic cooperation with Africa in the Instituto Camões, from 2000 to 2007. He participated in international congresses and symposia about African Studies, and is vice-president of International Association of the Lusophone Digital Library, located in Portugal.

1. Safeguarding in the Digital Age: digitization and preservation planning

All areas of life produce digital documents and the digital documentary heritage, born digital or digitalized traditional documents, is an important heritage for humanity. In order to allow the universal access, the safeguard of the digital documents and digital technology concern everybody, international organizations, governments, experts, professionals and all peoples.

The Memory of the World, launched by UNESCO, seeks to preserve documentary heritage, which reflects the diversity of languages, peoples and cultures and is the mirror of the world and its memory. But this memory is fragile and every day disappears. In order to avoid this situation, the Programme proposes some principles to the preservation of archives, libraries and museums collections all over the world and ensures their wide dissemination.

At the same time, other initiatives improve this policy, like the Information for All Programme (IFAP) in 2006, which looks after a world where everyone has access to information that is relevant to them and where everyone has the opportunity and skills to use this information in creating better societies. The Programme provides a platform for discussions and action on information policies and the safeguarding of recorded knowledge, but many challenges yet remain, such as strengthening the program in all regions, increasing international and intra-regional cooperation to use ICTs for development and materialize its goals.

But resources of information and creative expression are increasingly produced, distributed, accessed and maintained in digital form, creating a new legacy, the digital heritage, that is at risk of being lost and that its preservation, for the benefit of present and future generations, is an urgent issue of worldwide concern. Consequently, UNESCO published in 2003 the *Guidelines for the Preservation of Digital Heritage*,¹ based on the experience a group working in preservation and research programs around the world, supports a variety of preservation strategies and requirements and tools across institutions and settings make the decision on which solution to implement preservation planning.

¹ Guidelines for the preservation of digital heritage (online). UNESCO, Information Society Division, 2003, <http://www.unesco.org/webworld/mdm>.

Besides, the *Charter on the Preservation of Digital Heritage* gives strategies and policies to develop the preservation of the digital heritage, taking into account the level of urgency, local circumstances, available means and future projections. The cooperation of holders of copyright and related rights, and other stakeholders, in setting common standards and compatibilities, and resource sharing, will facilitate this.

A number of initiatives to preserve digital materials have been ongoing in scientific and scholarly research, so that they are maintained and can be re-used. National libraries generally approach the digital environment from the angle of deposit legislation and several libraries have developed strategies for actively selecting and preserving websites, and some national archives have extended policies for electronic record management to include websites of government agencies, public sites and intranet sites, and developed guidelines describing best practices. Other institutions are focusing on collecting materials in a specific subject.

However, as few countries have adopted a national policy regarding digital information and most decision-makers has no sensibility for the problem or are not informed about the risk of disappearance of commonly used means of transmitting and storing digital information.

2. Portuguese Language: Past, Present and Future

Portuguese navigations began by the mid-1500s, and the Portuguese controlled, during centuries, some colonies all over the world.² The Portuguese Empire was motivated by economic, mercantile, political and strategic interests, allied to a certain cultural and scientific curiosity and an attempt at evangelization. The process of colonization encouraged the miscegenation and the colonial education system improved the use of the Portuguese language.³

Following the Second War World, and after the long process of European colonization, most of the European territories gained their independence. But, despite armed struggles, only after the Democratic Portuguese Revolution of 1974, Portuguese colonies finally won independence and the Portuguese language was the major cultural heritage shared between the old metropolis and new nations.⁴

Like Brazil, two centuries before,⁵ the new governments, which came to power in new Lusophone countries, in order to achieve national unification among of numerous ethnic groups, decided that Portuguese is their official or co-official language, cultures and languages, and established cooperation in different areas.⁶

Portuguese is the official language of the following eight countries, Portugal in Europe, Angola, Cape Verde, Guinea Bissau, Mozambique and Sao Tomé and Príncipe in Africa, and East Timor in Asia, and is spoken by immigrants that live in different regions.⁷

It has been estimated about 240 million people speaking Portuguese in the world.⁸ Portuguese language is the fifth most spoken language on the planet, and the third most spoken language of the western hemisphere, after English and Spanish, and the most spoken language in the southern hemisphere. In the future, Portuguese Language speakers will grow up.⁹

3. The Community of Portuguese Language Countries (CPLP): creation and development

The Community of Portuguese Language Countries (CPLP) is inspired in others similar organizations jointed together around common languages, as English, French, Arab and Spanish, and with similar objectives, and its development is marked by sequential phases.¹⁰

The first one is a large period of the Portuguese colonization that, in the last decades, was fragmented by a new political consciousness recognizing that Portugal must finish with the dictator regime and be a free country, and the African colonies did not belong to Portugal, and the peoples of the colonies had right to freedom and independence.

Those new ideas prepared the Portuguese Democratic Revolution in 1974, the beginning of the second phase, and brought independence to the Portuguese colonies, that choired new ways of organization and development. Unfortunately, military conflicts between rival political groups devastated Angola, Mozambique and Guinea Bissau, and East Timor was invaded by Indonesia till 2002, however the new century bring peace to them, condition for the growth of the peoples. In spite of general problems and difficulties, a proposition of Brazil was accepted, and the Lusophone countries founded in 1989 the International Portuguese Language Institute (IILP).¹¹

The third phase of the CPLP corresponds to a period around the concept of the Lusophonie,¹² a cultural identity shared by eight countries and various communities in the world, united by a common past and language, enriched in its diversity. The concept got official partnership in 1996, with the creation of the Community in Lisbon, and despite a series of delays and various opinions, this moment caused great impact and had great visibility.¹³ The organization is a multilateral forum, privileged to deepen the mutual friendship and cooperation among its members, and has the following objectives:¹⁴

- The conservation of political diplomacy among its Member States, reinforcing its presence in the international scenario.
- The cooperation in all matters, including education, health, science and technology, defense, agriculture, public administration, communication, justice, public security, culture and sports.
- The implementation of projects that promote and disseminate the Portuguese language.

The foundation *Declaration*¹⁵ emphasized the development of an identity based on a common language, the Portuguese, on dialogue with other national languages and on solidarity and cooperation, respecting sovereign equality of states.

The CPLP aims to collaborate in promoting peace, democracy and sustainable development, recognizing multilateral cooperation as the most effective means to achieve these objectives, established above a strong structure in different areas.

4. Safeguarding of the Portuguese Language documentary heritage: approaches to digital preservation and the Lusophone Digital Library

The safeguarding of the Portuguese Language documental heritage, specially, digital documents, had been a preoccupation of the information professionals and researchers. During some conventions, they jointed to discuss about their difficulties and requirements and planned together information strategies, as the Letters of Aveiro and S. Paulo, the IFLA- Portuguese Caucus, the Lusophone Forum of Archivists and professional training.¹⁶

In 1996, the creation of the Community of Portuguese Language Countries (CPLP), joints eight countries to deepen mutual friendship and cooperation to achieve common objectives in different areas. The Information Policies of the organization structured initiatives for safeguarding the common cultural heritage, in which documentation as a remarkable position. Till now, most of governmental and private initiatives of digitization and preservation projects are organized by Portuguese and Brazilian institutions, which have experienced participating in international projects. We present some of them in next paragraphs.

The assignment of the ePORTUGUÊSe¹⁷ was formalized in 2004, during the Ministerial Conference on Health Research in Mexico, and is a model developed by the Latin American and Caribbean Center on Health Sciences information (BIREME) and supported by the World Health Organization (WHO), an organization that promotes information networks and the creation of the Global Health Library.

The project, born in 2004, was created for the following objectives:

- To support the development of human resources for health in the CPLP countries, strengthening collaboration in health information and training.
- To promote the development of the Virtual Health Library.

¹⁵ Comunidade dos Países de Língua Portuguesa (CPLP). *Comunicado Final da Cimeira Constitutiva da Comunidade dos Países de Língua Portuguesa (CPLP)* (online), <http://www.cplp.org/Arquivo.asp?id=5>.

¹⁶ Associação Portuguesa de Bibliotecários, Arquivistas e Documentalistas (BAD), <http://www.apbad.pt/Cooperacao.htm>.

¹⁷ ePORTUGUÊSe, <http://www.bvs.eportuguese.org/php/index.php>.

- To help the dissemination of the Blue Trunk Library in Portuguese, facilitating interaction between health institutions and contributing to the training in health.

Another example is the Lusophonia Portal,¹⁸ a virtual forum where, since 2007, you can find relevant information of the system of Industrial Property of the various Portuguese speaking countries and of the international organizations. To fulfill its mission, this forum aims:

- To contribute to the creation of the necessary conditions for the affirmation of Portuguese as a technology language in the context of the knowledge society.
- To provide a documentation center in Portuguese, which includes the LUSOPAT database, the largest database in the world of patents in Portuguese, a cooperation database to support cooperation initiatives, restructuring and maximizing their results.
- To promote effective partnership about Industrial Property.

The International Labour Organisation (ILO) launched in 2003 the Global Campaign on Social Security and Coverage for All, which conclusions were applied worldwide. In this context, the Project STEP/Portugal, the Ministry of Labor and Social Solidarity of Portugal and the Executive Secretary of CPLP created in 2007 the Information Center on Social Protection (CIPS).¹⁹ The objectives of the CIPS are:

- To provide information in Portuguese to managers with responsibilities related to the social protection, improving knowledge and information in this area.
- To guide policy decisions, supporting decision makers through research and experience and provide a framework of different approaches and strategies used in the Portuguese-speaking world.
- To create opportunities for institutions and civil society, enhancing the exchange of information and knowledge about the extent of social protection for the benefit of the people.

In 2010, in Fortaleza, the Ministers of Labor and Social Affairs of the CPLP recognized the importance of the CIPS and adopted the resolution to ensure the continued development of the center.

In the legal context, is worthy of reference another case, the Legis-PALOP,²⁰ inserted under the Project Support Development to Judicial Systems of the PALOP (Angola, Cape Verde, Guinea Bissau, Mozambique S. Tomé and Príncipe), inserted in the PALOP Regional Indicative Programme II, financed by the 9th European Development Fund (EDF) and the Portuguese Institute for Development Support (IPAD).

The project, initiated in 2008, is an ambitious project of providing a platform of knowledge and of legal information among the African Countries of Portuguese Official Language (PALOP) and for those who wants to know these subjects, providing access to legislation, jurisprudence (higher courts) doctrine and documents, published after the independence and a common thesaurus. Besides, in partnership with

¹⁹ Centro de Informação em Proteção Social (CIPS), http://www.cipsocial.org/index.php?option=com_content&task=view&id=57&Itemid=105.

²⁰ Legis-PALOP, <http://www.legis-palop.org/bd>.

the Overseas Historical Archive of Institute of Tropical Research (IICT), were collected all legislation published since 1926 to the African independences.

The Legis-PALOP became a recognized instrument of Lusophone citizenship and civic and economic development, actively contributing to the consolidation a fairer society and a more solid international position of the PALOP.

In this context, the presentation ends up with another recent initiative, consequence of a doctoral thesis,²¹ defended in 2007. The research emphasizes the privileged place of the national library, as an encyclopedic institution, for the conservation of the heritage literature produced in a country, the responsibility to elaborate the national bibliography and the obligation to provide the national heritage to the largest possible number of users.²²

The economic growth provided the increased of literacy of the population and the demand of the information. National libraries were obliged to enrich their collections, introduce new areas of knowledge, practice new functions and question their new mission and priorities in a context of the new digital world.²³ Besides, the National Library is one of the key elements of the national information policy, as well as the national archives and the archaeological museum, serving the preservation and dissemination of cultural heritage of each country.²⁴

In this perspective, the study of the Lusophone National Libraries allowed to design a theoretical, conceptual and methodological proposal, called *Methodological Guide for the Implementation of Lusophone Digital Library*, which the potential users exceed 240 million Lusophone people.

The mission of this initiative is the establishment of a cooperation project, oriented to the collection, access, preservation and distribution of a network of digital objects belonging to cultural and documental heritage of the Lusophone National Libraries, as well as the creation of their infrastructure and services.

The proposal includes the creation of a free access portal to digital content, contributing for the integration of the Lusophone countries in the knowledge society, the safeguarding of the documental heritage, the democratization of the access to it and promotes the Portuguese language in the cyberspace.

The International Association of the Lusophone Digital Library, in Portugal, the Lusophone National Libraries and the Information Science Department of the Carlos III University of Madrid, in Spain, recently developed a project for the safeguarding of the Portuguese Language documentary heritage, named the Lusophone Digital Library, which is waiting for financial support of the UNESCO.

Le réseau francophone numérique¹

Benoit Ferland et Tristan Müller

Bibliothèque et Archives nationales du Québec (BAnQ)

Résumé

Le Réseau francophone numérique (RFN) offre un accès centralisé au patrimoine documentaire francophone numérisé. Le Réseau rassemble aujourd'hui 24 institutions. Le portail du RFN diffuse gratuitement des centaines de milliers de documents en langue française. Plusieurs activités de formation et de transfert de savoir-faire ont été réalisées auprès d'un nombre croissant d'institutions documentaires de la Francophonie. Pour les institutions patrimoniales francophones membres, le réseau constitue également un forum d'échanges autour des enjeux de conservation du patrimoine documentaire à l'ère numérique.

Auteurs

Benoit Ferland est le directeur général de la conservation à Bibliothèque et archives nationales du Québec. Il est détenteur d'une maîtrise de l'École de bibliothéconomie et des sciences de l'information de l'Université de Montréal (EBSI), d'une maîtrise en administration publique (ENAP), d'un certificat en archivistique (UQAM) et d'un diplôme de premier cycle en histoire (Université de Montréal). En plus d'être chargé de cours à l'EBSI, M. Ferland agit régulièrement en tant que consultant et formateur. Il œuvre depuis près de 30 ans dans le milieu des bibliothèques. Il est l'auteur d'un ouvrage de bibliothéconomie : *L'élaboration des politiques en milieux documentaires*.

Tristan Müller a obtenu un diplôme de maîtrise en bibliothéconomie et en sciences de l'information de l'Université de Montréal en 1999. Il a travaillé au Jardin botanique de Montréal, puis pour un projet de la Banque Mondiale au Burkina Faso. Depuis 2004, il travaille à Bibliothèque et Archives nationales du Québec (BAnQ); d'abord comme bibliothécaire, puis comme chef du service du prêt. Il est directeur de la numérisation depuis 2012.

1. Introduction

Depuis le début des années 2000, plusieurs projets internationaux de bibliothèques numériques ont vu le jour : Bibliothèque numérique mondiale (World Digital Library), Europeana, Google Books, etc. Une rapide analyse du contenu de ces bibliothèques montre que la très grande majorité des documents diffusés sont en langue anglaise. La raison en est fort simple : les principaux fournisseurs de documents numériques proviennent de pays anglo-saxons. Pourtant, le patrimoine documentaire mondial n'est pas limité à l'anglais. Le français, par exemple, est une langue parlée par plus de 220 millions de personnes à travers le monde² et l'une des deux seules langues parlées (avec l'anglais) sur les cinq continents. Chaque année, plus de 70 000 livres³ sont publiés dans cette langue. Or, à l'aube du 21^e siècle, le constat est frappant : le patrimoine documentaire de la Francophonie est pratiquement absent de ce nouveau paysage

numérique. L'omniprésence de la langue anglaise sur le Web fait craindre, à plusieurs, que la présente situation conduise à une lente, mais inéluctable uniformisation culturelle.

2. Historique

À la lumière de ce constat inquiétant, l'Organisation internationale de la Francophonie insiste dès 2004 pour que le développement durable développement soit « attentif à la diversité culturelle et linguistique. »⁴ Dans cette mouvance, la Bibliothèque nationale de France a lancé, en 2006, un appel aux bibliothèques nationales francophones pour une diffusion concertée du patrimoine documentaire francophone sur le Web. Six bibliothèques nationales de la Francophonie (Belgique, Canada, France, Luxembourg, Québec, Suisse) ont répondu à l'appel. Toutes ont reconnu le rôle crucial des programmes de numérisation pour le rayonnement des cultures francophones et de la langue française. Pour relever ce défi, ce groupe se constitue alors en un Réseau francophone des bibliothèques nationales numériques (RFBNN). Peu de temps après l'Égypte, qui est membre de la francophonie, s'est joint au groupe.

Compte tenu de son importance aux yeux des dirigeants francophones, le nouveau réseau reçoit d'emblée l'appui⁵ de l'Organisation internationale de la Francophonie (OIF⁶). Cette organisation est composée de 75 États et gouvernements (56 membres et 19 observateurs) — soient plus du tiers des États membres des Nations unies. En 2007, dans un discours aux bibliothèques nationales et patrimoniales des pays ayant le français en partage, Abdou Diouf, Secrétaire général de la Francophonie, cerne assez bien l'enjeu stratégique de la présence du fait français sur Internet :

Ce qui se joue, en ce moment même, c'est la présence de la langue française, l'existence des cultures en langue française dans l'espace numérique. Demain, ce qui ne sera pas numérisé et rendu accessible en ligne, risque d'être tout simplement occulté, pour ne pas dire oublié. Or, notre communauté a de grandes richesses à partager et à faire partager.⁷

Afin d'offrir un accès centralisé au patrimoine documentaire francophone numérisé, les membres du Réseau francophone des bibliothèques nationales numériques décident de mettre en place un portail Web. La conception et la réalisation technique de ce portail ont été confiées à Bibliothèque et Archives nationales du Québec (BAnQ). En 2008, le portail Web du RFBNN est officiellement lancé à l'occasion du XIIe Sommet des chefs d'État et de gouvernement de la Francophonie à Québec.

En 2010, le Réseau s'ouvre à toutes les institutions chargées de préserver et de diffuser le patrimoine francophone. C'est ainsi que le RFBNN change de dénomination et devient le RFN : le Réseau francophone numérique. En 2012, en à peine six ans d'existence, le RFN est passé de 6 à 24 institutions. On peut parler d'une croissance importante et soutenue.

Il faut par ailleurs souligner que l'Organisation internationale de la Francophonie participe activement au RFN, notamment en jouant un rôle d'observateur lors des diverses rencontres des membres du RFN, mais également en offrant d'autres formes d'appuis (financier, logistique, etc.).

3. Gouvernance

Chaque année, une assemblée générale de tous les membres du RFN est organisée. L'assemblée adopte les clauses de la charte du Réseau, propose un président d'assemblée, nomme un comité de pilotage, approuve l'adhésion de nouveaux membres et se prononce sur les développements et les orientations du Réseau.

Le comité de pilotage, composé de 7 membres et d'observateurs de l'OIF, se réunit deux fois par année et joue le rôle de comité exécutif. Il définit, entre autres, les grandes orientations et les axes de développement du portail du RFN et assure l'engagement et la participation continue et soutenue des institutions membres.

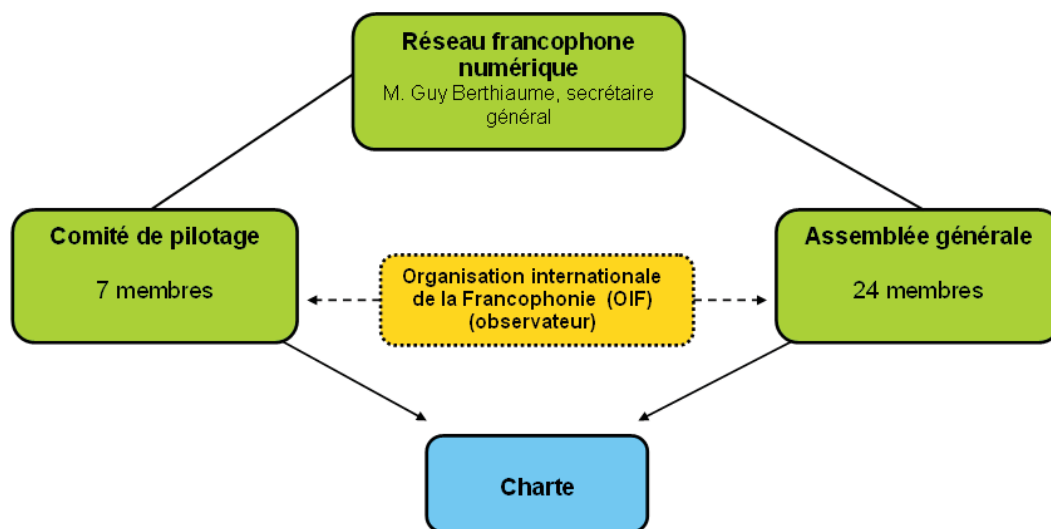

Figure 2. Structure de gouvernance du RFN.

4. Mission

Le RFN s'est donné une triple mission:

1. Grâce à la numérisation, **préserver un patrimoine précieux** souvent menacé de disparition et le diffuser gratuitement auprès d'un large public.
2. Assurer le **transfert de savoir-faire** auprès d'un nombre croissant d'institutions documentaires de la Francophonie.
3. Offrir aux institutions patrimoniales de l'espace francophone un **forum d'échanges** autour des enjeux de l'ère numérique.

Par ce très louable énoncé mission, le RFN s'engage en faveur de la diversité culturelle, du rayonnement de la culture francophone et de la solidarité internationale. Pour les pays du Sud, il s'agit d'une incitation à préserver leurs documents rares et précieux grâce à la numérisation. Enfin, le RFN est considéré comme un moyen unique de mise en valeur et de diffusion du patrimoine documentaire francophone dans le monde entier.

5. Activités

5.1. Portail RFN

On peut affirmer que la préservation des documents patrimoniaux profite grandement des avancées technologiques des outils de numérisation. Les documents patrimoniaux numérisés permettent de protéger numériquement et souvent à distance les documents originaux. La diffusion de ce patrimoine numérisé passe principalement par le web.⁸ Il s'agit d'une vitrine exceptionnelle vers les collections francophones numérisées. L'accès à la richesse des diverses collections nationales, déjà diffusées sur les sites Internet des institutions membres du Réseau, se trouve multiplié par le regroupement sur un même portail. Il faut en effet considérer que les divers pays membres, même s'ils partagent un attachement à la langue française, présentent des éléments culturels propres qui sont autant de facettes culturelles spécifiques qui enrichissent la diversité culturelle de la Francophonie.

Le portail du RFN donne accès à des collections de journaux, revues, livres, cartes et plans, archives et enregistrements vidéos numérisés par 15 pays. Les principes qui prévalent au développement du portail du RFN sont:

- Utiliser les collections numérisées existantes et établir des liens avec les sites web des institutions membres;
- Alimenter progressivement le portail de nouvelles collections de documents;
- Assurer un accès gratuit aux documents.

En 2012, le portail donne accès à :

Tableau 2. Documents accessibles par le portail du RFN en 2012

Journaux	Plus de 640 000 fascicules 75 titres Essentiellement du 19e et 20e siècle
Revue	Près de 3 700 fascicules 39 titres Principalement du 20e siècle
Livres	Environ 40 titres
Cartes et plans	Collection thématique America, 1500-1800 (BAnQ) Le Canada à l'échelle : les cartes de notre histoire (BAC)
Archives	7 ensembles d'archives Ex. : Mémoires du Canal de Suez (Bibliotheca Alexandrina)
Documents audiovisuels	Le Cercle littéraire et conférences en ligne de la BnF Arthur Lamothe et les Innus : culture amérindienne (BAnQ) Au fil des mots : treize poètes québécois se racontent (BAnQ)

Il est pertinent de préciser que le portail du RFN ne contient pas de documents numériques, mais plutôt des listes ou index de métadonnées des collections numériques.

⁸ <http://www.rfnum.org>.

Concrètement, l'ajout d'un nouveau document au portail consiste à extraire les métadonnées disponibles sur le site Web de l'institution et de les transformer conformément au Dublin Core qualifié. Cette opération se fait actuellement par la récupération directe via FTP de fichiers de métadonnées (ex.: XML) ou par la génération manuelle de fichiers de métadonnées. Celles-ci sont ensuite transformées en fichier XML puis chargées dans Solr.⁹ Le portail constitue en définitive une sorte d'entrepôt de métadonnées des collections numérisées des institutions membres du RFN. Ce procédé permet de pointer directement sur les documents numérisés, donnant ainsi un autre point d'accès aux internautes du monde entier intéressés par des documents de langue française. À son tour, le portail du RFN peut être moissonné par d'autres bibliothèques numériques puisqu'il utilise le protocole OAI-PMH.¹⁰

Le moteur de recherche Solr, intégré dans le logiciel de gestion de contenu web dotCMS,¹¹ permet de faire une recherche dans les métadonnées. L'interface actuelle offre des possibilités de recherches par type de document, pays, titres et dates. La conception, l'hébergement et la gestion du portail RFN sont effectués par BAnQ, en concertation avec la BnF, la Bibliotheca Alexandrina et l'OIF.

Enfin, le portail comprend aussi un espace professionnel dédié à la numérisation. Dans cette section, on retrouve des documents de formation réalisés pour les stages et d'autres documents complémentaires sur les méthodes et normes de numérisation.

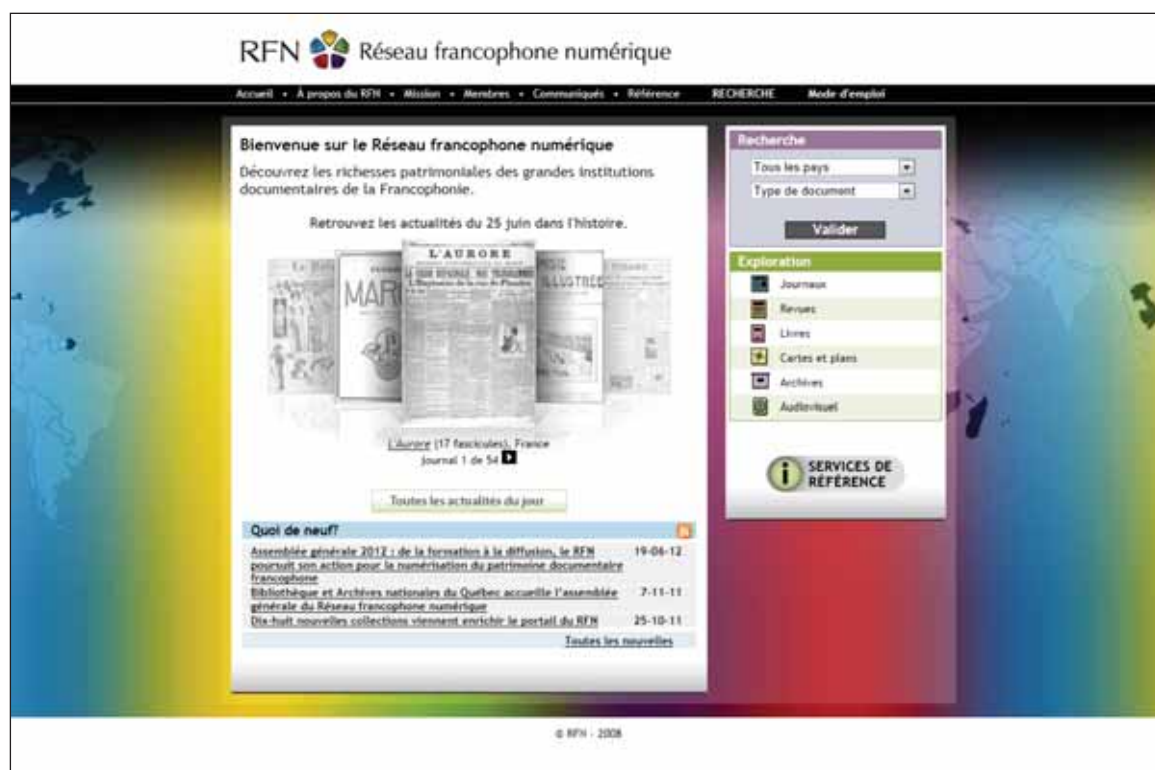

Figure 3. Interface du portail RFN.

⁹ <http://lucene.apache.org/solr/features.html>.

¹⁰ <http://www.openarchives.org/pmh/>.

¹¹ <http://dotcms.com/>.

La mise en œuvre du portail comporte plusieurs défis. Il faut comprendre que la qualité des documents fournis par les institutions est inégale. Les institutions ne bénéficiant pas toutes des appareils derniers cris. Il appert en outre que les métadonnées peuvent être parfois incomplètes ou carrément inexistantes. On peut aisément comprendre qu'il s'agisse d'une problématique importante, considérant que le portail utilise les métadonnées comme index référant vers les documents. Une autre difficulté rencontrée est celle de la diversité des standards et des protocoles. Finalement, il faut mentionner que l'accès aux contenus est tributaire de la disponibilité des systèmes documentaires locaux. Toutefois, des solutions existent déjà pour répondre à ces défis. Il reste évidemment à toutes les mettre en œuvre. C'est sans doute par le partage des forces et des expertises des membres du Réseau que ces défis sauront être relevés.

5.2. Stages et mission de formation

Le partage du savoir-faire est une partie essentielle de la mission du RFN. Ce partage des connaissances et des ressources, notamment en ce qui a trait à la numérisation, passe par la coopération entre les pays du Nord et du Sud. Depuis 2008, ce partage a pris la forme de stages de formation tenus notamment en France (avril 2008), en Haïti (juin 2009), au Sénégal (janvier 2011) et au Maroc (mai 2012). Il faut souligner que la participation à ces stages n'étaient pas uniquement réservés au personnel des institutions hôtes, mais aussi aux autres institutions. Par exemple, lors du stage au Maroc, plus de 19 personnes ont été formées. Ceux-ci provenaient du Maroc, de Tunisie, du Sénégal, du Mali, du Burkina Faso, du Togo, du Bénin et de Côte d'Ivoire. Le programme de formation comportait les éléments suivants:

1. Principes de constitution d'une collection numérique et modalités de développement d'un projet.
2. Éléments techniques de la numérisation des documents imprimés, iconographiques et audiovisuels : normes, matériel, logiciels, traitement des fichiers numériques, reconnaissance optique de caractères, etc.
3. Archivage et diffusion des documents numériques : supports et métadonnées.
4. Chaîne et techniques de numérisation : tri et sélection des fonds à numériser, gestion des droits d'auteur, préparation et numérisation des documents (papier et audiovisuels), reconnaissance optique de caractères, contrôle de la qualité des documents numérisés, sauvegardes des documents numérisés sur les serveurs et/ou DVD, création des métadonnées, mise en consultation des documents numérisés.

À l'occasion de ces stages, l'institution hôte se voit offrir des équipements de numérisation (ordinateurs, numériseurs, logiciels et imprimantes) complémentaire à ceux déjà en place. Cette façon de faire permet aux institutions bénéficiaires de disposer d'une plateforme de numérisation très fonctionnelle. Par exemple, lors du stage au Sénégal, un appareil photo Canon D9 ainsi que deux numériseurs à plat ont été acquis. Ceux-ci ont été utilisés pour numériser des documents souvent difficiles à manipuler, notamment les manuscrits du premier président du Sénégal indépendant Léopold Sédar Senghor. Tous ces stages ont été donnés soit par la Bibliothèque nationale de France, Bibliothèque et Archives nationales du Québec ou conjointement et toujours avec la complicité de l'institution hôte. Réunissant des institutions de différents pays, ces stages constituent l'occasion par excellence de discuter sur les pratiques de numérisation. Il s'agit non seulement d'une opportunité de formation, mais aussi d'échanger librement sur divers aspects de la numérisation du patrimoine documentaire de diverses nations dans une langue commune de partage.

En 2009, une mission de numérisation auprès de 3 institutions patrimoniales khmères (Bibliothèque nationale, Musée national, Centre d'études khmères) a eu lieu dans la tradition de partage du savoir-faire du Réseau. La mission khmère consistait à sélectionner les fonds de périodiques en langue française pertinents à numériser pour le RFN, à examiner les conditions de leur numérisation et à former le personnel permettant la mise en place d'une chaîne efficace de numérisation. La mission a été réalisée par la Bibliothèque nationale de France.

L'impact de ces stages et mission a été immédiat et concret. On a pu constater une amélioration certaine des processus de numérisation en place, et ce, tant en efficacité qu'en qualité. Le transfert de connaissances techniques dans le domaine de la numérisation s'est opéré à un niveau très encourageant. Par la suite, la méthode de formation des formateurs permet aux gens formés lors des stages, d'eux-mêmes formés par la suite leurs compatriotes.

Dans la mise en œuvre du transfert de savoir-faire, plusieurs défis ont été rencontrés : les logiciels et le matériel utilisés pour le calibrage du matériel de numérisation (écrans et numériseurs) ont un coût très élevé pour les institutions du Sud; plusieurs institutions n'ont pas les compétences informatiques ni l'infrastructure technologique pour diffuser leurs documents numérisés dans des bibliothèques numériques (Greenstone,¹² DSpace,¹³ etc.); et certaines institutions qui ont bénéficié d'une formation ne disposent pas toutes des équipements de numérisation pour mettre en pratique les compétences acquises.

Figure 4. Session de formation au Maroc.

6. LE RFN DE DEMAIN

Le Réseau francophone numérique compte actuellement 24 membres et représente 21 pays. Or, l'Organisation internationale de la Francophonie comprend 75 États et gouvernements et le nombre de membres potentiel dépasse la centaine. L'orientation du RFN sera donc de continuer son expansion dans d'autres régions de l'espace francophone, notamment l'Europe de l'Est (ex. : Roumanie) et l'Amérique du Sud (ex. : Guinée française).

La croissance du réseau permettra de multiplier les échanges et les possibilités de parrainage. Le portail du réseau bénéficiera aussi de l'arrivée de nouveaux membres qui ajouteront leurs collections patrimoniales à celles déjà présentes.

¹² <http://www.greenstone.org/>.

¹³ <http://www.dspace.org/>.

L'interface et les fonctionnalités du portail du RFN seront revues en profondeur. Une nouvelle interface plus épurée mettra davantage en valeur les collections des institutions membres. Cette valorisation des collections numériques passera notamment par exergue une mise en valeur des trésors nationaux. Un document reconnu comme un « trésor national » devra présenter une importance historique ou culturelle significative ou encore posséder un caractère unique ou original. En plus de cette mise en valeur, les membres du RFN s'entendent pour enrichir le portail de collections audiovisuelles et de documents patrimoniaux issus de la tradition orale. On prévoit aussi l'ajout de nouvelles fonctionnalités : le développement d'une option de récupération des métadonnées par moissonnage, si l'institution membre possède ce service (ex. : OAI-PMH); des fonctions de recherche simple et avancée; la possibilité de rechercher en texte intégral dans les collections du RFN; un affinement des résultats de recherche par

Figure 5. Nouvelle interface du portail RFN.

facettes; des notices plus détaillées; et l'ouverture des métadonnées en mode *Open Access* afin qu'elles puissent être réutilisées à différentes fins.

Afin de combler certaines lacunes informatiques et technologiques de certains membres du RFN, la BnF proposera un nouveau service appelé « Gallica Marque Blanche ». Ce service offrira des possibilités de stockage, de diffusion et d'archivages des documents numérisés sur les serveurs de la BnF. Ce service est personnalisable, c'est-à-dire que chaque bibliothèque numérique aura sa propre identité visuelle adaptée aux couleurs de son institution. Le portail du RFN n'aura qu'à moissonner directement les métadonnées de ces serveurs pour effectuer une nouvelle valorisation de ces collections.

En ce qui concerne le partage du savoir-faire, de nouvelles avenues de transmission sont envisagées. On peut penser notamment à la création de stages régionaux de formation spécialisés en lien avec un projet particulier de numérisation. Un accompagnement sera également assuré pour la mise en œuvre de projets de numérisation, de la sélection du projet jusqu'à la mise en ligne des contenus et leur intégration dans le portail du RFN. Cette méthode permettra d'agir beaucoup plus directement avec le personnel des institutions membres. Ce soutien sera essentiellement assuré à distance après une intervention ciblée auprès d'une institution.

7. Conclusion

Après seulement quelques années d'existence, le Réseau francophone numérique est devenu un formidable moyen de sensibiliser les responsables culturels des États de la Francophonie à l'importance et parfois même l'urgence de sauvegarder leur patrimoine documentaire et de le rendre accessible à tous grâce à la numérisation. L'adhésion à ce Réseau, qui ne cesse de grandir, constitue la preuve concrète qu'une coopération efficace est possible entre institutions, bibliothèques et centres d'archives dont la langue de partage est le français. La diversité culturelle de l'espace numérique se trouve certainement renforcée par la présence du RFN sur le Web. Toutefois, il faut se rappeler que ce type de projet est tributaire de l'engagement actif de toutes les grandes institutions documentaires de la Francophonie et même au-delà. Par exemple, une coopération avec l'UNESCO pour l'accès aux contenus du RFN à partir de la Bibliothèque numérique mondiale (<http://www.wdl.org>) serait probablement bénéfique pour une meilleure diffusion de ce patrimoine mondial.

The World Digital Library

John Van Oudenaren¹

Director, World Digital Library, The Library of Congress, USA, www.wdl.org

Abstract

The World Digital Library is an international collaborative project that fosters access to documentary heritage through digitization, capacity building and technical assistance, and the maintenance and continuous development of www.wdl.org, a website that provides free, multilingual access to cultural heritage. Topics covered in this paper/presentation include: (1) project objectives; (2) content selection and potential legal, ethical, and political issues associated with selection; (3) capacity building challenges in developing countries; (4) partnership with the UNESCO Memory of the World program; (5) understanding and targeting audiences and user groups; (6) the challenges of multilingualism; and (7) the WDL and preservation (physical and digital). Particular attention is devoted to cultural and professional challenges, such as those identified in the conference scope paper, and how the WDL is coping with these challenges, and to the need for coordination among global, regional, national, and institutional projects to meet user demands and to meet the broader global challenge of preserving the “memory of the world in the digital age.”

Author

John Van Oudenaren directs the World Digital Library (www.wdl.org), a collaborative initiative of the Library of Congress, UNESCO, and libraries and other cultural institutions from around the world. Previously he was chief of the European Division at the Library of Congress and director of the Library's *Global Gateway* international digital library collaborations. Prior to joining the Library in 1996, he was a senior researcher at RAND in Santa Monica, California. He received his Ph.D. in Political Science from the Massachusetts Institute of Technology and his A.B. in Germanic Languages and Literature from Princeton University.

1. Introduction

It is now more than seven years since Librarian of Congress James H. Billington first proposed the establishment, in a June 2005 speech at Georgetown University to the U.S. National Commission for UNESCO, of a World Digital Library. At the time, the United States was in the process of rejoining UNESCO after a nearly twenty-year absence. The U.S. national commission was soliciting projects that the United States might bring to the organization. Billington called for a cooperative project, to be undertaken by the Library of Congress and partner libraries from around the world in cooperation with UNESCO, to digitize and make freely available over the Internet primary source documents that tell the stories and highlight the achievements of all countries. Such a project, he argued, “would hold out the promise of bringing people closer together precisely by celebrating the depth and uniqueness of different cultures in a single global undertaking.”²

¹ The opinions expressed in this paper are personal and do not express the views of the Library of Congress or the United States government.

² James H. Billington, The Librarian of Congress, Remarks to the Plenary Session, The U.S. National Commission for UNESCO, Georgetown University, June 6, 2005. Text at: <http://www.loc.gov/about/librarianoffice/speeches/060605.html>

In December 2005, the Library of Congress announced that it had received initial financial support from Google, Inc. to begin planning the WDL. The announcement of funding led to a flurry of interest in the WDL. UNESCO welcomed the initiative, but understandably had questions about how it fit with the organization's program and priorities. The Governing Board of the International Federation of Library Associations and Organizations (IFLA) was briefed on the initiative and expressed interest. A number of heads of national libraries offered to participate. But there was also skepticism. European libraries were embarking on their project to create a European digital library, and some wondered how a WDL would mesh with this effort. In developing countries—and not just developing countries—there were the usual suspicions about American cultural imperialism. Many librarians and academics in the United States and Europe saw the WDL's initial association with Google, even if limited to a no-strings-attached financial contribution, as problematic. At the very least, some in the library community saw in the declared intention to create a *world* digital library a certain over-ambitiousness, a grandiosity that they found off putting.

Within the Library of Congress, a team was established to begin the internal deliberations and external consultations aimed at translating Billington's vision into reality. Exactly what that reality would be was as yet wide open. General objectives had been set, but decisions needed to be made about technical architecture, content selection, target audience, modes of participation, and much else.

This paper will review the main decisions that the Library of Congress team and its leading external collaborators made in planning the WDL and the implications those decisions had for the subsequent development of the project. Its purpose is not to recount history for its own sake, but to draw lessons with the goal of applying these lessons to the overall session topic: "Beyond Access: Digitization to Preserve Culture."

2. Decisions and Choices

The WDL planning team was aware of the skepticism in some quarters about the idea of a world digital library. Indeed, some at the Library of Congress who had participated in various national and international digital library projects had reasons of their own to wonder whether such an ambitious undertaking could succeed. So they proceeded cautiously and incrementally. They decided that the first question to be answered was not, "how do we create a world digital library?" but rather "What should a world digital library look like in order to be worthy of the name?" What capabilities, features, and content should be offered to create a digital library that people will actually find useful? What added value must it offer to attract users who already have access to Google? And how should it differ from or complement the array of national and international digital library projects to which people already have access?

It was also important to plan the WDL with reference to evolving user expectations and emerging technologies. By 2006, when work on the project got underway, the World Wide Web was thirteen years old. At the Library of Congress, projects such as *American Memory* had been underway for a decade. A series of bilateral international digital library collaborations, beginning with the *Meeting of Frontiers* project with Russia, went back to 1999.³ A growing body of evidence, both anecdotal and statistical, existed about what Internet users liked about the digital library projects that cultural institutions such as the Library of Congress were undertaking—but also about what they disliked and found frustrating.

³ This project remains online, and can be seen at <http://frontiers.loc.gov>.

The applications and devices by which people accessed online content also were changing. The introduction of smart phones and the explosion in use of eReaders were just over the horizon (Steve Jobs introduced the iPhone in January 2007, Amazon the Kindle in November of that year), but Google had already revolutionized the world of search. *American Memory* had been designed to enable a student looking, for example, for photographs of the American Civil War to go to the Library of Congress website, to proceed from there to *American Memory*, to look within *American Memory* for the photograph collections, to choose from among the photograph collections that of Mathew Brady, and then to search or scroll through a browse list to find the desired picture. This hierarchical approach, which had grown out of the early attempt to mirror in cyberspace the internal structures of the Library and its custodial units and collections, was now obsolete. Users wanted to type “Civil War soldier pictures” into a search box and be taken directly to the photos they were seeking. This and other changes in user behavior needed to be factored into the planning.

And, as if Google had not already caused enough havoc in the library world, what was at the time called “Google Print” was announced in November 2004 at the Frankfurt Book Fair. A month later, the first set of agreements between Google and leading research libraries—Harvard, the University of Michigan, the New York Public Library, Oxford, and Stanford—for what would become Google Books was announced. This soon led to talk about “every book in the world” being digitized, which at least for some observers created further confusion with a projected “world digital library.”

Against this background, the planners came to focus on three main sets of requirements for the proposed WDL: (1) multilingualism; (2) universality; and (3) a high level of functionality and added value aimed at actual users.

Multilingualism. A true WDL had to be multilingual, with regard both to content and to access. The Library of Congress alone collects in more than 400 languages, and there was no reason why each of these 400 languages (and possibly many others), including endangered languages of particular interest to UNESCO, should not be represented on the WDL.

Access also had to be multilingual. This was a much greater challenge, but one that would be impossible to avoid. The question was how multilingual access would be provided and in what languages. It was decided to offer the WDL interface in the six official languages of the United Nations: Arabic, Chinese, English, French, Russian, and Spanish. A seventh language, Portuguese, was added, as the National Library of Brazil became a co-founder of the project and a major early contributor of content. For each of these languages, the goal was to provide a uniform user experience, with all navigational information and metadata in all seven of these languages.

It was further decided to offer translation by professional translators and subject matter experts. Machine-assisted translation tools would be used to boost productivity and lower costs, but qualified humans would remain in the loop. Notwithstanding the incredible progress made in recent years in machine translation, the assumption was that only translation by qualified professionals would do justice to the type of content being presented: rare and historic documents, which by their very nature are deeply embedded in national cultural and linguistic contexts. Various other choices in theory might have been made (e.g., use of volunteers on the “wiki” model or resort to “on the fly” machine translation) that might have allowed for a larger number of languages (or freed up resources spent on translation for other tasks, e.g., faster growth in adding content to the WDL), but these approaches were rejected, at least for the moment, as inappropriate for what the WDL was attempting to achieve.

Universality. By definition, the WDL had to be universal, both with regard to participation and content. The WDL had to be open to libraries, archives, and museums from every country in the world: to

any institution that held and was ready to provide important content with bearing on the collective history of humanity. It also had to include material from and *about* all countries and cultures, on the assumption that all had contributed to the heritage of humanity and all had material worthy of inclusion—over a range of time periods and in different formats.

The requirement for universal participation immediately raised the question of capacity. It was obvious that cultural institutions in many countries, particularly but by no means exclusively in the developing world, had little or no capacity to digitize their collections for inclusion in the WDL or in any other project. To aspire to the goal of universal participation, the WDL thus had to include from the beginning a commitment to capacity building and technical assistance—to working with libraries and other partner institutions on acquiring the equipment and skills that would enable these institutions to participate.

The Library of Congress already had experience in the early 2000s in providing equipment, software, and training to libraries in Russia (Moscow, St. Petersburg, and Novosibirsk) and Brazil (Rio de Janeiro) in support of bilateral cooperative digital projects with these countries. Creation of a world digital library with universal or near-universal participation would require replication of these efforts on a vastly wider scale. The Library of Congress lacked the mandate and the resources (financial and human) to take on such a task, but it was hoped that assistance would be provided by the wider international community.

Functionality and user added value. This third set of projected requirements encompassed numerous dimensions and involved a great deal of discussion in the planning, prototyping, and development stages of the project, both within the Library and with prospective WDL partners.

Content selection was arguably the first and most important area in which the WDL needed to add value. Selection in turn was linked to preferences and assumptions about the desired end-state size of the WDL. At one extreme, a WDL could be designed as very small and selective: for example, a “top ten treasure” list of items from each of the 193 UN member countries, or fewer than 2,000 items in all. At the other extreme were examples of vast projects such as Europeana and Google BookSearch, which aimed to gather on a single portal tens of millions of metadata records and/or digitized works.

In the end, it was decided to adopt a middle course: to build a representative body of content relating to the history and culture of all countries, with culture defined in the broad anthropological sense, with a heavy focus on special collections and rare and unique documents. Selection criteria were elaborated by a content selection working group (subsequently transformed into the Standing Committee on Content Selection), which met in Paris in October 2007 and again in Cairo in January 2009, and which endorsed the idea of showing content important “for the history of humanity.”⁴ Particular emphasis was placed on including collections already listed on the UNESCO Memory of the World registry, a pre-existing list drawn up by an established nomination and vetting process, and which the WDL had no need to reinvent.

The second area in which the WDL needed to add value was in the discovery and display of content. This related fundamentally to metadata and, by extension, to the search and browse capabilities that particular sets of metadata would enable. The WDL’s declared emphasis on promoting intercultural understanding implied that it should enable users to access sets of content by which they could, for example, compare the achievements of different civilizations in the same historical time period (e.g., 16th century maps or printing in China, Europe, and the Islamic world), track developments over time in the same country (e.g., Egypt in the Pharaonic, Hellenistic, and Islamic periods), and search and browse objects or topics relevant at different times in different periods (e.g., pyramidal structures built in ancient Egypt, ancient Mesopotamia, and pre-Columbian America).

⁴ <http://project.wdl.org/content/contentguidelines.html>.

This requirement implied a heavy reliance on traditional metadata, much of which would need to be enhanced by adding new fields and values to the bibliographic records provided by contributing libraries. To the extent possible, metadata had to be provided at the item level, with the item defined, as often as feasible, as a single photograph within an album or a single map within an atlas. Only in this way could the individual photograph or print in one album be located and paired with an analogous photograph or print from a different album (or with a book, manuscript, map, and so forth). This approach was certain to be expensive and time-consuming, and it to some extent cut against the broader trend in the library community, in which users and providers of content alike were looking either to open-ended search or to user tagging to replace (or at least supplement) traditional metadata.

Going beyond improved discovery and display of content, it was also decided that the WDL would *explain* and *interpret* content. This was to be done primarily through descriptions, which were made an integral part of the WDL metadata scheme and provided for all items, as well as through curator videos for selected items. Users of many first generation digital library projects had been complaining about what they perceived as libraries' practice of throwing vast amounts of content up on the Internet and leaving it to the users to figure out what it was. So the decision was made to enhance every item-level display record with a paragraph-length description. Detailed instructions on how to write and edit descriptions have since been developed, but in essence the descriptions were and are intended to answer a simple, two-part question: "what is this thing and why does it matter?" The answer to this question was to be given in straightforward, non-technical, jargon-free language, accessible to the interested general public and readily translatable into the seven WDL languages. Many bibliographic records already contained note fields with detailed information about particular rare books, manuscripts, maps and so forth, or such information could be gathered from exhibit catalogs and labels, scholarly journals, and finding aids. However, in many cases this information did not exist and would need to be researched and written from scratch.

These early choices regarding how content would be cataloged and displayed, along with the requirements of multilingualism, largely determined the choice of technical architecture. A distributed system that simply aggregated metadata or provided a federated search was rejected in favor of centrally gathering the content, which then would be distributed worldwide through a content delivery system to maximize speed and performance. All metadata and images would be ingested from partners, and the WDL would use a standard metadata scheme for all items, with values provided for all essential fields and translated into the seven interface languages. This approach was intended to ensure a uniform user experience for all content, regardless of the institution providing the content and the manner in which that content was displayed on the institution's own website (which the WDL always linked back to at the item level in any case). This choice of architecture in turn made possible certain other features, for example text-to-speech conversion for metadata and descriptions and standardized content download options.

In setting these requirements, the planning team did not completely disregard questions of cost, but it treated these questions as something to be considered in a second stage of the analysis. As indicated, the first set of questions revolved around what a WDL should look like and what would make the project really "worth doing." They did not focus on what it might cost to build and sustain the WDL and on what combination of government, private, and foundation sources might be prepared to meet this cost. But considerations of cost were not entirely overlooked. Some rough initial estimates regarding costs were put forward. In the discussion paper prepared for the December 2006 UNESCO Experts Meeting, for example, the figure of \$27,000,000 over a five-year period was floated as a credible estimate.

3. Implementation and Results

Having settled on and defined these three main sets of requirements, the Library of Congress and its international collaborators began to implement the project. There is no need to recount in detail this process, but a few milestones are worth mentioning.

In December 2006, the Library and UNESCO jointly convened an experts meeting at UNESCO headquarters in Paris to solicit input about the proposed project from librarians and technology experts from around the world. The results of the Paris meeting included the establishment of working groups for technical architecture and content selection and a decision that the Library of Congress would develop the prototype of a future world digital library for presentation at the October 2007 UNESCO General Conference. The prototype was presented as planned, with content provided by six partner institutions: the National Library of Brazil, the Bibliotheca Alexandrina of Alexandria, Egypt, the National Library and Archives of Egypt, the National Library of Russia, the Russian State Library, and the Library of Congress.

There were also breakthroughs in technical assistance and capacity building. As a pilot project to gain experience and help in better understanding the challenges and costs of providing such assistance, in 2006 the Library of Congress concluded an agreement with the National Library and Archives of Egypt to provide high-end equipment to NLAE for the purpose of digitizing Arabic scientific manuscripts for inclusion in the WDL. Similar agreements were concluded with and similar sets of equipment provided to the Iraqi National Library and Archives and to the National Library of Uganda (the latter with funding from Carnegie Corporation of New York).

Following eighteen months of intensive planning and development, www.wdl.org was officially launched at UNESCO headquarters in Paris on April 21, 2009. Developed at the Library on the basis of the 2007 prototype, the site featured content contributed by institutions from eighteen countries, including the national libraries of China, France, Israel, Japan, Russia, Serbia, and Sweden as well as major university libraries from several nations.⁵ The national libraries of Egypt, Iraq, and Uganda were all “founding partners,” and some content scanned at their newly-established WDL digitization centers was included in the launch version of the site.

Following the launch, developing a governance structure for the WDL became a priority. To get the project off the ground, in 2006-2009 the Library of Congress concluded a large number of agreements with WDL partner institutions regarding the use of their digital images and metadata on www.wdl.org. These agreements differed with respect to the wording of key provisions, duration, the rights and responsibilities of the parties, the language of the agreement, and so forth, with variations being the product of the different legal offices involved in the drafting of such agreements. In 2010 the WDL was restructured to become a loose multilateral institution with a uniform set of rules, a permanent governance structure, and a simple statement of rights and responsibilities, including intellectual property rights. These provisions were codified in a charter that all partners were to sign and that was made equally authoritative in the seven interface languages. Adopted in March 2010, the charter provides for an annual partner meeting, an Executive Council elected by the partners, and permanent committees for Technical Architecture, Content Selection, and Translation and Language. The charter also provides for an institutional project manager, responsible for maintaining and building the WDL website, and designates

⁵ “Build It, and They Will Come,” *Library of Congress Information Bulletin*, May 2009, <http://www.loc.gov/loc/lcib/0905/wdltech.html>

the Library of Congress as the institutional Project Manager for the period 2010-2015.⁶ Partners join the WDL by acceding to the charter, in effect concluding an agreement not just with the Library of Congress, but with all of the WDL partners.

Since the early startup phase, the WDL has continued to grow, operating under the terms of the charter. For the most part it has continued along the lines set in the initial planning stage, with some inevitable adjustments in response to changes in technology, user feedback, and partner preferences. Progress has been made on all fronts, and the basic decisions made in the planning stage appear to have been validated, in the main if not in all particulars.

The commitment to multilingualism has paid off. Content on the WDL is in 86 languages, with the most heavily represented languages being Spanish, English, Arabic, German, Russian, French, Chinese, Latin, Japanese, and Portuguese (ranked by number of items; the number of pages/images would yield a different result). More can and will be done in this area, and the WDL especially welcomes content contributions in lesser known and endangered languages.

Providing multilingual access also has been a success. Each of the seven interfaces is extensively used, with the Spanish-language site by far the highest. In 2009, the Spanish-language interface accounted for 33.1% of all pages viewed, followed closely by English (30.6%), French (11.3%), Russian (8.8%), Portuguese (7.7%), Chinese (6.5%), and Arabic (2.0%). By 2011, Spanish had surged even further into the lead, with the Spanish interface accounting for 58.4% of pages viewed, followed by English (17.1%), Portuguese (14.4%), Russian (4.0%), Chinese (2.9%), French (2.5%), and Arabic (1.4%). A key task for the future will be to sustain and continue building on the high levels of usage in Latin America and the Iberian Peninsula, in both Spanish and Portuguese, while increasing usage of the other languages, Chinese and Arabic in particular.

The commitment to universality remains valid. As of this writing (mid-September 2012), the WDL has 159 partners from 75 countries, in all continents and UNESCO regional groups, in both the developed and developing world. This is still a long way from universal participation, but it clearly represents progress in that direction.

Universal content coverage remains a value and is reflected in content selection priorities and the setting of production schedules. The WDL website contains 6,330 library items comprising a total of nearly 300,000 images, contributed by 84 institutions in 42 countries. Some content about each UN member country is included and has been since the 2009 launch. Significant amounts of content from numerous partners are at various stages of the production pipeline, and new partners from additional countries are in the process of joining the project. Comprehensive coverage of all countries is still a long way off, but the project has set a goal of having a minimum of 100,000 rare and unique items on the WDL to provide such coverage.

High levels of usage and user satisfaction suggest that the decisions regarding functionality and user value-added have paid off. On its first day, the WDL received over 600,000 visitors from every country in the world. Since then, more than 21 million people have visited the site, accounting for some 135 million page views. Various web awards have been won, and thousands of user comments have been received, in each of the seven WDL languages, for the most part overwhelmingly positive. Nearly 5 million other sites link to the WDL, testifying to the enthusiasm with which the project has been embraced and ensuring high rankings on Google and other search engines. Total users averaged about

⁶ Information about organization and governance – including the charter in the seven WDL languages -- can be found on the WDL project website at <http://project.wdl.org>.

420,000 per month in 2011, with the highest numbers by country from Spain, Mexico, Brazil, the United States, Argentina, Chile, Colombia, Portugal, the United Kingdom, Russia, and France.

The decisions to standardize metadata and provide item-level descriptions have contributed to the appeal of the project with users, and the choice of technical architecture, originally quite controversial, seems to have been vindicated. Even at its current, still relatively modest size, a search of the WDL for the term “Islam” yields 365 books, manuscripts, prints, newspapers and maps, provided by 21 institutions in 16 countries.⁷ The architecture and metadata enable the user to quickly browse through all 365 items, narrow the search by place of origin, date, language of the document, format, other or additional subject (beyond Islam), and contributing institution. The user can instantly see the full item, zoom in to high levels of detail, access all of the metadata in six additional languages, listen to the metadata using voice to speech conversion, download the content in PDF form, and learn a lot more about the item from the description, written by a qualified expert. These features would be impossible to provide in a distributed system, particularly one involving links to partner institutions in parts of the world still struggling with poor connectivity and low bandwidth.

Sustaining high levels of quality and added value for users will be an ongoing challenge for the WDL. So far, however, there has been no deterioration—indeed the trend has been in the other direction, as quality and standards have consistently risen as the project gains experience and benefits from new contributions from new partners. The launch version of the WDL was developed with a tiny staff and against enormous time pressure. Since that time, the quality of translations has been upgraded by the recruitment of dedicated staff, deployment of new translation management tools, and the putting into place of mechanisms to respond to comments and feedback from users, who are often quick to detect errors and omissions. The quality of the metadata also has been improved, through the recruitment of a full-time professional staff, the development of a new metadata application, continued refinement of standards, and integration of the Virtual International Authority File and other tools into the cataloging process.

The quality of the descriptions has been steadily upgraded. Partners providing content to the WDL have been given better guidance and now have more time to work with their curators to explain their content in appropriate depth and detail, with time and procedures available for back-and-forth between the WDL production team and the content providers to check facts and clarify ambiguities. In the startup phase of the process, many descriptions were written quickly or cobbled together from pre-existing sources. Now, the annotation of certain collections at the item level has become a much larger and better organized operation, encompassing within it several major subprojects that are producing high quality primary research by recognized experts.⁸

Most importantly, the overall quality level of the content, in terms of rarity and cultural and historical importance, continues to rise, as new partners join and contribute marvelous items from their collections. The launch version of the WDL contained a fair share of top treasure content –*Miroslav's*

⁷ Bosnia, Brazil, Egypt, Germany, India, Iraq, Kazakhstan, Lebanon, Mali, Morocco, the Netherlands, Pakistan, Qatar, Saudi Arabia, Slovakia, and the United States.

⁸ Examples include the item-level descriptions for the photographs in two major collections held by the Library of Congress that are on or being added to the WDL: the 1871-72 *Turkestan Album* survey of Central Asia and the *Prokudin-Gorskii* collection of early photographs of the Russian Empire, by Professor William Brumfield of Tulane; annotations of Arabic and Persian scientific manuscripts by academics from Columbia and Cambridge universities; and the annotation of rare Chinese books and manuscripts by retired Chinese-language experts from the Library of Congress.

Gospel from the National Library of Serbia, the famous “Devil’s Bible” from the National Library of Sweden, anthologies of very old and rare Asian materials from the National Library of China and the National Diet Library of Japan, and similarly distinguished content from other partners. But many of the approximately 1,200 items initially in the WDL were included to provide minimal coverage of each of the 193 UN member countries. The latter items were carefully chosen and of generally high quality—mostly maps, photographs, or 18th and 19th century books—but they were not in most cases “top treasures.” This material is now being supplemented by a steady wave of rare treasures from such great institutions as the Bavarian State Library, the national libraries of France and Spain, the Laurentian Library in Florence, the Estense Library in Modena, and many others. It will take some time before all countries, particularly those in the developing world, are represented by the rarest and most important documents from and about those countries, but the trend is in this direction.

The level of quality of the content in the site also has benefited from the designation, endorsed in the 2011 WDL business plan and discussed at the 2011 partner meeting in Munich, of several areas in which the WDL will develop concentrations of important content, working proactively with partners and prospective partners. These areas include Mesoamerican codices, Chinese rare books and manuscripts, Arabic scientific manuscripts, early photographic surveys of empires, and treasures from medieval and Renaissance Europe. The WDL has made great progress in all of these areas, and the long-term potential of this approach can be seen most clearly in the case of the codices, where documents from the 11th to the 16th centuries relating to the history of the Aztec and Mayan peoples have been contributed, so far, by libraries, archives, and museums in Mexico, Spain, Italy, Germany, Sweden, and the United States.⁹

4. Lessons and Implications

So what have been the lessons learned? What about the WDL has worked, and what has fallen short of expectations? And what implications might the WDL experience have for other digital library projects and for the overall theme, “Beyond Access: Digitization to Preserve Culture”? A few conclusions can be drawn.

Multilingualism has been a big success for the WDL, with users if not necessarily with international funding sources. Heavy usage of the Spanish, Portuguese, and other interfaces suggests that, while the volume of content on the Internet in languages other than English has grown astronomically in recent years, there remains a demand for sites that provide high-quality cultural and historical content in a range of languages. International library projects can draw from the WDL the lesson that investment in providing multiple-language interfaces pays off in increased access. But multilingualism is an expensive proposition, and human and financial resources will be needed to encourage and sustain the development of multilingual digital library projects.

The capacity building mission of the WDL has been at best a very mixed success. Staff at the Library of Congress and at partner institutions in Cairo, Baghdad, and Kampala made heroic efforts in 2006-2009 to install equipment and train staff and to scan initial batches of content for inclusion in the launch version of the WDL. Production has continued at these three centers, and various other capacity building activities—training workshops, visits, and the provision of software tools—have taken place. But

⁹ For documentation regarding this focal area, see Mesoamerican Codices Meeting, May 19-21, 2010, Mexico City, Mexico, http://project.wdl.org/content/mexican_codices/index.html.

generally speaking there has not been much interest in or many resources available for expanding digitization capacity in developing countries in connection with this project.

The WDL has called for interested institutions and organizations—WDL, IFLA, UNESCO, and perhaps others—to work together on a comprehensive needs assessment of digitization in developing country institutions and on the development of low-cost solutions and sources of support for implementation. But so far little has happened in this regard, even as documents continue to be destroyed by war and natural disaster in many parts of the world. Capacity building remains, like multilingualism, part of the WDL's core mission and efforts along these lines will continue, but the volume of resources committed by the international community devoted to work in this area has been disappointingly limited.

Judged by user responses and the enthusiastic participation of so many great libraries, the WDL's effort to provide a high level of intellectual and functional added value—metadata, descriptions, translations, and other features—also seems to have been validated and would appear to be worthy of emulation by other projects. Already in 2006 it was becoming clear, and it is even more apparent in 2012, that non-profit cultural institutions cannot compete on quantity with large commercial firms, and especially not with commercial firms able to access vast amounts of free, user-generated content which these firms can then monetize in one way or another. They can compete qualitatively, by presenting and interpreting the treasures in their vast holdings and drawing upon the intellectual capital embodied in their metadata, finding aids, exhibit catalogs, collection guides, and the minds of their current body of curators.

This is the path that the WDL and some other projects have chosen, and one that would seem worthy of emulation. At the very least, it is to be hoped that cooperative international projects such as the WDL will continue to remind people that cultural heritage—what the organizers of this conference have chosen to call the “memory of the world”—must be primarily about content, about the cultural artefacts and information that carry the collective memories of countries and peoples. Whether this will happen remains to be seen. Cultural institutions are under financial strain and trying to focus their available resources. As they do so, many appear to be downplaying their traditional strengths in curatorial and subject matter expertise in favor of a concentration on information science.

Resources are a serious issue. As noted, the WDL did not start out asking the question: how can we use our available funding to create a World Digital Library. Rather, the question was, what should a WDL be and do? The question then became what will it cost and can the needed resources be found to support the effort. This to a great extent remains a question that members of the international community need to debate and resolve, not just with regard to this one project, but with regard to the overall issue of “Memory of the World in the Digital Age.”

Strategies for Building Digital Repositories

A Persistent Digital Collections Strategy for UBC Library

Bronwen Sprout and Sarah Romkey

Abstract

In early 2011, UBC Library began work on creating a digital preservation strategy in collaboration with Vancouver-based Artefactual Systems. UBC Library and Artefactual ran a number of pilot projects to ensure that the strategy is pragmatic, tested, and involves proven technical solutions and business processes that work in our environment and towards our goals. The persistent digital collections strategy developed for UBC Library consists of using the open-source Archivematica digital preservation system to provide preservation functionality for the Library's digitized and born-digital holdings. The strategy identifies the software requirements, existing and new system components, staffing and business processes that can be implemented to establish operational digital preservation systems and processes by the end of 2012. The paper will discuss the strategy generally and cover three areas of implementation in greater detail: UBC Library's Rare Books and Special Collections, cIRcle, our DSpace-based institutional repository, and CONTENTdm, UBC Library's access system for digitized objects.

Authors

Bronwen Sprout is the Digital Initiatives Coordinator at UBC Library. She coordinates the development and management of the Library's locally created digital collections, including digital preservation activities. She has over ten years' experience working on digitization projects and managing digital collections. Prior to joining UBC Library in 2005 as Digital Initiatives Librarian, Bronwen worked as a cybrarian at a dot-com, and as a consultant for small businesses and non-profits, assessing information needs and implementing a variety of web-based solutions.

Sarah Romkey graduated from University of British Columbia's joint Master's in Archival Studies and Master's in Library and Information Studies program in 2008. She has since that time worked in UBC Library's Rare Books and Special Collections division initially as the Librarian and Archivist for the Chung Collection and since 2009 as the Rare Books and Special Collections Archivist. Sarah is responsible in this role for acquiring, providing access to and preserving the archives of individuals and organizations external to UBC.

The University of British Columbia (UBC) Library's digital preservation strategy supports the Library's strategic focus on managing collections in a digital context and reinforces the University's commitment to make UBC research accessible in open access repositories. In 2010, the Library's newly launched strategic plan guided the development of a Digital Initiatives unit and related decisions to hire a Director of Digital Initiatives and to outfit and staff a digitization centre. The Digital Initiatives unit is a key part of the Library's effort to adapt to the evolving needs of faculty and students and to support teaching, research and learning at UBC. The unit's goal is to create sustainable, world-class programs and processes to make the collections and research at UBC available to the world and to ensure the authentic, long-term preservation of these digital holdings for the future. As the new unit became established, one of the obvious functional gaps was a preservation system for digital master files. As we began work on a digital preservation strategy however, it quickly became apparent that there were crucial digital preservation gaps with other Library-created and/or managed material as well.

This paper will address the pilot and early stages of the implementation of UBC Library's digital preservation strategy. The Library has been working on this strategy with Artefactual Systems Inc., the Vancouver-area company behind the open source Archivematica and ICA-AtoM software, since early 2011. The first year of the project was devoted to developing and testing the preservation strategy and included installation and testing of the Library's Archivematica instance and the development of copying workflows and procedures. The second and current year of the project is the implementation phase; we hope to be able to offer preservation services by the end of 2012.

Archivematica is one of the key components of our persistent digital collections strategy. The software "uses a micro services approach to provide an integrated suite of free and open-source tools that allows users to process digital objects from ingest to access in compliance with the OAIS model."¹ Archivematica will provide preservation functionality for the Library's digitized and born-digital material, managing functions and activities such as checksums, virus checking, preservation metadata, and file format normalization. It will interface with our existing systems (DSpace, CONTENTdm, ICA-AtoM) and we will use existing Library staff resources to integrate digital preservation activities into our workflows. Although Archivematica is a key component, our preservation strategy is not solely focused on this software. The strategy also includes software requirements, existing and new system components, staffing and business processes.

Artefactual's initial task in establishing our strategy was to carry out was a gap analysis. The gaps in the Library's digital preservation activities were largely identified using the ISO-OAIS reference model.² The consultants looked at the digital material we were creating or managing locally and, referencing OAIS, asked: "what is not being adequately preserved?" Following that, several areas were identified for pilot projects, including:

1. Rare Books and Special Collections and University Archives – both pilot projects involve born digital records and are working with legacy and newly acquired material
2. cIRcle, our DSpace-based institutional repository – contains more than 40,000 items, mainly theses and dissertations but also a variety of research and teaching materials
3. Digitization projects in Digital Initiatives – CONTENTdm is UBC Library's access system for digitized objects and currently contains about 80 collections and over 200,000 images

Once the gaps were identified, a project team was struck. The team includes Artefactual staff as well as representatives from the areas of the Library identified and/or affected by the pilot projects: Digital Initiatives, Library Systems and Technology, University Archives, and Rare Books and Special Collections. A student assistant from the School of Library, Archival and Information Studies was also a part of the project team and assisted hugely with the testing. The team meets monthly and UBC Library members work closely with Artefactual to test the software and iterate the development of workflows that will integrate with our local practices.

One of the major outcomes of our digital preservation program will be the ability for Rare Books and Special Collections (RBSC) to archive born digital material. The mandate of this division of the UBC Library includes the collection of archival material from private creators about the various aspects of life and industry in British Columbia. As of 2012 the division has in its holdings almost 700 archival fonds

¹ "What is Archivematica," accessed August 16, 2012, https://www.archivematica.org/wiki/Main_Page.

² "Open Archival Information System," accessed August 16, 2012, http://en.wikipedia.org/wiki/Open_Archival_Information_System.

created by a wide variety of people and organizations, dating from the gold rush era to the present day. Since the time when digital technology became ubiquitous in homes and offices, RBSC has acquired born-digital records on external media (primarily floppy disks, CD ROMs and DVDs) only in the context of the media arriving unexpectedly in primarily analogue acquisitions. While this media was presumed to be of archival value and kept with the fonds, one could say that the digital media was not processed in the sense that no attempt to preserve the digital records separately from the physical media was made.

The University Archives division of UBC Library, responsible primarily for university and university-related records, had similarly begun to receive digital media, or requests to acquire digital media, from university departments. In 2011, the archivists from both divisions had the opportunity to participate in UBC Library's persistent digital collections strategy pilot project. The aim for these two divisions in the pilot project has been to develop a method for both processing legacy media in existing collections, and acquiring and processing born-digital material from new or ongoing collections.

After identifying collections in RBSC for which legacy digital media existed, the project team prepared to test the preservation of the files. Appropriate hardware was procured, including a 3.5 inch floppy disk drive and, with more difficulty, a 5.25 inch floppy disk drive. A basic workflow was developed which involved creating a Submission Information Package (SIP) from the files on the external media and feeding it through Archivematica, which would create an Archival Information Package (AIP) and a Dissemination Information Package (DIP) for access in ICA-AtoM archival description software.

Unsurprisingly, technological challenges have abounded during testing of external media, particularly in regards to floppy disks. A number of the disks tested were found to be unreadable, and possibly have been unreadable since their initial accession to the archives. The 5.25 inch floppy drive has proven to be particularly challenging to operate. A number of files which could be copied from the disks have been in outdated formats for which the proprietary software no longer exists. Some optical disks were found to be created from proprietary sources (such as photo finishing stores) which also required proprietary software to open or copy the files, even if the files themselves were in commonly used formats. At this point, we have sufficient experience processing external media ourselves to feel comfortable approaching an external company to take on some of the processing. Our pilot testing has allowed us opportunity to create documentation for several different use cases, including transferring media from optical disks, 3.5 and 5.25 inch floppy drives, and external drives, which we can use to guide future work as well as our negotiations with vendors.

Processing legacy digital media has also raised a number of intellectual problems. One is the arrangement of the digital media into series or files within the collection. Although archival theory and practice tells us that the physical container of records may or may not reflect the intellectual arrangement of the records, the processing archivists who had accessioned these records were limited in their options for arranging the media into series, being unable to separate the records from the media itself. Thus it is not uncommon in our finding aids to find series titled, "Electronic media" or similar. Actual reading of the records through a file viewer often reveals evidence of original order (the principle by which an archivist would ordinarily arrange records into series and files) such as folders and naming conventions applied by the creator. Furthermore, it may appear that records on the digital media share "archival bond"³ with analogue records in the same collection by virtue of their association with the same activity

³ Archival bond is defined as "The network of relationships that each record has with the records belonging in the same archival aggregation." From "The InterPARES Project Terminology Database," accessed August 23, 2012, http://www.interpares.org/ip3/ip3_terminology_db.cfm?letter=a&term=6.

of transaction of the creator. Does one re-arrange the collection into series based on this newly discovered evidence, or maintain the arrangement provided by the first processing archivist? At this juncture, decisions are being made on a case-by-case basis.

It is one of an archivist's core duties to *select* records for permanent retention within a collection. Similar to the challenge of arrangement described above, the processing archivists of the past did not have an effective way of selecting the records contained on digital media, lacking a method for opening the files and inspecting their content. They were therefore only able to use what metadata existed on the label or container for the media and make assumptions about the content. While some disks have yielded archival documents such as book manuscripts and digital photographs of which no other copies are known to be extant, other disks have yielded routine administrative records that would not have normally met an archivist's criteria for retention, lacking sufficient evidential or informational value to be of use to researchers.

Finally, an examination of the rights transferred with the digital material must occur in order to determine the institution's ability to preserve and provide access to the material. While UBC Library's standard donation form for archival material transfers copyright to the institution, understandably not all archival creators are comfortable with such an arrangement and so they are accommodated by transferring the legal ownership of the physical material while maintaining their intellectual property rights. Because this legacy digital media was acquired in a primarily analogue context, no licensing was written into the agreements to allow online access or the creation/migration of digital copies for preservation reasons.

While testing was still occurring with the legacy media from RBSC and University Archives collections, it seemed that sufficient lessons had been learned to pursue what could be considered our "first" born-digital archival acquisition; first in the sense that we proactively sought a primarily born-digital acquisition and would therefore have greater control over many aspects of the acquisition process. RBSC had been approached by a photo-journalist who desired to donate his own born-digital photographs from the past seven years. The acquisition was from our perspective a desirable test case because first, the subject matter of the photographs (fishing boats and fishing practices) complements other collections in our holdings, and second, the donor has been able and willing to give answers to our questions regarding the creation of these images.

The information gathering stage was important in order to address the same issues we had faced with our legacy media project. A questionnaire for a donor interview was developed, adapted from *Born Digital Collections: An Inter-Institutional Model for Stewardship (AIMS) survey for Personal Digital Archives*⁴ and the *Paradigm records survey*⁵ published by the Bodleian Library. While the AIMS and Paradigm surveys provided ample opportunity to ask the donor about his technological and organizational processes, additional questions were added to address questions of rights and access: did the donor wish to retain his copyright? If so, what measures was he willing to allow UBC Library to take in order to preserve and provide access to his born digital records? Were there any rights attached to the records that he did not have the ability to transfer or license to the institution? (See Appendix A for our survey instrument).

The donor's answers to the questionnaire allowed us to prepare both technologically and intellectually for the transfer of the material. From a technological point of view, the feasibility and

⁴ "AIMS Born Digital Collections: an Inter-Institutional Model for Stewardship," accessed August 31, 2012, <http://www2.lib.virginia.edu/aims/>.

⁵ "Welcome to paradigm," accessed August 31, 2012 <http://www.paradigm.ac.u/>.

appropriateness of using digital forensics tools and processes was explored. The donor wished to transfer the records on an external hard drive, which he had purchased explicitly for the purpose of donating his digital records. Initially we felt that using a write blocker, a piece of hardware used to prevent the inadvertent alteration or damage of files and documents when external devices are used to transfer files, would be an appropriate safe-guard. However, it became necessary to delete files from the external drive before the transfer could take place due to an accidental inclusion of files not intended for donation, and so the use of a write blocker became an inappropriate step.⁶ This step was also deemed not *as* necessary as perhaps would be appropriate in other use cases: in the future, we anticipate that entire working hard drives (as opposed to copies of digital records saved to external media) will be imaged in order to preserve the records. In that use case a write blocker would be necessary to ensure the records, being the original records created by the donor, will be imaged authentically.

Based on our experience processing legacy media and the external drive we began to perceive there to be different *levels* of digital preservation that might be appropriate to guide future acquisitions:

Level of Preservation	Use case	Minimum tools
Level 1	Imaging files from working hard drives, directly from creator	Write blocker, file synchronization software (e.g., Grsync)
Level 2	Imaging/copying files from external media	File synchronization software (e.g., Grsync), write blocker if possible
Level 3	Preserving external media only	Hardware necessary to open media (floppy drive, optical drive, etc)

“Level 1” preservation would entail imaging of working hard drives, when a creator is prepared for the archivists to examine all of their digital records and image files directly from their working computer. Digital forensics tools such as write blockers would be necessary for this level of preservation to ensure the authenticity of the original files is maintained. “Level 2” preservation would entail making authentic copies from external media such as floppy or optical disks and external hard drives. Software tools such as Grsync⁷ and functions such as checksums will be used to ensure the copied files are authentic copies of the files provided on the external media. Ideally, a write blocker would be used, but would not be considered as necessary as in Level 1. “Level 3” preservation may be a last resort to maintain bit-level records on external media that cannot be copied authentically due to technological problems. We have developed use case documentation for acquisitions made through external media which include the use of a write blocker, even though it has not been used for this particular pilot test.

⁶ Using a write blocker and making a forensic image of the hard drive contents would have inevitably meant including the files which the donor requested us to delete. We decided that this was not acceptable from a donor-relations point of view.

⁷ “Grsync: Home,” accessed August 31, 2012, <http://www.opbyte.it/grsync/>.

To ensure that we have the necessary rights or licenses to preserve and provide access to the donor's material, we developed a donor agreement form specific to the issues presented by born-digital material. It was our initial hope that our existing donation agreement form would suffice with some alteration. Our realization though was that born-digital acquisitions go beyond the realm of physical, and even intellectual, transfer of material in the analogue world; what is really needed is the ability to gain a license for the rights needed to make copies of records for preservation purposes, migrate the records to new formats now and in the future, and provide access to users either on the internet or through a computer terminal in our reading room. Once again, AIMS and Paradigm documentation provided models, which were combined and modified with additions from a non-exclusive digitization and distribution agreement developed by UBC Library for managing rights associated with digitization projects.⁸

At the time of writing, we are at the stage of using Grsync to copy files from the donor's external hard drive, with the intention of running the acquisition through Archivematica in the fall of 2012. One question that remains to be explored in this pilot project is the extraction of creator-embedded metadata for use in the access system. The creator of the records meticulously adds geographical and subject indexing terms as well as brief descriptions to many of his photographs, which would be helpful for access purposes if they can be re-purposed.

Whereas digital acquisitions are still a fairly minor aspect of RBSC and Archives' holdings, cIRcle, UBC's institutional repository, is solely concerned with digital material. And whereas processing legacy digital media raised a number of intellectual questions, developing the Archivematica integration with DSpace and CONTENTdm has so far raised mainly technical issues.

cIRcle is a DSpace-based open access repository which currently contains over 40,000 items, about half of which are theses and dissertations. In addition to the comprehensive retrospective digitization of theses dating back to 1919, UBC has offered optional online submission of electronic theses and dissertations (ETDs) since 2008 and mandatory online submission for the last year. Thus, the ETDs in cIRcle are considered the University's official copies and were a major driver for the development of a digital preservation strategy for the repository. Because we use a distributed submission model to add new content to the repository, in terms of our digital preservation plan, DSpace will continue to function as the submission and access tool and full preservation management will take place separately in Archivematica. Archivematica will accept submissions from DSpace and preserve them without creating access versions. Submission to Archivematica will take place when submission is made to DSpace, without affecting the user interface. The identifier field (handle) will link the DSpace access record and the Archivematica preservation version. Archivematica 0.8 was designed to recognize DSpace exports and parse them into the Archivematica preservation version.⁹

Though it is not uncommon to refer to DSpace as a preservation system, the software does not have full preservation functionality. Archivematica performs many preservation actions on the DSpace files: it unpackages them, verifies their checksums, assigns unique universal identifiers, checks for viruses, identifies and validates formats, extracts technical metadata and normalizes the files to preservation formats. All metadata are captured as fully standards compliant PREMIS –METS. At this point, a couple

⁸ Readers may also be interested in consulting *Research Library Issues (RLI) no. 279*, recently published by the Association of Research Libraries, which discusses digitization of analogue collections and provides a model gift agreement for mixed intellectual property rights (<http://www.arl.org/news/pr/rli279-7aug12.shtml>).

⁹ "DSpace exports," accessed August 16, 2012, https://www.archivematica.org/wiki/DSpace_exports.

of items regarding the DSpace integration are incomplete; our next steps include a retrospective migration of DSpace content into Archivematica and the development of an automated export/ingest trigger for newly-submitted items (so that items approved for submission in cIRcle are automatically exported to Archivematica).

A companion access system to cIRcle, CONTENTdm is UBC Library's access system for locally digitized objects. The digital collections available in our instance of CONTENTdm date back over 10 years to projects that were created long before the development of the new Digital Initiatives unit or the consideration of digital preservation. Collectively they document a diverse range of people and places, activities and events, and serve as a resource for students, historians, genealogists, and other researchers. The content of these collections is largely drawn from RBSC and Archives and ranges from rare maps and books to historical newspapers to images from British Columbia's forestry and fishing industries. A large part of the collection consists of images which present a visual record of UBC's growth and development over the past century. Like most sites using CONTENTdm, we digitize analogue materials, store the master versions of the digitized objects on network drives and upload the access copies, along with descriptive metadata, to CONTENTdm for public access. In our case, the master files were not adequately linked to our access copies (a filename based on the location of the physical item loosely links the two versions, but is prone to human error). And although we do participate in a Private LOCKSS Network (PLN) that has the capacity to store our CONTENTdm collections, it will not preserve master copies because we do not make them available online for LOCKSS to crawl. Therefore, one of our pilot projects includes the development of an API to link Archivematica and CONTENTdm.

We plan to ingest master digitized objects into Archivematica which will generate the access version for automatic upload into CONTENTdm. The SIP is ingested into Archivematica and when it has moved through to become an AIP the user is given the option of using CONTENTdm to make the DIP available to end users. Two methods for submitting the item to CONTENTdm are available: a one-click import into CONTENTdm as well as the option to save the item as a set of files suitable for importing into CONTENTdm using the Project Client (so Optical Character Recognition can be applied using the Project Client, etc.). Work is currently underway on a bulk DIP upload with metadata attached to each object via a user-supplied CSV file. With either method the regular CONTENTdm approval/indexing needs to be applied before the item appears to end users. Although the option exists to add metadata in Archivematica, most of the descriptive metadata for uploaded objects will be created and edited in CONTENTdm because it better facilitates batch processing. (Descriptive metadata will be added to the AIP by syncing the DIP in CONTENTdm and the AIP in Archivematica.)¹⁰ This will change our workflow considerably as all material will have to go through Archivematica to be added to CONTENTdm. However, we plan to add this step to existing workflows and build the work into existing job descriptions rather than hiring or designating specific staff to take on the role of digital preservation.

Mid-way through 2012, many implementation tasks remain. Archivematica testing is ongoing as are the DSpace and CONTENTdm integrations. A large retrospective project to add DSpace and CONTENTdm content to Archivematica is necessary. We are interested in undertaking a pilot with the Council of Prairie and Pacific University Libraries (COPPUL) PLN we participate in, in which objects ingested into Archivematica would be uploaded to the PLN for distributed, geo-remote storage. We also plan to undertake a research data pilot project using Archivematica to ingest and preserve one or more

¹⁰ "CONTENTdm integration," accessed August 16, 2012, http://archivematica.org/wiki/index.php?title=CONTENTdm_integration.

datasets. We are excited about the potential development of a unified discovery interface for UBC Library digital collections based on the contents of our Archivematica index. Additional effort is needed on our website archiving plan.¹¹ And finally towards the end of 2012 we plan to work with Artefactual to undertake a self-audit based on the ISO Standard for Trustworthy Digital Repositories (an international standard for auditing compliance with the OAIS reference model).¹²

Despite all of the work underway and still to come, we feel we have made tremendous progress over the past year and a half towards implementing a comprehensive digital preservation program. We have a solid plan for our locally digitized material and for the content of our institutional repository in terms of the Archivematica integration with our two primary access systems. Equally as important, we have a greater comfort with and understanding of the challenges around archiving born digital material as the archivists at RBSC and University Archives are anticipating that most, if not all acquisitions in the future will include a born-digital component. Currently, most newly acquired archival collections to these divisions are still primarily analogue, but frequently include external digital media that the donor either created in their normal business or creative practices, or made purposefully with transfer to the archives in mind. This pilot project has helped to solidify what the normal practices and procedures will be, so that digital acquisitions can be more or less systematic, and fewer decisions made on a case-by-case basis.

During the time of our contract with Artefactual, the software was still in alpha. This meant that UBC Library had the opportunity to contribute to the development of the full release (expected for early 2013). We are greatly anticipating this release and are hopeful that our contributions to the development of Archivematica will benefit other institutions as well.

¹¹ Part of our digital preservation strategy is the ability to capture and preserve websites (mainly UBC sites but possibly external sites as well). We tested the open source tool Heritrix, which was developed by the Internet Archive. The software crawls selected sites and stores them as Arc or WARC files. Heritrix comes with a web-based admin module and sites are rendered by Wayback Machine. We found it fairly easy to use but it does require staff time to configure. A similar service called Archive-It is also available from the Internet Archive which includes hosting and remote storage, and this is likely the option we will implement. A major task still outstanding is to assess our library and university websites and decide on the parameters for the crawl.

Appendix A: Donor Survey Instrument

Adapted by the City of Vancouver Archives from *Born Digital Collections: An Inter-Institutional Model for Stewardship (AIMS) survey for Personal Digital Archives* and the Paradigm records survey published by the Bodleian Library and John Rylands University Library, and further adapted by UBC Library.

The survey is designed to be used by the archivist(s) during a face-to-face or phone interview with a donor/creator of born-digital records being considered for acquisition.

Donor name:

Donor affiliation (if any):

Archivist name:

1. Digital Material Creation

- 1.1. Are you the only person responsible for creating your digital files?
 - 1.1.1. If not, who else is involved and what is their role? (for each one list last, first, role [author, editor, secretary, proofreader, admin, ...])
- 1.2. Do you maintain digital files created by others?
 - 1.2.1. If yes, how do you separate your files from files created by others?
- 1.3. Do you separate your personal files from your work files?
- 1.4. What is the earliest creation date (roughly) of your digital files?
- 1.5. What is the latest creation date (roughly) of your digital files?
- 1.6. What software and computer system was used to create these files? Did this change over time?
- 1.7. What kind of camera did you use to shoot these images? Did this change over time?

2. Varieties of Digital Material

- 2.1. What kinds of materials are you donating today? Are they in specific formats (TIFF, JPEG)?
- 2.2. Do you create files in both digital and paper formats?
 - 2.2.1. If yes, which files or file types?
 - 2.2.2. Do you also have prints of your photographs that you will donate?
- 2.3. What do you consider the first, best copy of the file(s)? (this could differ by content type)
- 2.4. Roughly how much of each type exist? (in MB, GB, etc)
- 2.5. Do you distinguish in the files or the filing system between published, non published and re published photographs?
- 2.6. Do you think you will want to reuse or republish the photographs that you donate?
- 2.7. Do you have signed rights or clearances from subjects in your photographs?

3. Digital Material Organization

- 3.1. How are digital files named?
- 3.2. Is some kind of version control used?
 - 3.2.1. If yes, list examples
- 3.3. How are digital files organized? Can you give a brief summary about the organization of your digital files? (obtain classification scheme if available)
 - 3.3.1. Are digital files destroyed in regular intervals?
 - 3.3.1.1. What is the interval? (obtain retention schedule if available)
- 3.4. Do you use more than one computer? (e.g. office desktop, office laptop, home desktop, etc)
 - 3.4.1. If yes, how do you synchronize files between different computers? (server, etc)

- 3.5. Please explain fully your process of adding or creating metadata for your photographs.
 - 3.5.1. Which programs do you use to create metadata in them?
 - 3.5.2. Do you use templates?
 - 3.5.2.1. If so, do you use them for one group, all, some?
 - 3.5.2.2. Is there one template or many?
 - 3.5.2.3. Can we get a printout of your templates?
 - 3.5.3. Do you use the same metadata for all the photos, or do you customize it for all, some, etc.?
- 3.6. Do you wish to retain the copyright for the material you are donating?
 - 3.6.1. What rights are you able/willing to assign to UBC Library (access, migration and copying for preservation purposes, etc)
 - 3.6.2. Are there any photographs for which the copyright has been assigned to someone else (e.g. a magazine, etc).

4. Digital Photographs

- 4.1. Which do you consider the original (jpg, raw, tif...?)
- 4.2. Do you use geocoding?

5. Mobile devices and tablets

- 5.1. Do you use computing devices besides your desktop computer to create this material? (e.g. Blackberries, iPhone, iPad or other tablet, Android phone, etc.).
- 5.2. Do you store photographs on these other devices?

6. Email

- 6.1. Do you have multiple email accounts?
- 6.2. Which email program(s) / service(s) are you using? (e.g. Email program provided by your work place, Outlook, Mac Mail, Hotmail, Gmail, Yahoo! Mail, etc.)
- 6.3. How is email organized? (e.g. in self-created email folders, etc.)
- 6.4. How is email saved? (e.g. untouched in the email program, a copy in your PC, printed out in paper, etc.)
- 6.5. Are email and paper correspondence managed together or separately?
- 6.6. Do you use address books?
 - 6.6.1. Please list address books

7. Digital Files Storage / Backup

- 7.1. Do you have a backup routine for your files / emails?
- 7.2. What media are used for backup files? (e.g. optical disk, hard disk, file server, web based backup service such as SugarSync., cloud service etc.)
- 7.3. How recently have you changed computers? Do you transfer files in your old computer to your new computer
 - 7.3.1. If yes, what types of files are transferred?
 - 7.3.2. Did you encounter any problems in transferring the files?
 - 7.3.3. Please list problems encountered.
- 7.4. Do you keep your old computers?
 - 7.4.1. Please list details. [computer name(s), operating system(s), version(s)]

- 7.5. Have you ever experienced a serious hardware failure (e.g. hard-drive crash, loss of files, accidental deletion)?
 - 7.5.1. If yes, were the files in the affected computer recovered?
 - 7.5.2. If no, would like us to attempt to recover the files as part of your donation?
 - 7.5.2.1. If yes, which ones?
- 7.6. Are any digital files stored in unusual storage media? (e.g. punch cards, 8 inch. floppy diskettes, etc.)
 - 7.6.1. Please list media types.

8. Work Habits

- 8.1. Can you tell us about your work habits of using computers / mobile device? (e.g. work online, work offline, use mobile, etc.)
- 8.2. Do you share computer with other people?
 - 8.2.1. If yes, how are files created by different people separated?
- 8.3. Since a visual representation of working space may provide researchers additional information about your works, do you mind we take photos of your computer with surrounding space?

11. Privacy and security

- 11.1. Are some digital file types of a sensitive nature? (e.g. tax records, medical records, peer-review comments, letters of recommendation, student records, etc.)
 - 11.1.1 Please list categories of files and their restrictions.
- 11.2. Are there files that you would want destroyed?
 - 11.2.1 If yes, please provide details so that we can act upon when we encounter such files when processing your files.
- 11.3. Do any digital files require passwords?
- 11.4. Where are user names and passwords kept?
 - 11.4.1 What service / software are used to save them?
- 11.5. Do you use digital watermarks?
 - 11.5.1 Please list files and watermark rationale.

12. File Transfer Arrangement

- 12.1. Do you want to delete any files / re-organize the files before the transfer?
- 12.2. Are there files you would like to transfer to us later?
 - 12.2.1 Which files?
 - 12.2.2 When?
- 12.3. Can we take the original computer(s) or storage media?
 - 12.3.1 If yes, do you want the original media back once we've processed the donation? If no, we will destroy the original media once the donation is processed.
 - 12.3.3 What storage media will you deliver? [original hard drive, copy on external drive, dvd, cd, etc]
 - 12.3.4 If external drive, how is it formatted? (operating system, version)
- 12.5. Can we make a copy of the entire hard drives or just specific file folders?
- 12.6. Were these hard drives used for anything else, for example personal documents?

Digital Material Survey (Part II)

Note: This part of the survey is designed to be filled out by digital archivists regarding technical details of the tools used to create digital material.

1. Hardware

- 1.1 List the hardware configurations of each computers / mobile device. (e.g. manufacturer, model no, cpu, ram, hard drive capacity, video card, etc.)
- 1.2 Find out if the computers have USB ports or CD writers which could be used to copy the digital files.

2. Software

- 2.1 List the operating system and other system software with version number, installed in all the hardware.
- 2.2 Check if system date and time are set correctly. List the time zone used, if any.
- 2.3 With the help of the donor, list the main application software, with version no., used to create digital files.
- 2.4 If Microsoft Office is used, find out if the “User Name” field is set to the name of the donor. Find out similar setting for other main application software used.

3. Internet Access

- 3.1 Find out if the digital archivist can use the Internet access in the donor’s office using the digital archivist’s portable computer?

4. Networking

- 4.1 With the help of the donor, confirm if the computer is connected to file servers. Confirm if the donor save files in the file server. How much file server space is used by the donor?

5. Security

- 5.1 With the help of the donor, confirm if login is required to access desktop computers / mobile devices?
- 5.2 With the help of the donor, confirm if a digital certificate is used by the donor to login / sign digital files / encrypt digital files?
- 5.3 With the help of the donor, confirm if digital files are encrypted?

6. Comments (per section and per survey)

Building the Business Case for Digital Preservation

Neil Grindley

JISC

Abstract

This paper will describe work that JISC is funding to build an evidence-base of material that will provide a range of organisations with practical and plausible reasons for investing in digital preservation. The SPRUCE Project is leading on the work and is using hackathon-type events and other enabling measures such as disbursing small grants and providing practical technical advice, in order to better engage with stakeholders and elicit accounts of the real challenges that digital collection-holders face on a day-to-day basis. Complementary JISC-funded work in areas such as ‘sustainability’, ‘value’ and ‘costs’ will allow the SPRUCE project to build a nuanced and multi-faceted series of business cases. Case-studies arising from this project will be valuable in their own right, but the genuinely novel aspect of this work will be the assembly of methods used to arrive at convincing and usable arguments to support engagement with, and investment in, digital preservation.

Author

Neil is a Programme Manager at JISC with responsibility for digital preservation. JISC is an organization that funds and supports technology-related projects and services for the UK Higher and Further Education sector and is influential within and beyond the UK as an innovative agent of change. Neil is also currently a board member for: the Digital Preservation Coalition; the Open Planets Foundation; and the Alliance for Permanent Access. Previously, Neil has worked on projects supporting the use of advanced ICT methods for humanities research and was the IT Manager at the Courtauld Institute of Art.

1. Building the Business Case for Digital Preservation

1.1 The Problem

Based on a great many national and international activities over the last ten or fifteen years, there are reasons to suppose that digital preservation is now a well-described problem capable of drawing on a useful range of resources and tools to support practice. It is also apparent that a number of different international organisations and agencies have made a significant impact with helping practitioners across various sectors tackle the challenges inherent in the long-term management of digital information.

However, whilst much has been achieved, a gap and a challenge persist. Whilst the vast majority of organisations are now confident and willing to acknowledge—through a mixture of intuition and logic—that long-term access to (and therefore preservation of) digital materials is an area where thinking, strategy, and perhaps even policy is going to be increasingly vital, insufficient evidence currently exists to help them fully articulate what the nature, scale and scope of the threat to their digital assets is likely to be. To put it another way, they don’t yet have the means or experience to accurately gauge the *value* that digital assets represent to their organisation, and consequently don’t know to what extent digital preservation will serve the long-term financial and strategic interests of the organisation. The question thus becomes, ‘what is the business case for digital preservation?’

JISC has a remit to help UK universities and colleges ensure that they are managing their digital assets in the most effective way possible and part of this task is to support practitioners to be able to make

the case (either to internal decision-makers or external funders) for ongoing investment into digital preservation activities. JISC has therefore recently funded a collection of projects with the objective of building an evidence base that will support practitioners to make that case. The main purpose of this paper is to describe the assembly of methods by which the empirical evidence is being gathered and a useful by-product is to list some of the stated impacts that the projects have identified, which can in turn be assessed for the benefits that have accrued to the organisations involved.

1.2 Obstacles and Methodology

Any considered process to gather information in support of the business case for preservation meets several early obstacles. Firstly, it is clear that organisations will normally be reluctant to freely admit any failures to properly manage their digital assets. Reputation is an important currency for all organisations, public or private, but where the organisation has a remit to act on behalf of the public, and more especially where it has a trusted role around the stewardship of objects, reputation is a very important issue. So it will be difficult to identify and then subsequently disseminate stories where identifiable individuals in actual organisations have made inadequate attempts to manage their digital objects.

Secondly, it is difficult to gather information in the form of case studies and data from people with the simple proviso that the ‘community needs them’, or that it will ultimately be of benefit to the whole community that an evidence-base has been amassed. In the main, people need more motivation and more evidence of the near-term benefits to them to really engage with a process such as this.

Thirdly, and rather fundamentally, the fact that the digital preservation community is alert to the dangers of ignoring digital preservation does not mean that the broader community is necessarily convinced either by its requirement as an activity; or by the terminology and methodology proposed by those advocating digital preservation. This limits the potential sources of information from which the evidence base can be built.

To try and tackle these and other obstacles, JISC issued a call for proposals in September 2011¹ that invited ideas for 3 different types of project. The first strand called for a single project to ‘inspire, guide, support and enable UK HEI’s [and potentially other types of organisations] to address preservation gaps; and to use the knowledge gathered from that support work to articulate a compelling business case for digital preservation’. A mass of anecdotal evidence suggests that professionals working within organisations do not generally want to fill in surveys, or answer questions, or generally meditate *about* preservation. What they really want to do is get on and do something practical about their problems, ideally with recourse to accessible and expert support (on-site if possible) enabling them to tackle some of the specific problems that they are facing in their own institutions relating to the long-term management of information.

The objective, therefore, was to setup a support and enabling project that *actively* engaged and helped stakeholders with problems. This would in turn implicitly facilitate the exchange of information necessary to build the business case evidence base. In effect, the provision of case studies, use case information and stated requirements from stakeholders becomes the *quid pro quo* for the support and assistance given by the project to them. To further enhance the project’s chances of getting engagement from stakeholders, a proportion of the grant (the suggested amount was 20%, i.e., £50,000 from the total

¹ “JISC Grant Funding 12/11: Digital Infrastructure Portfolio,” last modified August 22, 2011, http://www.jisc.ac.uk/fundingopportunities/funding_calls/2011/07/grant12_11.aspx.

award offered of £250,000) was designated as an enabling fund from which the project could itself make small awards of up to £5,000 to institutions that wanted to pursue preservation objectives that might usefully serve as exemplars to the rest of the community.

The enabling grants added a fourth and potentially rich layer for the project to gather appropriate material to use in construction of the business cases. Going from the least to the most active engagement the project can gather data via the following routes (or as a by-product of the following activities):

1. Desk research and literature reviews
2. Interviews, discussions and questionnaires (this activity was not ruled out as a strategy)
3. Active support, advice and guidance to organisations with preservation challenges
4. Enabling grants to cover costs of preservation development activities

The second strand of activity in the JISC Call invited proposals for short projects to address a specified digital preservation problem and to do so within a period of 4 months (Nov 2011 – Feb 2012). The purpose was to set number of projects running that would provide the principle support and enabling project with a small existing stakeholder group which it could work with. It was also meant to ensure that early case study material emerged for inclusion into the evidence base, which would test assumptions around what sort of activity provided the most useful evidence, what kind of output and data would be required, and how effective the whole perceived mechanism would be for achieving the objectives of the call. A total of £75,000 was available to fund between 5-7 projects, attracting from between £10,000-£15,000 each.

In addition to helping the support project, these ‘*Active Case Studies*’, were an attempt to navigate around the first of the three obstacles defined above as hindering the gathering of evidence. Rather than just asking an organisation to tell everyone else about a digital preservation problem that they were facing (a passive case study), this measure also offered them a means to specify and implement a solution to their problem. Giving an organisation the means to fix and own the problem they have admitted to is a different proposition from simply asking them to announce that they have a problem.

The third strand of work was less focused on building the business case for preservation but was nonetheless an indirect attempt to address the third of the three obstacles. The purpose of this strand was to enhance the capability of organisations to more effectively include digital preservation as a component within the information management training and development courses and sessions that they organise for staff and students. This would in effect start to disseminate at least a basic level of preservation knowledge to more people within institutions and over time should result in higher levels of acceptance from more people about the principles, and perhaps the purpose (the business case even) of digital preservation. The call text makes the principle even more explicit,

Part of any embedding process for preservation should involve making appropriate aspects of it accessible and relevant to a range of people across the institution. By drawing out some of the more universally applicable issues around technology obsolescence, media refreshment, bit rot, long-term storage costs and digital forensics, it may be possible to positively influence the behaviour of staff and students within HEI’s to not only store their data more effectively, but to actively manage it, and therefore become more actively engaged with the value of that data and what it may or may not enable them to do.²

² “JISC Grant Funding 12/11: Digital Infrastructure Portfolio,” last modified August 22, 2011, http://www.jisc.ac.uk/fundingopportunities/funding_calls/2011/07/grant12_11.aspx (p. 27)

Given the level of funding (£100,000 for 3-4 projects of 9 months duration) this is clearly a limited contribution to what could potentially be a very large change programme, and one which would need a long timescale to measure demonstrable impact. It is however, an attempt to address part of the problem and it also again mentions the word ‘value’ and expresses the need to convey to stakeholders the idea that part of the challenge of purposefully engaging with preservation is understanding and acknowledging how much *value* digital materials have. This concept features in other areas of work that JISC has recently commissioned and some of this work will be referenced towards the end of the paper—particularly where it has direct relevance to building the business case. However, 12 months on from the invitation of proposals, it is now possible to examine and assess some of the activities that resulted from the call.

2. Projects

The enabling and support project was taken on by a consortium of organisations led by the University of Leeds and is called the SPRUCE Project (Sustainable Preservation Using Community Engagement).³ The principle idea behind SPRUCE continues on from an earlier JISC-funded project called AQUA (Automated Quality Assurance)⁴ which succeeded in defining and running events which brought together digital content specialists and technical developers to tackle real problems in real time (over the course of a 3 day event). These ‘people mashups’ allowed the content specialists to bring problems and questions to the event along with problematic or test data, and gave them a chance to sit down with a developer and work on solutions and ideas. Along with plenary discussion and presentation sessions and documentation that was captured as the event progressed on a dedicated wiki, these events received good feedback and more importantly, produced plentiful evidence that this was an effective way to accelerate the rate at which real problems encountered by those with responsibility for digital collections might be examined and tackled by technical digital preservation practitioners.

Over the course of just 2 events, the AQUA project produced descriptions of work on 24 different solutions to problems in seven categories.⁵ Admittedly these solutions were in different states of usability and functionality but it was clear that as an open and shared community activity and resource, there was great mileage in this form of cooperative problem-solving. Thus, the same approach was proposed for the SPRUCE project and the engagement required of stakeholders to build the business case was designed around further mashup-type events. At the time of writing SPRUCE has run one further event and has added further information about datasets, issues and solutions to the wiki page.⁶

What has become most obvious as a result of the AQUA and SPRUCE project outputs is that they are even more valuable as part of a larger community effort to align similar activities that are being instigated and managed by other entities such as the Open Planets Foundation (OPF),⁷ the SCAPE project,⁸ and the Digital Preservation Coalition.⁹ The information that has emerged from the JISC-funded

projects forms part of a larger body of material that has been brought together under the headings of ‘datasets’ (11 categories/60 items), ‘issues’ (19 categories/159 items), and ‘solutions’ (14 categories/80 items), all of which represents a rich treasure-trove of practical work that either practically supplies a working tool to fix a problem or issue, or at the very least flags up the work-in-progress thought processes that have been applied to a challenge, and may indicate directions for future work.

The URL is on a different section of the OPF wiki from the SPRUCE pages. See: www.wdl.org.

Whilst not yet specifically addressing the detailed objectives of the JISC call to collate and define business cases for digital preservation, it is clear that a great deal of information from a wide variety of sources is being marshalled to declare the type, frequency and scale of problems that organisations are facing in relation to the types of information management problems that digital preservation techniques are designed to tackle. The SPRUCE project is less than half way through its 2 year duration and is due to finish at the end of October 2013.

In the second strand of work, five Active Case Study projects were funded and constitute a diverse range of activities and tasks, all of which have different perspectives that will usefully build the evidence base to justify digital preservation.

2.1. The Carcanet Email Preservation Project

The Carcanet Email Preservation Project aimed to capture and preserve an important email archive and represented a good opportunity for the John Rylands Library at the University of Manchester to begin to engage with complex and emerging practice around a critical area of collections management.¹⁰ The final report is instructive in a number of ways and a good account of the various lessons that can be extracted from a short low-budget project. Sections 3.4 and 3.5 (p.18) are relevant for the evidence base.

2.1.1 Immediate Impact

- For the staff at Carcanet Press, significant progress has been made towards preserving their digital archive, and they are likely to have increased confidence in the Library’s ability to deal with further digital accessions in future.
- The project has ensured the ‘rescue’ for the archival record of a large body of research-rich material which was formerly at risk of loss; several of the files acquired resided only on the hard drives of Carcanet staff.
- The project marked the Library’s first acquisition of a substantial ‘born-digital’ archive, thus enhancing its ability to continue collecting modern archives in the digital age.
- It has improved the confidence of Library staff in their ability to acquire and preserve born-digital archive material, marking a vital first step in practical digital preservation.
- The project has contributed to the advancement of strategic goals, both for the Special Collections Division and for the Library-wide Digital Preservation Steering Group.

⁹ “Digital Preservation Coalition,” accessed September 5, 2012, <http://www.dpconline.org/>.

¹⁰ “Carcanet Email Preservation Project, Final report,” accessed September 5, 2012, <http://www.jisc.ac.uk/whatwedo/programmes/preservation/carcanet.aspx>.

2.1.2. Future Impact

- The project has resulted in a large digital archive which, although currently embargoed, will form a key resource for future researchers—not just those working in the field of literary studies, but also for historians, sociologists and others.
- The ability to deal with born-digital archives has the potential to enhance the UML's reputation as a collecting institution at an international level.
- The University's central IT Services have expressed interest in preserving institutional emails, and may draw on the experiences and outcomes of the project.
- The project will contribute to the growing dialogue about issues involved in the long-term preservation of email.

2.2 The Digital Directorate Project

The Digital Directorate Project, based at the Institute of Education, explored existing digital records management practice within the central administrative function of the organisation (the section producing most of the high-level governance and strategic planning records). The project created relevant documentation including a detailed retention schedule, an overview of relevant preservation metadata and procedures for the appraisal of electronic records. A final report is available.¹¹

2.2.1 Immediate Impact

The immediate internal impact of the project can be summarised as follows (Final Report, p. 8):

- It enabled the records management staff to establish new partnerships with key directorate staff (a highly influential group within the organisation).
- It clarified the organisation's internal committee structure which in turn improved information retention decisions.
- It opened a useful channel of communication between the records management staff and IT staff in relation to secure storage.
- It allowed project staff to become more familiar with the effective use of preservation metadata and the need to adapt standards to meet internal requirements.
- It afforded a chance for staff to develop procedures for the appraisal of electronic records, especially in relation to the acquisition of personal electronic archives.

2.2.2. Future Impact

The Future impact of the project is stated as follows (Final Report, p. 9):

¹¹ "The Digital Directorate: Digital preservation of governance records at the Institute of Education- Final Report," accessed September 5, 2012, <http://www.jisc.ac.uk/whatwedo/programmes/preservation/DigitalDirectorate.aspx>.

- A better understanding of internal committees will allow a substantial programme of de-accessioning to take place. This will be a large undertaking but will result in a streamlined historical archive and more space.
- A much larger programme will now be rolled out across other departments in the organisation based on templates and documentation developed in this short project.
- It will have a long-term and positive effect on the way the organisation uses metadata and how it tackles accession and cataloguing procedures.
- It will inform a forthcoming project in collaboration with the IT department looking at a permanent solution to the secure storage of semi-current electronic records.

It should also be noted that the Digital Directorate project was awarded an enabling grant from the SPRUCE project to continue aspects of its work.¹²

2.3. The Future Proofing Project

The Future Proofing Project was a collaboration between the University of London Computer Centre (ULCC) and the University of London (Archive).¹³ It worked with a simple toolkit of services and software and succeeded in plugging into a network drive to create preservation copies of core business documents that required permanent preservation. It purposefully set out to be a relatively simple intervention that made use of open source migration and validation tools. The case study sought to demonstrate the viability of the approach.

The report is a valuable and clear description of the work which should be of broad interest to a wide variety of people working in IT environments that are expedient rather than optimal. The impact of the project was as follows (Final Report, p. 34):

- The beginnings of a permanent record store
- The creation of a standard University of London position on digital preservation
- A holistic approach that works for many document/record types
- Costs savings, as storage is reduced
- Demonstrating the viability of an alternative approach to EDRM (electronic documents and records management)
- Good for disaster recovery and business continuity—puts set of core documents into a more portable safer place
- Shared drives not abolished, just managed better

¹² Details of all grants awarded to date are available at: <http://openplanetsfoundation.org/blogs/2012-06-08-spruce-makes-funding-awards-digital-preservation>).

¹³ “Future Proofing: enabling practical preservation of born-digital records - Final Report,” accessed September 5, 2012, <http://www.jisc.ac.uk/whatwedo/programmes/preservation/futureproofing.aspx>.

2.4. The Preservation of Publications in Education (POPE) Project

The Preservation of Publications in Education (POPE) Project¹⁴ aimed to reverse the effects of link rot on around 5,000 documents that made up the Digital Education Resource Archive (DERA).

The final report outlines the following future steps that will be taken as a result of the project work:

- A follow-on project has been specified to OCR image files representing text to render them machine-readable
- Work is being proposed to re-index the preserved publications using the London Education Thesaurus (LET) which would allow it to sit alongside content from other databases which had been classified under the same term
- A Preservation Strategy will be developed and plan for the IOE Library and Archives which will include ensuring that the material which has been preserved in POPE remains viable in the long-term
- The IOE Library has undertaken to ensure that all new publications which are accessioned to the library will also be preserved (where licences allow) in DERA. This is only possible because we have saved the time we spent fixing broken links and can now use it more profitably.

2.5. The Publishing Online to Preserve Scholarship (POPS) Project

The Publishing Online to Preserve Scholarship (POPS) Project¹⁵ grew out of a need for low-cost online journal publishing. Academic staff indicated that they wanted to be able to create online, Open-Access journals and sought advice from Learning and Information Services to see if a local solution was feasible.

Whilst digital preservation was not the principle objective of this project, it nonetheless represented a good opportunity to examine the aspects related to the sustainability of scholarly materials. The use of an ePrints repository platform brings material into an environment that has the potential to facilitate digital preservation and plug into relevant tools and methods. (See the JISC-funded Preserv project).¹⁶

3. Complementary Work

Building the business case for preservation is a complex proposition and there are no easily definable boundaries that can be placed around the topic. One of the critical factors that need to be addressed in any

¹⁴ "Preservation of Publications in Education (POPE) – Final Report," accessed September 5, 2012, <http://www.jisc.ac.uk/whatwedo/programmes/preservation/pope.aspx>.

¹⁵ "Publishing Online to Preserve Scholarship (POPS) – Final Report," accessed September 5, 2012, <http://www.jisc.ac.uk/whatwedo/programmes/preservation/pope.aspx>.

¹⁶ "Preserv2/EPrints Preservation Plugins 1," accessed September 5, 2012, <http://files.eprints.org/422/>.

consideration of business cases is the concept of sustainability and how to design strategies that lend assurance and permanence to an enterprise. One of the strong themes to emerge from work that JISC has collaboratively supported on the topic of sustainability—both in terms of the economic sustainability of digital preservation and access,¹⁷ and on the sustainability of projects and project outputs¹⁸—is that it will be difficult to design any long-term future for digital assets and services if their value proposition is uncertain or ignored. The concept of *value* is significantly linked to notions of ‘cost’ and ‘return on investment’ but also has overlaps and connections with other concepts such as benefits, impact, risk, efficiency, etc.

Another very important factor that is difficult to ignore when tackling this topic are the roles and responsibilities of those implicated in digital preservation, i.e., who needs to take ownership of the decisions that are required to manage and sustain digital assets over time, or to fund and maintain the solutions and services that are used for those management processes. An initiative that has tried to think through the relationship between some of these factors (mainly from the point of view of examining prospects for sustainability) is the Economic Sustainability Reference Model. This is a work-in-progress which is seeking to get broad community validation for a framework that will facilitate more thoughtful and sustainable design of measures to ensure long-term preservation and access.¹⁹

Further work on the reference model, on enhancing cost models for digital preservation, and on the other cost-determinants of digital preservation (e.g., risk, impact, benefits, etc.) is planned as part of a forthcoming European Commission funded project that is in the last stages of negotiation. This proposal should allow for intensive work to be carried out over a 24 month period to really help progress a raft of concepts and issues in this field and to join up the effort that a number of projects (including APARSEN,²⁰ TIMBUS,²¹ ENSURE²²) are already expending on different related parts of the conceptual jigsaw.

4. Conclusion

Building an effective evidence base on which to create convincing business cases for digital preservation will necessitate active collaboration with the community. This will best be achieved by a variety of different approaches spearheaded by an expert engagement project or programme that will lead and inspire people to contribute their stories and evidence. The enabling actions that occur in the process of collecting the evidence to illustrate the value of digital preservation may only be supported by modest financial awards of short duration but they appear to foster a desire within recipient organisations to implement lessons learnt more widely and to embrace more methodical policies and processes for information management across the organisation.

Requirements of a Remote Repository

Kevin Bradley

Abstract

In 2007 UNESCO Memory of the World published a report: "Towards an Open Source Repository and Preservation System: Recommendations on the Implementation of an Open Source Digital Archival and Preservation System and on Related Software Development." The paper argued for "digital simplicity" with the expectation that such a concept would lead to an uncomplicated digital repository, which could be implemented and maintained, by small group of talented individuals with a moderate level of technical expertise in a variety of situations. This paper re-examines the notion of digital simplicity and considers whether such an idea is achievable or whether it is nothing more than a form of technical nostalgia, seeking for an imagined simpler times, or the creation of a digital ghetto, with sub standard functionality. It also considers what remoteness means in the digital world, and what are the implications for the systems that exist in such physical, geographical and technical environments. This paper will draw out issues that arise in the seemingly contradictory situation where interaction with the complex is a necessity of participation, but simplicity becomes a requirement of sustainable digital preservation.

Author

Kevin Bradley has worked in the field of oral history, sound archiving and digital preservation for just over 25 years, primarily for the National Library of Australia (NLA). Currently Curator of Oral History and Folklore and Director of Sound Preservation, Kevin's previous appointments include Sustainability Advisor on the Australian Partnerships for Sustainable Repositories (APSR), a DEST-funded partnership, Manager of the Sound Preservation and Technical Services, and Acting Director of Preservation at the NLA. Kevin has been extensively involved in the preservation of general digital objects. For a number of years he managed Digital Preservation at the NLA and worked on the infrastructure project Australian Partnership for Sustainable Repositories. Kevin is a member of the UNESCO Memory of the World Programme, Sub-Committee on Technology.

1. Introduction

In 2007 a paper was published on behalf of UNESCO's Memory of the World Subcommittee on Technology. The paper was entitled *Towards an Open Source Repository and Preservation System*, and it surveyed the open source repository software area, at least as it was known to the author and the research team at the time, to determine whether a narrowly focused, fully OAIS functional low-cost repository system could be developed. The need for this is very clear; all over the world the preservation, digitization and documentation of social, cultural and technical knowledge is being undertaken in the digital domain. It is widely accepted that digital technology in isolation is a fragile media, and proper systems and technologies are required to maintain the content with integrity in both the short, medium and long-term. It is also equally obvious that the technology and systems to maintain that data in the medium and long-term exists primarily in more wealthy countries with large technical infrastructures. The paper stated that such an aim was possible.

This paper, like its predecessor, argues that we have a responsibility to develop appropriately scaled, responsibly safe, digital repository systems with preservation capability in the long-term, and data security in the short and medium terms as being one of its prime criteria. It also suggests that the technology and

information wealthy countries should develop open source, freely available, supported solutions for the issues described in order to enable nations, communities and others to exercise the right and ability to choose whether they wish to maintain and manage their own heritage materials in the digital domain.

2. The Urgency in the Need for a Repository.

All digital information, if it is to be managed and maintained, must be stored in an appropriate system, however there are a number of categories of digital materials with different urgencies associated with the need for a repository. As has been widely discussed, the prime motivation for the digitization of most two-dimensional physical media is access. And as most digitization in the current digital world is a form of access driven image digitization, most of the tools required for dealing with digital information needs are about organisation for access. Libraries and archives throughout the world have been creating digital images of their paper-based collections in order to make the material more freely and widely available, or at least to facilitate local access without damage to original materials. This process has a number of benefits, not least of which is a wide ranging and democratic access to information. The repositories and other digital tools which manage this are designed to simplify the processes and maximise the availability and discoverability of content.

Consequently, with regards to this particular scenario, the primary driver for building long-term data management capability into a repository is the economic benefit that might be enjoyed compared to the cost of read digitising an image collection. Even though it is also possible that in the long-term these image surrogates may well be the copies that out-survive their original sources, the risk of losing an image copy of a paper-based item and not being able to replace it in the medium term is quite low for most paper based material. And as long as paper-based records continue to survive in a robust form, digital repository managers are able to continue with their commonly risky data management policies in which the only likely loss is the cost of recreating the digital images, rather than the content itself. The risk based approach has effectively, if not consciously, been the way most small scale digitization systems operate. As a consequence, the open source digital repository environment has not developed this capability as thoroughly as they have access and dissemination.

However, most sound and audiovisual documents in the 20th century were created electronically, and these machine readable electronic records are now either obsolete or physically decaying due to the chemical failure of the carriers. The urgent need to copy and preserve the content of these items has been well documented and well described elsewhere.¹ In addition, most sound and audiovisual and still images created since the end of the 20th century have been created in digital form and stored on impermanent short term carriers. Most contemporary collections are acquiring original digital photographs, sound

¹ Dietrich Schüller, "Preserving the Facts for the Future: Principles and Practices for the Transfer of Analog Audio Documents into the Digital Domain," *Journal of the Audio Engineering Society* 49, no. 7/8 (July/August 2001): 618-621; Kevin Bradley, "Critical Choices, Critical Decisions: Sound Archiving and Changing Technology," in *Proceedings of the Pacific and Regional Archive for Digital Sources in Endangered Cultures*, 2004, ed. Linda Barwick et al. (Sydney: University of Sydney, 2003); IASA Technical Committee, *The safeguarding of the Audio Heritage: Ethics, Principles and Preservation Strategy*, ver. 3, ed. Dietrich Schüller, 2005 (= Standards, Recommended Practices and Strategies, IASA-TC 03) (South Africa: International Association of Sound and Audiovisual Archives, 2006); IASA Technical Committee. *Guidelines on the Production and Preservation of Digital Audio Objects*, 2nd ed., ed. Kevin Bradley, 2009. (= Standards, Recommended Practices and Strategies, IASA-TC 04) (Australia: International Association of Sound and Audiovisual Archives, 2009).

recordings and video, without a clear pathway to manage them. So, where these documents are important, and it is necessary to maintain them, the repository which holds this material will be responsible for the only copies of these fragile virtual items. The future will not have access to most of the original carriers, but will have access to the content only through digitized facsimiles of managed data or files of the original object.

Large-scale data repositories and the National collections in the developed world manage the data in the same way as the banking environment that pioneered the approach; that is sophisticated and expensive storage management systems in an integrated data environment using multiple types of media and backed up by an IT team or contractors to undertake those tasks. However, these large-scale systems do not tend to scale down, and are not common in the smaller scale, remote collections, or collections in underdeveloped or developing countries because of the cost and the local infrastructure. So the urgent need for an open source repository system which incorporates preservation quality data management and backup is because those repositories to maintain these vital documentary materials need to maintain them as the sole source of otherwise lost materials.

Also equally clear is that the repositories of digital information are only as trusted, or as trustworthy, as the institutions that maintain and house them. So while it is important to create the technology that will allow long-term preservation, this will only be efficacious where the institutions that own and create those documents take on that role for the continued maintenance and existence of the content of those materials. Even though this paper argues for a widely available, reliable and low-cost system that could be easily deployed in a remote or technically less sophisticated environment, it also recognises the limitations of that aim. For a repository to be sustainable it must exist in associated technical infrastructure that is capable of supporting a functioning and sustainable system. Similarly there must be some level of technical knowledge and lease some recurrent resources, albeit at lower level, to make it sustainable.

3. The Outcomes of the 2007 Report

The report, *Towards an Open Source Repository and Preservation System*, was based on a set of industry understandings which by and large could be considered fairly common sense. Listed below are some of the points which informed the document. Underpinning this fairly broad statements was a plea for solving the digital preservation problem for small-scale repositories in a way that dealt with the majority of simple or basic digital objects. This statement was required because it was recognised that much of the work being done in digital preservation is solving the long-term sustainability issues for some very sophisticated technological objects. However the very complexity of the problems such expertise are trying to solve often excludes simpler systems and solutions which might be applied to the majority of formats that are used to document and record cultural materials generally. In the case of the digitization programme, the organisation has control over the formats and so even simpler solutions are potentially suitable.

- Create and store the content on a digital file in a format which does not apply any form of manipulation which causes data loss or loss of authenticity.
- Use a format which is widely implemented and supported, and preferably, though not necessarily, open or non-proprietary.
- Use a format that has a potentially long life (digitally speaking).
- Use a format that is most likely to have available migration pathways to the next format.

- Store enough metadata to be able to facilitate identification, access and preservation processes.
- Use a reliable storage format on at least two types of carrier.
- Make multiple copies, and check and verify them regularly.
- Plan to replace carriers and software as the market demands, and plan to migrate the content to the next type of reliable carrier.

The notion of digital simplicity, as discussed in the 2007 UNESCO paper, is appealing because it implies a simple long-term preservation plan. However, such a simplicity would be too great a cost if it were at the expense of providing access to significant content. Rather I wish to show that the notion of digital simplicity is embodied in a series of concepts regarding formats, content and their relationships, which when applied to long-term digital preservation increases the likelihood of survival of the content embedded in these formats. Digital simplicity can be considered at two levels; the level of the object which is being managed; the level of the repository which is being deployed to manage that object.

One of the main complexities, and one that has frustrated many thinkers about digital information, is identifying the actual characteristics of the digital object that need to be preserved. When looking at complex, computer-based or web deployed digital objects, it is difficult to distinguish between the information the object carries, the media or format that carries it, and the manner in which that object presents the information it carries. The media is, after all, the message, and as a consequence detaching the significant properties, or the essence, of such complicated digital objects is difficult. When the meaning embodied in an object is embedded in the objects, the relationships between other objects, and the way those objects are presented, the complexity multiplies. Virtually all modern web publication fall into this loosely defined category of complex materials. The technical implications of this is that being unable to define precisely what is the essence of an object, it becomes nearly impossible to design the systems which manage the long-term preservation of those characteristics.

The National Archives of Australia describes a number of categories of material which it takes into its digital repository.² They are listed below. Note however that they describe categories of material from the point of view of format or encoding information, rather than user categories.

- Archive files/wrapper/container
- Audio
- Computer aided design (CAD)

² Allan Cunliffe, (2011). "Dissecting the Digital Preservation Software Platform, Version 1.0 (RKS: 2009/4026)," National Archives of Australia, accessed August 2012, http://www.naa.gov.au/Images/Digital-Preservation-Software-Platform-v1_tcm16-47139.pdf.

Of these audio, image and video might be construed as simple digital objects, and text may in certain circumstances be the bridge between simple and complex objects. There are a number of ways of looking at this; of which the first may be with regard to significant properties. JISC defines Significant Properties as follows:

Significant properties, also referred to as “significant characteristics” or “essence”, are essential attributes of a digital object which affect its appearance, behaviour, quality and usability. They can be grouped into categories such as content, context (metadata), appearance (e.g. layout, colour), behaviour (e.g. interaction, functionality) and structure (e.g. pagination, sections). Significant properties must be preserved over time for the digital object to remain accessible and meaningful.³

The significant properties of an audio file is in fact its audio characteristics, that is, if the process sets out to preserve an audio file it must preserve the complete technical/quality characteristics that embodies it. Similarly, this could be said of still images, and to some extent moving images as well. The significant properties are technically embodied in the quantitative measure of their quality. Text based documents are complex symbolic items that human society has been creating and adding to over the millennia. While it is quite possible to show examples that embody that complexity, our long familiarity with such objects allows us to make some pragmatic decisions about font, layout and spacing, and so read and preserve some fairly basic digital objects in text form. However, there is recognition that for most text objects, its significant property would be the information embodied in the text rather than other characteristics.

All other items in the list are a complex mixture of text, technology, relationships, files, standards and components that seems to defy a simple and automated way of being managed. So a simple digital object may well be one that the significant properties can easily, and technically, be separated from the media that carries it.

In addition to this, most of the formats associated with the simple objects described above have had a relatively long life, in digital terms. So, for example, image and audio formats used for preservation have been stable and standard for the past decade and a half. This is because the professional industry tends to resist change, unlike the consumer market which tends to embrace it. Likewise, professional involvement in the format means that there will almost definitely be a migration path from the old format of the new professional format; otherwise the market providers would find it difficult get the buy-in of the professional user.

These formats, all these categories of material, are often the primary source materials from which other more complex objects are created. They are also most often the primary documents for which most archives collections have the greatest responsibility, which carry the most significant information. So, a repository which exhibits digital simplicity would be one that deals with a limited number of files that exhibit characteristics described above.

Digital simplicity does not mean a technical ghetto, or a backwater which remains the same while the rest of the world changes, rather it implies an appropriate technology for the preservation of significant representational items which fall into a defined category, and which are the most significant for many archives.

³ JISC. “The significant properties of digital objects,” last modified 17 August 2010, <http://www.jisc.ac.uk/whatwedo/programmes/preservation/2008sigprops>.

The Towards an Open Source Repository and Preservation System (2007) report made a recommendation for UNESCO's involvement "in open source software development on behalf of the countries, communities, and cultural institutions, who would benefit from a simple, yet sustainable, digital archival and preservation system," and to this end the Information for All Programme (IFAP), at the recommendation of the SubCommittee on Technology (SCoT), provided funding for the development of certain functionality, for which Archivematica won the project.

The Open OAIS defines Data Management, Ingest, Access, Administration, Preservation Planning and Archival Storage. The report also noted that most repository software was well developed in the areas of data management, ingest, access and administration, but little no work had been done in preservation planning and archival storage. The intention of the 2007 report was to create a repository which included the potential to manage All six of the OAIS categories.

To this end of the work undertaken by Archivematica produced a set of repository tools that that met that criteria in five of the six OAIS categories. Perhaps most significant was the inclusion of PREMIS metadata which enabled preservation planning in a way that was not possible with other open source systems. However, data storage remains an unresolved issue.

Most large-scale repositories buy large-scale data storage systems, and enter into some sort of arrangement with companies to supply the technology, software and data tapes. As has been previously stated, this sort of arrangement does not scale down well to a small-scale repository, represents a significant expense even on large, comparatively well resourced repositories and is much more expensive per gigabyte of storage when the repository data size is not great. The 2007 report looked to find a cost effective alternative.

At the time of writing (2007) the report stated that AMANDA, (Advanced Maryland Automatic Network Disk Archiver), an open source system which allows the IT administrator to set up a single master backup server to back up multiple hosts over network to tape drives/changers or disks or optical media, had potential to be incorporated for this purpose. Since that time the AMANDA system has been developed significantly and so has even more potential if it were incorporated into a repository system.

However, the data management landscape has also altered significantly, and it is worth reviewing at this time the options for managing data in a small-scale, tightly resourced archival digital repository.

There are a number of technical and socio-technical ways that a tightly resourced repository can ensure the medium to long-term integrity of the data it holds. We will consider some of those below; repository management partnerships, third-party providers, cloud storage, disk only and disk/tape systems. However, it is important to recognise that no media will last forever, and no data storage technology is reliable, rather it is the technical system that incorporates the technology that provides the reliability. The second aspect to recognise is that all data storage systems are at heart, a risk management technology, and the task is to find an appropriate technology which addresses appropriately the level of risk for the content the system manages and preserves and the environment in which it operates. All these technical systems are based in a particular environment, and we have to interact with that broadly defined system to fulfil all the tasks of a digital repository; collection building and management, preservation, and dissemination. In order to retain and sustain our collections we must create a continuous link between the present and the future, a link that ensures that the ongoing links in the chain of sustainability create a digital object that the future user can access in just the way we do now and does so in the specific social, political and economic circumstance in which it exists.

The archives, libraries and other knowledge keepers are dependent on these sophisticated technical systems and networks that are the pinnacle of our socio-technical capabilities. This means that the future

of our digital and digitized materials are linked directly to the ongoing and continuing support of the government and other organisations which fund our archives and collections. It is no overstatement to say that we are linked to a continuing civilisation.

More importantly, or perhaps just more urgently, we are linked to the ongoing economic and social stability of the societies in which we live and at risk when that stability is threatened. In the current, and seemingly ongoing international financial crisis, it is very concerning to realise that the greatest risk to our collections is not technical or chemical, is not related to magnetic domains, to optical surfaces or chemical solutions, but rather to the economic viability of the societies in which we live. Without ongoing funding, infrastructure and support, our collections are at risk. When considering the appropriate approach to collection management and preservation, we must take note of the social, cultural and economic environment in which that technical system operates. We must create systems that can be sustained in the economies in which they operate.

Repository management partnerships: it may well be appropriate to take all data held in a repository and back up that content in a partner repository that has the highly reliable, low risk, well resourced solution to the management of content. This effectively moves the risk out of the local storage environment and into the storage environment of another, remote place. The issues associated with this are by and large not technical, but rather those of the ownership of content and the property at cultural rights associated with it. Many national or nationalistic institutions tend to resist this, feeling quite rightly that they should be able to manage their own cultural information. Nonetheless, a very good relationship also has the effect of storing data in two quite separate areas, probably separate countries, which has an enormous advantage in protecting content against disasters. However, once crossing national borders and outside of national jurisdiction, other laws may apply to the content with regard to rights and ownership. Trust is probably the most significant aspect of this sort of relationship. However, when it comes to economic motivation, one of the flaws in the approach is that the repository that has the responsibility to maintain and manage the material is not the one that has the motivation to do so.

Third-party providers: There are an increasing number of commercial providers who will manage storage of digital content. Some of these provide very high quality, reputable systems, that replicate those found in the major national archives and libraries around the world, or indeed, exceed their capabilities. Some do not have those types of technical redundancies and capabilities. Besides assessing whether such suppliers meet the technical requirements of the repository, and whether the content they provide is managed with appropriate regard for the ownership of the original content and the legal constraints of the country from which they came, there is a need to negotiate a contract shall agreement regarding the quality of the data, an export and retrieval requirement in the case where either the storage company fails, or the content owner is unable to pay storage fees.

Technical solutions: “May all your problems be technical” Ancient I.T. worker blessing.

Cloud storage is the distribution of data and information across a number of storage environments, which are accessed, managed and controlled through a wide area network. The appearance of a single storage environment is created through a virtualiser, which keeps track of all the parts of the storage environment and renders it as a virtual storage system. Typically there is, or should be, a very high level of redundancy to manage the complexities of multiple storage environments. As can be seen, Cloud storage does not use any new storage technologies, but rather exploits the availability of a widely distributed high bandwidth network and uses the same storage technology as everyone else. Cloud storage hides the fixed

infrastructure and allows the marketplace to respond more flexibly to changes in demand for data storage. Cloud storage also can enable total cost savings because the fixed costs of maintaining a system are spread across multiple users.

However, the security risks associated with data stored in multiple environments, and discussed above for partnership storage, is multiplied by the number of storage environments, the crossing of national boundaries, and the transmission of that data across multiple environments. Like all aspects of data management these risks need to be considered and managed.

The same architectures and data models that underpins the OAIS apply to data stored in the Cloud in the management of long-term preservation of digital objects. There are also management risk and The National Archives of Australia have released a document entitled “A Checklist for Records Management and the Cloud”⁴ which highlights issues around security, authenticity, completeness, discoverability and access, and variability due to data management, copying and migration. David Rosenthal’s blog about the announcement of Glacier, and Amazon based storage environment, raises issues about latency and the cost of access over a given access threshold of around 5% per month (which means that retrieving an entire archive may take a long time, and/or cost a significant amount of money).

However, the most significant issue for an archive situated in an environment with limited infrastructure is the bandwidth of the connection to the network. The objects stored in digital repositories for long-term preservation tend to be very large, especially for audio and video items, and these items require high-speed large bandwidth networks to distribute the content around. As has been discussed widely, the connection speeds in developing countries can be very slow, and may be unreliable. In these circumstances a Cloud storage environment will be totally impractical.

Disk only storage: there is an increasing opinion that storing data on disk (spinning disk/hard metal) in RAID arrays is suitable for collections of significant and important data. Certainly hard disks manufactured in the past few years have better specification and performance characteristics than those from an earlier period. Nonetheless, numerous papers point to the failure of disk storage in critical environments, and the likelihood of data loss.⁵ Complex modelling of real-world failures point to a likely loss of data even when stored on disks configured in RAID. In big arrays, the likelihood of data loss is even greater as the multiple failure and replacement occurrences increased the likelihood of two failures in a single array. The conclusion of many such forums and discussions is to store your data in at least three different locations and to continue with the old advice of different types of media. It is also salutary to observe that most major archives still use tape and disk to maintain the integrity of the data.

⁴ “A Checklist for Records Management and the Cloud,” National Archives of Australia, 2011, last modified 2012, <http://www.naa.gov.au/records-management/publications/cloud-checklist.aspx>.

Disk and tape, with multiple copies on tape, meets the requirements described in “Towards an Open Source Repository and Preservation System,” and remains a requirement for the small scale, tightly resourced repository described therein. As a consequence, there is a need to find funds to develop the incorporation of this into standard open source repository systems. The requirement is specific to those repositories in developing countries for all the reasons described above. However, it is not a requirement that is likely to be implemented for a well resourced repository even if it is using the same open source repository software. This is because well resourced repositories in the economically leading countries tend to be implemented and deployed within existing technical systems, using existing IT infrastructure and staff expertise. As a consequence, developing country is implementing open source repository software will not be able to piggyback off the developments required by their richer counterparts. As most repository deployment in these environments also includes new technical infrastructures, the cost barrier to establish a reliable sustainable repository is more significant in these cases.

4. Conclusion

There is still a need, especially in small scale, tightly funded digital repositories in archives in developing countries to find a solution to medium term data integrity, and to build that into the open source systems that are available. However, because the primary motivation for this comes from an underfunded sector, there will be a need to find grant funding to implement this necessary requirement as it will not come from the commercial sector as a response to its need, not the market generally.

Digital Forensics for the Preservation of Digital Heritage

Accountability for Archival Digital Curation in Preserving the Memory of the World

Wayne W. Liu

Department of Computer Science, Florida State University, USA

Abstract

Diverse parties empowered by the Internet and digital technologies are documenting events and publishing records, joining historians and archivists in collective memory formation. Democratized and inclusive collective memory provides robust checks and balances to official archives, and it reserves a way for future reprisals or reparations. Consequently, preservation takes a new meaning in this regard. In order to conform to historical mandates and eradicate falsehood, archival digital curation needs normative guidelines to include active selecting and updating in addition to passive safeguarding. We propose an accountability model to be the simpler and more succinct basis of new criteria and norms. We summarize four principles of accountability as: identification, authorization, attestation and retribution. Those principles help to transcend differences and resolve conflicts in historical cooperation to preserve more objective, true and just Memory of the World, which in turn will improve the accountability of nations and transnational organizations in World Politics.

Author

Wayne W. Liu received his Ph.D. in Computer Science in 2011, from the Florida State University. His dissertation, entitled “Trust Management and Accountability for Internet Security,” reflects his research interests in issues about Internet security and governance. He currently is an adjunct instructor at Thomas University. He loves God, dogs, arts, tennis and also has broad interests in law, literature, philosophy, and classical music.

1. Introduction

Memory of the World (MoW), like history or archives, is necessarily selective. Archivists take responsibilities to filter, determine and sort out a vast amount of information and disinformation to document events and reflect the minds, wills, deeds and background characteristics of those involved. Historians trust archivists to take custody of such records so they in turn can select, exploit, explicate and vitalize “historical facts” (Carr 1961). What happened in the past then can be preserved as wisdom or *collective memory* (Halbwachs 1992) to help mankind shape future. In theory, such educative purpose is noble and valuable as it helps humanity avoid reoccurring flaws and mistakes. But, in reality, undertaking such responsibilities can hardly be a straightforward endeavor that is totally objective or independent.

Historians may take pride in ethics and professionalism when standing up against outside influences to exercise best interpretive discretion on the authenticity, veracity or validity of written documents and verbal communications. Yet they may not be able to detect or overcome their own myopic ideologies or biased beliefs if any of such interferes with their work. Archivists share similar limitations in their duties and responsibilities. As they strive to draw right decisions and fair judgments for purpose-driven narratives, they may well be limited by the lack of funding or lack of access to restricted information sources. Important information may not survive the manipulation and control of powerful individuals, organizations or regimes if they have conflicting interests in dictating the sources and channels to get the outcomes they desire. In the past, limitations imposed by the powerful or self might have undermined

historians and archivists' efforts, causing history to be inevitably clouded or skewed, redacted or whitewashed to some legendary tales or reduced to propaganda of little or no trustworthiness, only to be rewritten by later historians or rulers, repeatedly.

Now, modern digital technologies and the Internet have given societies, particularly the archival and historical communities, the needed capability and an unprecedented opportunity to change that. Since, now, with the help of information technologies, the generation, preservation, protection and access of digital records can be made autonomous, ubiquitous and robust. Diverse parties now join historians and archivists in documenting events and publishing records. Their collective efforts to spread truths and shape memory across political, ethnical or other artificial boundaries cannot be easily dismissed by the powerful, giving historians and archivists a leverage to counter undue influences. Were historians and archivists in government institutions under political pressure, say, unable to maintain truthful accounts or stand by justice, such *collective memory* serves to provide checks and balances and reserves a way for future reprisals or reparations (Wallace and Stuchell 2011). So, knowing it or not, the nature of historians and archivists' tasks is no longer as vulnerable or subjective as before.

On the other hand, new technologies bring new challenges. The non-stop, unending flood of digital data from computers, networks, surveillance or mass communications, etc., are unlikely to be used again as a whole. Yet, it's prohibitively difficult to sift through such data streams and decide which pieces are, or will be, valid and important *records* (Duranti 2010) or which records have historical values can add to current archives (Cox 1994). So, instead of selecting and updating, new archival facilities are created to accommodate, not to use but to store, the huge amount of data that may vary in format, expanding in size. As digital technologies rapidly evolve, new expertise and resources are needed not only to deal with the new technologies but also to convert and transfer records stored with old technologies into the new formats. But, unless there is political incentive or financial support, ordinary archives may not get the preferential treatment to benefit from the state-of-the-art technologies but remain as is. Since it will be increasingly difficult for the archival institutions to keep multiple sets of expertise and resources in order to maintain these archives, these likely will risk obsolescence of technologies when the old technologies used to maintain these become unavailable over time (Hedstrom 2001). These archives are marginalized in a way as they are forced to retire from public access. Whereas those archives privileged to be converted because they are favored by the powerful likely will be showcased by the archival institutions, along with those new "archives".

When decisions on which archives to be transformed or transferred are based on political or technological dictations rather than on historical merits, and when archives are categorized and divided by media or formats rather than by contents, archives will be increasingly maintained by technicians oblivious of archival missions and values. Because the more resources devoted to maintain technologies, the fewer can be allocated to maintain contents, archivists and archival institutions are forced to retrieve from their active role in *collective memory* formation (Brown and Davis-Brown 1998; Wallace 2011) back to a passive shop-keeping role, yielding to budgetary manipulation or other undue influences of the powerful (Schwartz and Cook 2002) again. In the light of South African's apartheid-controlled archives (Sachs 2006), this may not be a healthy development for archivists, historians or for societies at large.

2. Archivists & Digital Curation

The trend of *digitization* in archival communities renews the awareness of *preservation* and gives rise to recent focuses on digital curation (Lee and Tibbo 2011; Yake, et al. 2011), which Elizabeth Yake (E. Yake, Digital Curation 2007) summarized as:

[T]he active involvement of information professionals in the management, including the preservation, of digital data for future use.

Based on Yake's brief description here, however, it is unclear how archivists or archival institutions are related to digital curation unless we can make a direct connection between archivists and *information professionals*. On exploration of such possibility, Lee and Tibbo have elaborated six dimensions in their *DigCCurr Matrix* of Digital Curation Knowledge and Skills, and suggest "archivists can take advantage of these connections to advance the archival enterprise" (Lee and Tibbo 2011). Specifically, they point out the connections are in *preservation*; i.e., archivists as information professionals must actively take responsibility of preservation in digital curation.

Nevertheless, the notion of active involvement in Yake's description seems to suggest archivists to participate more in the technological aspects of digital curation activities rather than focusing on their historical roles and duties. Most of the current discussions on digital curation and the fledgling education programs and academic curriculums also seem to presuppose a normal or political, social and ethnical stable environment to develop normative disciplines that focus more on technological or managerial knowledge and skills and less on the moral or ethical aspect of digital curation as if it's not an issue. Whereas the case of South African's apartheid-controlled archives (Sachs 2006) suggests that ordinary archival responsibilities conceived under such presupposition may not be sufficient to resist or counter corruptions in political, social or ethnical unstable environments where archivists and archival institutions are expected to play a significant role as a witness or monitor, or a historian, to stand up against the atrocity or injustice of the powerful, to witness and preserve evidence and proof for future recourses, reparations or retribution. We think talking about digital preservation in terms of how, without focusing on what to preserve and why, is a wrong way to answer the challenges of digital technologies. In fact, it probably can help archivists to really take the opportunity of technologies if we put focus on what and why when talking about how to use digital curation to make archival work more independent and meaningful.

Specifically, we think information professionals should serve archivists, not the other way around. Yes, archives can be part of digital curation; and an important part if you will, but an archivist's responsibility in its fullest and truest sense is much more than an information professional's responsibility. When archivists involve in digital curation, we should consider the meaning of preservation in terms of preserving the true and just Memory of the World as opposed to preserving everything. Archivists and archival institutions should not be dictated by insurmountable amount of digital data or the perpetual upgrades and updates of modern digital technologies. Rather, archival missions and values should reflect collective memory in general and the Memory of the World in particular. To this end, one important issue of digital curation---the controlled destruction of archives---remains not fully addressed. The *Reference Model for an Open Archival Information System (OAIS)* (Consultative Committee for Space Data Systems 2012), for example, in describing components and services required by archival institutions does not mention archive selection, appraisal, disposition, destruction or removal (Lee and Tibbo 2011).

As Pierre Nora has pointed out, using memory as a metaphor for archival work, the natural formation of memory is “remembering and forgetting” (Nora 1989). He even said “the indiscriminate production of archives is the clearest expression of the ‘terrorism’ that hijacks memory, and “while amateur archivists tend to keep everything, professional archivists have learned that the essence of their trade is to exercise controlled destruction” (Nora 1989). There is a difference between “keep everything” and “produce archives”. And the imperative of our epoch is the latter, not the former, or at least not just the former. Archives are not just storehouses or junk-dumps where you put some superfluous, no longer needed yet maybe can be recycled, objects there just in case these will be of some use again one day in the future. The true meaning of *preservation* is not to keep everything.

But, in practice, maybe it is! If keeping everything is the only way to preserve something. Here we see how digital curation can come to play and be used by archivists for historical merits. It is not important whether you keep everything or not. What’s important is there are “things” that must be preserved by archivists and archivists can use digital curation to achieve that preservation. Such preservation against, say, intentional erasure by the powerful must be done consciously. You almost can sense the danger when an archivist hides that something in a junkyard or storehouse, or in an archive, in order to safe-keep it as evidence or proof. This is what we need in archivists and archival institutions in case political or social corruptions make it extremely important to keep that evidence or proof. But those are extreme cases, i.e., we must see corruptions as exceptions not the norms. In normal situations, when archivists and archival institutions are not under undue influences, they should not store everything if that pollutes or muddles up archival presentation hence dilutes the values of archives and the effectiveness of preservation thus affects their more important historical mission, function and purpose, which is, in our opinion, to truthfully reflect the collective memory of social justice.

3. Archivists’ Responsibility

Archivists are unique among information professionals as they are hired specifically for preservation so they have the privilege to contribute to a “higher” cause--the preservation of collective memory. For this historical responsibility, competent archivists shall use digital curation with discretion to guide their daily responsibilities in promoting the cause. They are not confined to pragmatic doctrines, like keeping everything or not, because they need flexibility to use curation for such purposes. And this is true for all archival activities. Although archivists differ from other professionals in this regard, they do carry out duties and responsibilities; do conform to professional disciplines and ethics to be *responsible* in decisions and actions with loyalty and obedience, just like other professionals do. As for their exercising of discretion, this won’t be a problem since under normal circumstances their professional roles do allow some autonomy, delegation and maneuver. So, usually archivists should be able to work “wisely” as information professionals and follow professional disciplines and ethics to fulfilling their daily job requirements and the higher calling at the same time to contribute to the cause of preserving collective memory.

But exercising discretion can be a problem under abnormal circumstances, where *exceptions* occurred such as social or political injustice, atrocities, corruptions, or deceits, etc. When archivists’ historical responsibility calls for actions to serve the higher cause in such situations, those powerful individuals, organizations or regimes who committed the wrongs may block the calling in order to hinder the preservation of truth and the eventual justice. At this point, archivists are on their own, their professional disciplines and ethics won’t help because these likely were not developed to deal with such

situations. The professionalism may in fact conflict with the call for actions. So, archivists are left alone to make a choice.

They can either keep their disciplines and ethics, but give up their discretion or be oblivious of the wrongs as if nothing bad had happened but content to be *responsible* to work diligently, loyally and obediently, hence secure their jobs but fail their historical mission. Or, they can divert from the now inappropriate disciplines and ethics and realign their sense of duty and responsibility with the historical calling, to use discretion and their proficiency in digital curation to resist, counter, or record those exceptions, willing to be held *responsible* for disobedience or disloyalty in order to be *accountable* for their historical role but, then, may risk their jobs. Facing such a dilemma, nothing in the archivists' professionalism can guide their choice but their own subjective rationality, commonsense or conscience, which may not be reliable due to conflict of interest. So, to be *accountable*, or *responsible*? That is the ultimate test of archivists.

As nothing in archivists' professional repertoire gives them the needed justification or guidance to fulfill their historical calling during exceptional trying times, they may fail to act when their roles are particularly important to detect, deter, document the events of atrocities, corruptions or deceits, etc. Such professionalism obviously is inadequate to serve the mission of preserving collective memory as humanity's last line of defense for truth and justice. So, can we design archival curriculums to include the exercises of, say, disobedience and disloyalty, which are justifiable under the assumption of *exceptions*, not the norms, so that archivists' *responsibility* won't make them susceptible to political, social, ethnical or other undue interferences? We think the problems persist even we can do so. Because we will still rely on the archivists' subjective senses to tell if exceptions had occurred and there are undue influences trying to hinder the historical responsibility thus warrant disobedience and disloyalty. As such senses are subjective; archivists may have conflict of interest causing their subjective senses unreliable. Furthermore, those partake in documenting events and publishing records now include possibly untrained, unsophisticated and sometimes unscrupulous individuals or rogue organizations and regimes. They are the new "powerful" in the sense that now they have power to purposefully pollute or muddle up our collective memory rather than safeguarding it if they, say, do not and will not conform to professional or whatever disciplines. Although scholars have generally affirmed the values of unofficial documents and records (Josias 2011; Wallace 2011), there is yet a comprehensive and coherent strategy for archivists to integrate unofficial accounts into collective memory or to maintain their archives' integrity to reflect the collective memory. After all, who can disqualify others, or has authority and legitimacy to decide what shall be included or excluded in the collective memory?

What we need is a fundamental, simple, and very succinct set of principles as the basis of a framework upon which we can have norms and criteria applicable to both normal and exceptional situations to be used by professional and layman archivists alike to guide, hence can justify, their decisions and actions and allow them to reason within themselves and reason with each other; such that they can become reasonable and hence responsible and accountable. Such accountability and responsibility help them trust, communicate, exchange and understand ideas for archival work, to reach agreements to transcend cultural, social or religious differences but summon up their essence and use it to resolve political, ethnical or economic conflicts, to help each other improve each self, to work together to achieve historical cooperation in preserving true and just Memory of the World, which is the collective and accumulated wisdom of mankind that reflects the ultimate truth and the utmost justice. To this end, and since digital curation and digital forensics seem to face similar challenges (Diamond 1994; Duranti 2010; Lee and Tibbo 2011), we propose the same fundamental accountability principles we use to guide

systematic approaches in digital forensics engineering to be applied to sustain this historical-archival paradigm.

4. An Accountability Model

It is much debated among scholars about what *accountability* is exactly and how can we construct and enact accountability (W. W. Liu 2011). Since accountability is such a virtue that has been (mis)characterized as elusive or having a *chameleon* quality (Sinclair 1995), it is often misused to mean something else like blames, liability or punishment, etc. On the other hand, responsibility seems to be well understood and people seem to use the word all the time seemingly without causing any confusion. Nevertheless, as Gardner (Gardner 2003) has pointed out (without using the word), in its core sense responsibility is accountability; both are our *reasoning* capability as human beings. Thus, for us, *being responsible* in this sense is exactly the same as *being accountable*, i.e., we give reasons to respond or justify, or account for our decisions or actions; even in the former case this may be mandatory while in the latter case it's voluntary. But we don't usually use the words this way.

In our common usage of the words, there is a subtle difference between "holding someone responsible" and "holding someone accountable" that the former implies power and control while the latter implies democracy. For example, our superiors in an organization have power and control so they can hold us *responsible*, to lay specific blame, punishment or liability on us if we violated a rule or displeased them. On the other hand, we can only hold our leaders or superiors *accountable* for something they did not do right or didn't do, but they did not violate any law either. So they, not us, still have the power and control. Oftentimes, such subtle differences disappear as we use the words. For example, if our superiors did violate a law then the law, not us, can hold them responsible; but we may say we hold them responsible because we reported it. Or, if so many people blame a leader and hold him accountable then eventually such democratic force may remove him from power. Or, he may resign in order to show people his accountability, which is a required quality of democratic leaders.

From an individual's point of view, *responsibility* seems to be a virtue for subordinates. It is about being responsible to instrumental authorities (superiors), with loyalty, obedience, and efforts to take care of mandates and necessities with professionalism in duties and obligations; whereas *accountability* seems to be a virtue of leaders. It is about being accountable for missions and values, with self-motivation in self-control and self-improvement of leaderships that measure up to commonsense, social norms, altruism, or other higher civil, moral intrinsic orders. But every individual can be both a subordinate and a leader at the same time. Because, as human beings, even some of us are the instrumental authorities, we all are subject to intrinsic authorities like humanity and morality. On the other hand, even the least among us can aspire to have the leadership quality. Responsibility is purpose-driven, objective, more concrete and specific but can be too narrowly delineated, inadequate if become reactive or passive; while accountability is self-motivated, authoritative and encompassing, but can be subjective, vague or elusive sometimes. So, we really need both to complement each other in our historical-archival paradigm.

In our previous work (Liu, Aggarwal and Duan 2009; W. W. Liu 2010), we implemented four accountability principles, namely: *identification*, *authorization*, *attestation* and *retribution*, in a trust management framework for Internet servers to leverage organizations' civil roles to improve accountability in their trust relationships with users, peers and authorities. Those principles also are crucial for servers to bring deterrence and recourse to enforce responsibility so they can trust better, putting reliance on responsible users and peers while holding rogue users or peers responsible. But these

principles are also crucial for servers themselves to account for others and become trustworthy leaders or allies. Thus those principles facilitate accountability in both its *holding to account* and its *giving account* aspects. Now, as the professionalism and ethics manifested in archivists' responsibility have shown inadequacy in the case of South African's apartheid-controlled archives, we believe these accountability principles are useful for our historical-archival paradigm to help archivists make decisions and help them judge or justify their actions in the time of conflict. Specifically, the guidance and justification lie in the principle of authorization, which is based on autonomous *deference*, *reasoning* and *qualification* (W. W. Liu 2011), as shown in Table 1.

Table1: Archival missions, values, and processes defined by accountability.

	Missions	Values	Activities
Authorization	democracy	legitimacy	deference
		protection	reasoning
		access	qualification
Identification	no-deceit	worth	appraisal
		truth	authentication
		knowledge	classification
		reality	verification
Attestation	justice	information	communication
		education	presentation
		evidence, proof	certification
		utility	exhibition
		trust	reputation
Retribution	improvement	deterrence	punishment
		reparation	reconciliation
		correction	rehabilitation
		remedy	liability
		recourse	reprisal

Accountability in a democratic society is marked by deference to the higher, intrinsic, authority and legitimacy (Gardner 2003), unlike responsibility that is marked by deference to instrumental authorities such as rulers or enforcers. Thus, the way accountability works is different from the way responsibility works. The latter is like a command chain running from the top down and stopping at whoever cannot reject the duties or liabilities, whereas the former actually works in a reversed way. Oftentimes, accountability starts from someone *not* at the top who is willing to give account---e.g., a *whistleblower*---and it reaches upward, to get as many higher-ups as possible. So, if archivists use the authorization principle to answer the historical calling and take actions to document the wrongdoing of the powerful,

such decisions and actions are justifiable by the missions and values of the archival institution under the premise of accountability.

From Table 1, authorization primarily serves as a basis for judging archivists' decisions and actions under normal or exceptional circumstances, the other accountability principles are directly related to archival missions, values, and curatorial activities. Identification, for example, is directly related to archival selection and appraisal. Upon acquiring or receiving an object, archivists must actively determine its historical value and classify and categorize it before accepting it into archives. To have a place in the archives, any object not only must be recognized of its historical worth but also need be authenticated and verified before archivists attest to its identity. Once have a place in the archives, objects are maintained and protected in a way to allow safe access by the public. Public's opinions and feedbacks then may be collected and analysed to re-evaluate the objects. Attestation and retribution also apply directly to archival activities such as archival disposition, destruction and removal (Lee and Tibbo 2011).

On further thought, how about the missions and values of archival work? The four accountability principles have intrinsic values to reveal these. Table 1 shows how accountability principles define the missions and values of archival activities. Our assertion is that those accountability principles help to preserve true and just Memory of the World and that in turn will improve the accountability of nations and transnational organizations in World Politics. These four principles not only are effective means as guidance or justifications to help archivists but also can be an end in themselves. Put another way, maybe accountability is the essence of history and archives, preserved in the collective memory to serve the educative purposes of helping mankind shape a better future?

5. Conclusion

As the Internet has stimulated new ideas and new ways of communications to spread and share those ideas across traditional boundaries, it has decreased the efficiency of traditional power mechanisms used by old societies and organizations in accounting or law enforcing and regulatory supervision. On the other hand, the Internet and new technologies improve the awareness of constituencies on their potential inputs and influences on organizations' policies, actions and public relationships (Pruzan 1998); these bring about a wave of changes and new thinking on how to manage complex social systems. The vital, new perspectives emerged in business corporations and governments have shifted organizations' focuses from controls of fiscal and functional responsibilities to autonomy with ethical and managerial accountability. Archival institutions certainly can benefit from such changes too. The four principles of accountability not only are applicable to curatorial activities but also can help archival institutions' governance and public relations. The principles of accountability actually define the missions and values of archival work. We believe every archival institution ought to be an institution for, by, and of accountability. Archivists then can recognize, align with, and be accountable for the missions and values of archival endeavors to obey the intrinsic authority and legitimacy, to uphold social justice with their historical roles independent of temporal political, ethnical or other artificial powers, or instrumental authorities.

Automated Redaction of Private and Personal Data in Collections

Toward Responsible Stewardship of Digital Heritage

Christopher A. Lee¹ and Kam Woods²

School of Information and Library Science, University of North Carolina at Chapel Hill, USA

¹calee@lis.unc.edu, ²kamwoods@email.unc.edu

Abstract

In order to support digital heritage, collecting institutions must serve as trustworthy and responsible stewards of digital information. This requires not only selecting, acquiring and retaining valuable collections, but also providing appropriate access to their contents. Access provision involves data mediation to provide useful access points, to convey contextual information, and to ensure that private information is protected. Identification and redacting of private information is a significant challenge for collecting institutions providing access to born-digital collections. We describe work in the BitCurator project to provide collecting institutions with reliable, automated software and reporting procedures to address the above issues.

Authors

Christopher (Cal) Lee is Associate Professor at the School of Information and Library Science at the University of North Carolina, Chapel Hill. His primary area of research is the long-term curation of digital collections. He is particularly interested in the professionalization of this work and the diffusion of existing tools and methods into professional practice. Lee edited and provided several chapters to *I, Digital: Personal Collections in the Digital Era*. He is Principal Investigator of the BitCurator project, which is developing and disseminating open-source digital forensics tools for use by archivists and librarians.

Kam Woods is Postdoctoral Research Associate at the School of Information and Library Science at the University of North Carolina, Chapel Hill. He is currently the Technical Lead on the BitCurator project. Woods received his Ph.D. in Computer Science from Indiana University, Bloomington and his Bachelors with a special major in Computer Science from Swarthmore College. His research focuses on long-term preservation of born-digital materials; he is interested in interdisciplinary approaches that combine expertise in the areas of archiving, computer science, and digital forensics in enabling and maintaining access to digital objects that are at risk due to obsolescence.

1. Introduction

In order to support digital heritage, collecting institutions must serve as trustworthy and competent stewards of digital information. Responsible stewardship requires not only selecting, acquiring and retaining valuable collections, but also providing appropriate access to contents of collections. Access provision involves various forms of mediation, in order to provide useful access points, convey contextual information, and ensure that sensitive information is not inappropriately disclosed.

Modern computing devices often contain a significant amount of private and sensitive information. The information may appear embedded in document content and document metadata, within system files obscured by operating system arcana, and in traces of content held within local storage systems after interaction with services over a network. It may even inadvertently be retained on disk or in static memory after a device has been retired or formatted without being overwritten.

If collecting institutions do not improve their processes for discovery, identification and redaction of sensitive information, there are three major risks to digital heritage. First, collecting institutions could fail to be perceived as trusted actors who can responsibly care for digital collections. As a result, producers of digital content may be unwilling to transfer their materials to institutions for long-term care. Second, if the costs of processing collections are prohibitively high, then institutions are likely to acquire fewer collections than they would otherwise. Finally, reliance on labor-intensive manual procedures will ultimately result in rapidly growing backlogs of unprocessed material that are stored but not available for use. Lack of use is one of the most serious threats to long-term preservation of digital collections. Many of the tasks associated with identification and redaction of private and sensitive information can be simplified and performed with improved coverage and accuracy through the use of open source digital forensics tools that have been designed to work efficiently with large data streams, scale effectively on multiprocessor and multi-core hardware, support a common metadata schema for information transfer, and emphasize extensibility through the use of developer-friendly plug-in architectures.

2. Private Data in Digital Collections

For the purposes of automated analysis, triage, and redaction, we present the following definition of private data: any data that are personally identifying, could be used to establish the identity of the producer, establish the identity or personal details of individuals known to the producer (e.g., friends, family, and clients) or are associated with a private record (e.g., medical, employment, and education). This definition is specific to features one can extract from digital materials that link them directly to the donor or content producer. A donor could consider to be “private” a collection of documents or media which contain no personally-identifying information, but which he/she would not wish to disseminate publicly. Such collections of digital objects do not fit our working definition of private, but they may be considered *personal* or *personally identifying*.

We can further posit instances of features within born-digital objects that fall within our stated criteria, but do not require protection or redaction. However, when working with large (multi-terabyte or larger) collections of heterogeneous objects, it can be desirable to flag all potential instances of such data and perform filtering and triage after the fact.

2.1 Distinguishing between Private and Non-Private Data

Not all private data requires redaction, and the majority (in terms of bytes) of raw data held on media procured from private donors is likely to be non-private. Donor media obtained as disks or disk images of a modern bootable operating system, for example, will likely contain tens or hundreds of gigabytes of operating system and program executables, shared libraries, and documentation. Furthermore, common locations of private content—user-specific directories, storage volumes, and removable media—are just as likely to contain large collections of non-private content (e.g., PDFs downloaded from the web, commercial music and video content, and installation files).

Private data, under the definition provided above, can be associated directly with an individual. This can include, but is not limited to, social security numbers, credit card numbers, financial records, medical records, employment information, education records, passwords and cryptographic keys, and local and online account records. Private data may also be embedded in data carriers that are not inherently private, such as personal emails and other forms of electronic correspondence.

Collecting institutions deal with large volumes of information that do not meet this strict definition of private, but still requires identification, management, and protection. *Personal* and *personally identifying information* is not inherently private, and includes information that belongs to a specific individual (or group of individuals). Users are typically aware that contact names, telephone numbers, emails, and email addresses are personal and contain personally identifying (and in some cases private) information. Users may be unaware of other types of personally identifying information; for example, EXIF metadata within jpeg image containing geolocation data (GPS tracking information), and logs of user activity stored by an operating system over time.

The operating system on modern computing platforms will often store private and personal data in storage locations alongside non-private data. Depending on configuration and use, a wide variety of structures stored within the filesystem may include data that may be considered personal, personally identifying, and/or private. Logs created by installed applications can include usernames, full legal names, and other personally-identifying data such as addresses, birthdates, and passwords. Usernames and passwords and user account information may be stored in plaintext or using cryptographic techniques that have known attack vectors and readily-available exploits. Reconstruction of network traffic cached by certain applications can yield further vulnerabilities. Log information stored both by the operating system (for example, records of types of external storage devices along with serial numbers and timestamps), by applications (chat and social network logs and cached data), and even as a result of efforts by the user to redact or clear events on the system may also be used to reconstruct traces of personal and private data. Form data and cookies stored by web browsers are a well-known vector for such information. Less well understood (even, in many cases, by technically proficient users) is the fact that personal and private data can be recorded ‘inadvertently’ in hibernation and restore files used by modern operating systems to ensure stateful recovery from suspend events (such as putting hardware to sleep) and system crashes.

Not all traces of interactive use and other activities are private. We would contend that the following will generally contain non-private data:

- Filesystem type and organization (including partitioning info and existence of cryptographically-protected volumes)
- File modification times
- File names (except when those names contain personally identifying information)
- Names and versions of software used to produce digital documents
- Metadata about the hardware, operating system version, and security updates

Accurate identification of non-private data can be a critical aspect of preparing born-digital materials for long-term archival management and access. Specifically, it is often more efficient to cull non-private and non-unique data using known file hash sets (such as those provided in the National Software Reference Library¹) prior to performing deeper analysis on file contents. Identification of this type of data can also assist in building profiles describing and recording the environment in which documents were produced over the lifetime of the filesystem.

2.2 Identifying and Managing Private and Personally Identifying Data

Finding and categorizing private and personally identifying data in raw, heterogeneous data sources can be an arduous, labor-intensive, and error-prone task. As an example, string and regular expression

¹ <http://www.nsrll.nist.gov/new.html>

searches² are limited by prior knowledge of what is being sought, fail in the presence of extended character sets, and are often implemented in programs that do not attempt to parse known binary formats, compressed files or filesystems, or file metadata. Procedures that parse only the currently allocated areas of a filesystem may fail to find private and personal data that remains in ‘deleted’ (de-allocated but not overwritten) files, damaged areas of the filesystem, and ‘slack space’—data existing in blocks associated with allocated files that have not been completely overwritten (Garfinkel, 2010). Many tools that provide interactive low-level access to raw devices or disk images depend on extensive post-processing to generate useful reports on what is being observed, or depend on significant expertise and training on the part of the user.

Addressing the requirements of accurately identifying specific features in diverse filesystems and data formats can result in a patchwork of procedures and software mechanisms accumulated over years of effort and experimentation. This patchwork must then itself be curated, along with its associated training documentation and administrative overhead. This is a fundamental barrier to sustainability; knowledge of the system can become increasingly fragmented as training costs and complexity increase. These approaches also scale poorly with increased data volume, as each tool must typically be run independently over the objects in question.

These issues are not unique to collecting institutions, and have many parallels to issues encountered by digital forensics investigators. Garfinkel (Lessons Learned 2012) summarizes findings by Hibshi et al. (2011) that describe fundamental issues that law enforcement professionals have when dealing with raw, heterogeneous data collections:

They are general deadline-driven and overworked. Examiners that have substantial knowledge in one area ... will routinely encounter problems requiring knowledge of other areas ... for which they have no training. Certifications and masters’ degrees are helpful, but cannot fundamentally address the diversity problem as any examiner might reasonably be expected to analyze any information that their organization might possibly encounter on digital media (S82, emphasis added).

One of the underlying problems—that of working with heterogeneous forms of data from many sources—can be mitigated through the use of high performance, multipurpose software tools that consolidate functionality. Ideally, these tools should provide mechanisms for reporting on data in ways that are neutral with respect to a use case or workflow, allowing institutions to customize the technology for unique aspects of their respective institutional environment.

3. Applying Digital Forensics to Digital Collections

More than a decade ago, a report by Seamus Ross and Ann Gow (1999) discussed the potential relevance of advances in data recovery and digital forensics to collecting institutions. More recently, there has been an active stream of literature related to the use of forensic tools and methods for acquiring and managing digital collections. This has included activities at the British Library (John 2008), National Library of Australia (Elford et al. 2008), and Indiana University (Woods and Brown 2008; Woods and Brown 2009).

²String searches look for specific runs of characters within the data. Regular expressions are a more complicated way to identify particular patterns, allowing one to find, for example, given combinations of characters even if they appear in different sequences or are separated by other characters.

The PERPOS project at Georgia Tech has also applied data capture and extraction to US presidential materials (Underwood and Laib 2007; Underwood et al. 2009). A project called “Computer Forensics and Born-Digital Content in Cultural Heritage Collections” hosted a symposium and generated a report (Kirschenbaum, Ovenden and Redwine 2010), which provided significant contributions to this discussion. The Born Digital Collections: An Inter-Institutional Model for Stewardship (AIMS) project developed a framework for the stewardship of born-digital materials that includes the incorporation of digital forensics methods (AIMS Working Group 2012). The Digital Records Forensics project has also articulated a variety of connections between the concepts of digital forensics and archival science (Duranti 2009; Duranti and Endicott-Popovsky 2010; Xie 2011).

3.1 Acquiring Content from Born-Digital Media

When information is obtained from an individual or organization on fixed or removable digital media (such as hard disks, CD-ROMs, and USB drives), the collecting institution often does not know the state of the—whether they are physically damaged, whether the filesystems were left in consistent states by the producer or program which last interacted with them, or whether there are traces of previous (unrelated to the acquisition) filesystem activity remaining on the device.

Simply mounting a device on an appropriately equipped workstation and examining the contents of the filesystem in a desktop environment can pose significant risks to the consistency and authenticity of writeable filesystems (even when the device itself is mounted read-only). Likewise, many modern operating systems will ignore multiple disk volumes (mounting only the first volume), or fail to mount filesystems that are common on other modern platforms (or were common on a legacy platform).

In order to ensure that data from an acquired device remain unchanged (but can still be analysed thoroughly in their original state), the media can be *forensically imaged*. A bit-identical copy of the data on the media (known as a disk image) can be extracted using *write-blocking hardware*, which is connected as a physical proxy between the media-reading device and the host system and prevents the host system from changing any data on the original media. Typically, this disk image will be packaged with supporting metadata that describes the time, date, and other relevant information about the imaging process, using forensic imaging software that can write to an open imaging format such as the Advanced Forensic Format (AFF) (Garfinkel 2006, 2009), or well-documented commercial formats such as Guidance Software’s EnCase Forensic Image. Examples of such software include the open source tool Guymager and the commercial tool Access Data’s FTK Imager.

Bit-identical images of source media are useful for many reasons other than identifying and redacting private data. A donor may have forgotten where certain materials are on disk, whether they are password-protected or encrypted, or may have accidentally deleted important records. Access to the complete disk image provides a greater chance of recovery in such situations. Programs and documents located on the original disk may depend on fixed paths. The original filesystem may have damage that can be identified and repaired with access to logs and other system recovery data. Once a disk image has been created, one can automatically extract both general information about the filesystem, and instances of features corresponding to the types of private data outlined earlier.

Digital forensics workflows usually incorporate disk image packing formats, which include not only the raw data from a disk (including all original filesystem metadata from the disk) but also rich metadata about the capture process. Consider the following selected sample of metadata encapsulated in an AFF disk image extracted from a circa-1999 4.2GB external USB hard disk:

Table 1. Metadata Associated with a Disk Image as Part of an AFF Package

Segment	Data Length	Data
description	48	Quantum Fireball 4.2GB External
notes	16	000ECC21000831B9
badsectors	8	0 (64-bit value)
md5	16	C553 4AEA 0440 C75E 1B0A 508D...
sha256	32	954B A2B8 30F9 19C5 81F9 F546...
acquisition_seconds	0	= 00:09:46 (hh:mm:ss)

The complete AFF metadata provides a significantly more nuanced view of the capture process, but the information in Table 1 alone provides valuable reference points for future analysis; capture time, multiple cryptographic checksums for the raw image, the serial number of the original hardware (when available), and the number of bad sectors encountered.³

Both the filesystem metadata within the disk image and the supplementary metadata within the disk image package can be used to document provenance⁴ and chain of custody.⁵ Forensic formats typically “chunk” data, associating cryptographic checksums with each chunk. When compression is used, it is generally at the chunk level rather than at the level of the file; because of this, if partial data loss occurs (due to physical or logical failure on the storage medium), the undamaged parts of the disk image can be recovered with relative ease.

Note that analysis of disk images does not depend on the use of a custom forensic format; the majority of modern forensics tools will operate just as effectively on raw bitstreams (and even raw devices, should the need arise). In the following section, we discuss software tools and approaches being integrated into BitCurator.

3.2 BitCurator

The BitCurator project is a joint effort—led by the School of Information and Library Science at the University of North Carolina, Chapel Hill (SILS) and Maryland Institute for Technology in the Humanities (MITH), and involving contributors from several other institutions—to develop a system for librarians and archivists that incorporates the functionality of many digital forensics tools (Lee et al. 2012).

Digital forensics offers methods that can advance the archival goals of maintaining authenticity, describing born-digital records and providing responsible access (Woods and Lee 2012). However, most

³ Note that “Data Length” refers to the structure of the output item, not the relevant data value – in this case, no bad sectors were found.

⁴ Provenance “consists of the social and technical processes of the records’ inscription, transmission, contextualization, and interpretation which account for its existence, characteristics, and continuing history” (Nesmith 1999, 146).

⁵ Chain of custody is the “succession of offices or persons who have held materials from the moment they were created” (Pearce-Moses, 2005, 67). It can be ensured through control, documentation, and accounting for the properties of a digital object and changes of state (e.g., movement from one storage environment to another, transformation from one file format to another) throughout its existence—from the point of creation to each instance of use and (when appropriate) destruction.

digital forensics tools were not designed with archival objectives in mind. The BitCurator project is attempting to bridge this gap through engagement with digital forensics, library and archives professionals, as well as dissemination of tools and documentation that are appropriate to the needs of memory institutions. Much BitCurator activity is translation and adaptation work, based on the belief that professionals in collecting institutions will benefit from tools that are presented in ways that use familiar language and platforms.

BitCurator—and the efforts of many of the project partners—also aim to address two fundamental needs of collecting institutions that are not priorities for digital forensics industry software developers:

1. Incorporation into the workflows of archives and libraries, e.g., supporting metadata conventions, connections to existing content management system (CMS) environments. This includes exporting forensic data in ways that can then be imported into descriptive systems, as well as modifying forensics triage techniques to better meet the needs of collecting institutions.
2. Provision of public access to the data. The typical digital forensics scenario is a criminal investigation in which the public never gets access to the evidence that was seized. By contrast, collecting institutions that are creating disk images face issues of how to provide access to the data. This includes not only access interface issues, but also how to redact or restrict access to components of the image, based on confidentiality, intellectual property or other sensitivities.

Two groups of external partners are contributing to BitCurator: a Professional Expert Panel (PEP) of individuals who are at various stages of implementing digital forensics tools and methods in their collecting institution contexts, and a Development Advisory Group (DAG) of individuals who have significant experience with development of software. The core project team met with the PEP in December of 2011 and the DAG in January of 2012 to discuss the design assumptions and goals of the project. We have also received comments and suggestions from individuals in a variety of organizational settings. These various forms of input have helped us to refine the project's requirements and clarify the goals and expectations of working professionals.

The project is packaging, adapting and disseminating a variety of open-source applications. BitCurator is able to benefit from numerous existing open-source tools.⁶ The goal is to provide a set of tools that can be used together to perform curatorial tasks but can also be used in combination with many other existing and emerging applications.

In the following sections we briefly discuss risk-reducing practices for acquisition of content from born-digital media, and examine in detail how modern digital forensics tools can be used to ensure that private and personally-identifying data is quickly and accurately identified and reported.

4. Applying Digital Forensics to Identify and Redact Private and Personally Identifying Data in Born-Digital Collections

A primary goal of BitCurator is to enable professionals at collecting institutions to rapidly and accurately identify private and personally identifying data. We facilitate this by using a toolset that is intended to be

⁶In addition to those discussed in the following text, BitCurator is also incorporating Guymager, a program for capturing disk images, and Nautilus scripts to automate the actions of command-line forensics utilities through the Ubuntu desktop browser.

simple to operate, constructs well-formatted human- and machine-readable reports on those data, and interoperates effectively with existing archival data management systems.

The operational aspects of research efforts conducted as part of BitCurator depend on a set of mature open source software technologies originally developed for digital forensics and law enforcement investigations. The technologies we depend on include bulk extractor and fiwalk (developed by Simson Garfinkel), The Sleuth Kit (developed by Brian Carrier and Basis Technology), and sdhash (developed by Vassil Roussev). These projects, their functions, and our adaptations are described in the following sections.

4.1 Filesystem Analysis

While it can be useful to mount and explore a filesystem interactively on a host machine, it is often undesirable to rely solely on information gained this way. First, this is a risky activity if a hardware write-blocker is not used. Second, this will not yield information on deleted contents, unallocated space, and (often, without specialized software) secondary or alternate filesystems contained on the device. Finally, this form of investigation is time-consuming and prone to human error.

To report on the contents of the filesystem, we use fiwalk, a program originally developed by Simson Garfinkel and now integrated into The Sleuth Kit. Fiwalk processes disk images using the filesystem processing libraries in The Sleuth Kit, and generates results either in Digital Forensics XML (DFXML)⁷ or as human-readable plaintext. A typical run of fiwalk will produce some technical metadata on the operation of the program and the host environment, along with a complete walk of the file hierarchy—including volume information, directories, regular files (including lengths and block offsets within the disk images), and files which are no longer allocated (deleted).⁸ Additional uses and examples can be found at <http://afflib.org/software/fiwalk>.

As an example, consider the following sample of XML output of fiwalk being run against the legacy 4.2GB external USB drive referenced in Section 3.1 (a disk that includes real-world data and is part of the BitCurator Disk Image Test Corpus discussed in Section 4.6). This sample includes a single “fileobject” entry for a file that is orphaned—that is, a file that originally supported the operation of an installed program and is no longer used or referenced by that program. Such files are typically not visible to users interacting with a filesystem (Figure 1).

Note that this file is almost 50KB in size. In section 4.3, we provide a further example of how information extracted by forensic data analytics tools can be used to link private and personally identifying information to specific data objects (and specific byte offsets within those objects), particularly when they are “hidden” in this manner.

Using an existing Python module and supporting code distributed with fiwalk, the BitCurator project is preparing programs that can be run against collections of disk images to generate human-readable reports on information useful for triage and data sanitization tasks: for example, the number and type of filesystems recognized, and distribution and location of file types.

⁷ For a discussion of DFXML, see our section on Data Reporting.

⁸ Fiwalk currently recognizes those disk formats which are supported by The Sleuth Kit, including FAT16 and FAT 32, NTFS, HFS+, ext2/3/4, and ISO9660.

4.2 Bulk Data Analysis and Stream-Based Forensics

In order to identify instances of potentially private and personally identifying data, we use bulk extractor, a bulk data analysis tool also developed by Garfinkel. While there are many existing tools that can be used to parse filesystem structures and individual file formats, bulk extractor ignores file system structure and instead processes information from a disk image as a sequence of 16MiByte pages. As a practical consequence, bulk extractor can process different sections of a disk in parallel, greatly increasing performance on modern multicore hardware. Furthermore, bulk extractor can identify, decompress, and recursively reprocess compressed data (for example, modern zipped, XML-based document formats such as Office Open XML).

Bulk extractor is capable of identifying numerous data features using a collection of software modules designed to target feature types, particularly those likely to include private and personally identifying information. These include:

- Private accounts information (credit-card numbers)
- Unique private identifiers (social security numbers)
- Hexadecimal- and Base64-encoded text
- Internet domain names
- Email addresses, email messages and headers
- Ethernet MAC addresses
- EXIF metadata from JPEG images
- Telephone numbers
- URLs and search histories
- Compressed files (zip and gzip files, which BE can proactively decompress and analyse)

- Windows hibernation file fragments
- User-defined keywords

A more detailed listing can be found at https://github.com/simsong/bulk_extractor/wiki, and within the technical documentation distributed with the bulk extractor source code. A typical run of bulk extractor will produce a directory containing text files for each feature type, populated with feature instances and associated offsets into the related disk image. Histogram data for feature instances (e.g., how many times a given email address appeared on a given medium) is generated in separate files.

4.3 Data Triage

Using the filesystem information provided by fiwalk, and the feature data produced by bulk extractor, one can perform a wide variety of triage and reporting tasks working directly from an unmounted disk image. Bulk extractor includes a Python script which maps each feature instance back to a specific location on disk, allowing one to build a list of which feature instances (specifically potentially private and personally-identifying data) correspond to allocated files and which are located in deleted files or currently unallocated space.

Continuing our previous example using data from a legacy 4.3GB external USB hard disk, Table 2 illustrates that features identified by bulk extractor (in this case, URLs visited and searches performed by the user) can often be linked to extant file objects on disk even when primary application caches have been cleared.

Table 2. Example of Feature Data from Bulk Extractor

Position	16844161
Feature	http://www.yahoo.com
Context	[REDACTED@ http://www.yahoo.com \x00\xAD\x0B\...[REDACTED]
File Name	\$OrphanFiles/INDEX.DAT
File MD5	39c52b472ec890cc29f71419d6aba999

This example has been selected (and partially redacted) because it is innocuous, and cannot be linked to a specific user. However, even on this relatively small disk (notably, a disk that was never used as a primary boot medium) hundreds of examples of personally identifying and potentially sensitive feature instances were found in the linked output.

One can further identify areas where user activity and user-created data are most prevalent, by isolating collections of relevant features. For example, on a modern Windows 7 operating system this would likely include the user's home folder, the user's registry hive (NTUSER.DAT), common or shared document and media directories, hibernation files produced by the operating system, and the Recycle Bin. Bulk extractor proactively decompresses and reprocesses several common compressed formats, further reducing the need for manual intervention.

An additional method for performing data triage is fuzzy hashing. Comparing standard cryptographic hashes for two files simply indicates whether the two files are exactly the same (are the same bitstreams). Fuzzy hashes, on the other hand, can indicate whether two files are approximately

similar. This can help with the managing of private or personal data in at least two ways. First, if a user identifies an item (File A) that is relevant to his/her search goals, but File A contains private data (and thus cannot be viewed by him/her), then a repository could provide a different item (File B) that is quite similar to file A but does not contain the private data in question. Conversely, if a repository contains a set of files that are known to contain private data (based on use of a tools such as bulk extractor), then fuzzy hashing could be used to identify other similar files that might benefit from further human review to determine if they might also contain other forms of private data that were not identified in the initial investigation. BitCurator is incorporating a fuzzy hashing tool called sdhash (Roussev 2011).

4.4 Data Reporting

Using the output of fiwalk, bulk extractor, and additional open source digital forensics tools, BitCurator facilitates the creation of machine-readable and human-readable reports. These reports can be constructed in a modular fashion by reading and reprocessing Digital Forensics XML (DFXML)⁹ output and other tool-produced metadata (Garfinkel, Digital Forensics, 2012). DFXML is an evolving schema designed to simplify and standardize the interoperability of tools that produce digital forensics output. Designed to be simple to generate and reprocess, DFXML can be used to describe filesystems and the objects they contain (including low-level information such as permissions, timestamps, location on disk, and cryptographic hashes). Disk image metadata generated using DFXML-producing tools can readily be annotated with Dublin Core tags.

BitCurator will generate reports from disk image contents and DFXML output as PDFs, slide-show presentations, and machine-readable metadata. These can fill a variety of roles: highlighting distribution of data on disk (as simple charts or treemaps); listing areas likely to contain substantial amounts of private data; generating timelines of email activity; identifying use of external devices; and building a difference map between a source disk and a copy.

More sophisticated reports can be produced depending on the options one specifies for (and information one provides to) the bulk data processing tools. For example, bulk extractor supports both *stop lists* and *context-sensitive stop lists* and can be directed to suppress reporting on particular feature instances always or within certain contexts. This can be useful for organizations that are working with large volumes of material and it is known ahead of time that certain data that might appear private is, in fact, not private.

As an example, any set of feature instances that is output by the bulk extractor tool (such as a list of email addresses from a particular domain) is initially flagged with the byte offset in the disk image where it appears. Assuming the filesystem(s) on the disk have been recognized, one can run a secondary utility distributed with bulk extractor (`identify_filenames.py`) to link each feature instance either to a file currently allocated within the filesystem, a deleted file, slack within the filesystem, or an unallocated area of the disk. Subsequently, one can organize this output in a way that clearly shows the user where items of concern may appear.

⁹http://www.forensicswiki.org/wiki/Category:Digital_Forensics_XML

4.5 Redaction, Whitelisting, and Access

A significant issue with many modern digital collections is that while they may contain mostly non-private data, lack of appropriate private-data protection and distribution models often means that they remain “dark,” effectively inaccessible.

Redacted disk images can be produced by using the mapping between private data feature instances and disk blocks within the forensically-packaged disk image. Overwriting the relevant parts of the bitstream with randomized or zeroed-out data on a copy of the forensically-packaged image produces a disk image that no longer contains the private data. The redacted image can then be used in various ways—as a backing store for a web front end that provides access to contents of the filesystem, or as a complete distributable object.

Alternatively, whitelisting can be used to produce a “permissions overlay” for the original image, which may be hosted in a sandboxed virtual environment where the user (either at a local workstation or via a remote terminal) interacts with the live environment but is disallowed access to certain files or subtrees within the filesystem. This approach is particularly appropriate when the acquired medium includes a bootable operating system.

If the goal is to generate a collection known to have been produced by a single person or organization, and a donor has confirmed that all identities and data within that collection are to be made public, only a redaction profile for private data from other sources may be required. In every case, however, all private data should be clearly and systematically identified.

4.6 The BitCurator Disk Image Test Corpus

A major challenge to improving the consistency and coverage of private data handling across collecting institutions is the lack of shared corpora on which to test software designed to identify such data. It is unlikely that such a corpus could be created from existing collections materials (or unprocessed materials within backlogs) due to existing donor agreements, legal guidelines, and institutional mandates. Although it is possible to construct large corpora of data from private materials inadvertently or maliciously released onto the Web, this can be ethically problematic to further disseminate and such corpora also will not generally include the complex data structures and interrelationships found on media originally belonging to individual users and corporate entities.

Simson Garfinkel has addressed this problem in the forensics community by constructing the Real Data Corpus (RDC), approximately 30TB of data corresponding to disk images extracted from media and devices purchased on the secondary market. Researchers can obtain access to the RDC with institutional review board (IRB) approval.¹⁰ While the RDC is an extremely useful research and forensic tool development resource, it contains materials from many sources which collecting institutions would identify as having little or no archival value (for example, hard disk drives from retired ATM machines).

The National Institute of Standards and Technology has prepared a publicly available corpus, entitled the Computer Forensic Reference Data Set (CFreDS). At the time of writing, this set of disk images and exercises is largely geared towards law enforcement, and includes detailed but relatively anodyne synthesized exercises geared towards basic training and tool testing.

¹⁰ <http://digitalcorpora.org/corpora/disk-images/real-data-corpus>

For the BitCurator project, we have been constructing a test corpus in order to replicate common data analysis and triage workflow steps in digital archives. This consists of a non-public corpus of disk images extracted from fixed and removable media identified as containing data likely to have archival value (or requiring long-term preservation) by researchers and practitioners from the project's two advisory groups. In the first year of the project, we requested data from the ten project advisors on our Professional Experts Panel, and nine on our Development Advisory Group. We received data in the form of raw and forensically packaged disk images from the City of Vancouver Archives, the National Institute of Standards and Technology, Duke University, and the National Library of Australia. The transfer is based on a data transfer agreement in which the project team agrees to use the data only for purposes of research and testing within the context of the project.

We have subsequently added to this corpus approximately ten years of disk images from retired workstations and legacy external media provided by iBiblio at the University of North Carolina at Chapel Hill. Additionally, we have included approximately 100,000 government documents in common office file formats crawled from the Web for the purposes of sampling document metadata and content. The corpus currently includes approximately 7.5TB of data, with coverage of major disk formats including FAT16 and FAT32, NTFS, HFS and HFS+, ext3/4, and various double- and high-density floppy images.

In an upcoming phase of the project we will be using this corpus as a testbed for our triage, reporting, and redaction tools. This will allow us to provide statistics on consistency and coverage of our procedures, and isolate problem cases corresponding to damaged or unrecognized filesystems, rare data encodings, and any inconsistencies identified in tool output.

5. Discussion and Future Work

The ability to rapidly and accurately identify the location and nature of private data on a device has many potential applications in libraries and archives. These include:

- 1. Formal accounting of best practices—focusing on technical challenges in identifying and handling private and sensitive data in new and existing collections.**

Collecting institutions have written mandates, formal procedures, and legal guidelines in place for handling private data, but these guidelines can result in both conceptual and technical pitfalls in implementation.

- 2. Integration of existing digital forensics tools into workflows of collecting institutions.**

Tools such as bulk extractor and The Sleuth Kit provide high-quality coverage of a wide range of private information in many common disk formats, and can be extended to address the needs of those outside police investigation contexts. Ongoing and future work in this area will address the following:

- Providing cumulative statistics on what has been identified in both existing collections and raw donor materials.
- Establishing more complete chains-of-custody and technical provenance metadata in order to support records of authenticity with increased coverage and accuracy.
- Integration of existing digital forensics metadata currently used for tool interoperability (including but not limited to Digital Forensics XML) into extensible metadata schemas and standards supported by the wider community and maintained by a recognized authority.

3. Preparing customized collections for specific audiences.

Many institutions wish to provide alternate “views” of raw (unredacted) data sources based on credentials, location, and other forms of authentication. Redaction profiles that limit access to specific areas of a bitstream (or provide a complete copy of the bitstream with sensitive areas overwritten with junk data) are a natural solution to this. Providing simple links between such profiles and authentication mechanisms already in use could provide a powerful mechanism for improved public access to large backlogs of digital materials.

6. Conclusion

We have discussed basic approaches and tools for addressing private and non-private data on digital media. As part of this analysis, we have identified specific circumstances under which they can be identified and (or) redacted. We have examined some current digital forensics technologies that handle this problem efficiently with a low incidence of unwanted results. We have discussed how existing open source digital forensics tools and platforms, including The Sleuth Kit, bulk extractor, and fiwalk can be incorporated into an efficient, automated workflow in order to produce machine- and human-readable reports and metadata. We have addressed these points in the context of BitCurator, an ongoing research initiative at UNC Chapel Hill and the Maryland Institute of Technology and the Humanities to build, test, and analyse software and systems for incorporating digital forensics methods and technologies into the workflows of collecting institutions.

As stated earlier, it is important for collecting institutions to address issues of private and sensitive data for a variety of reasons: in order to serve as trusted actors who can responsibly care for digital collections, to keep the costs of processing collections from being prohibitively high, and to avoid growing backlogs of unprocessed material that are stored but not available for use. Perpetuating humanity’s heritage will increasingly involve the curation of digital traces generated by individuals (Lee 2011). Caring for and perpetuating this heritage will require responsible curation of content, attending to access restrictions and protection of individuals. Such work will require a great deal of creativity and judgment, supported by efficient and reliable tools.

Shared Perspectives, Common Challenges

A History of Digital Forensics & Ancestral Computing for Digital Heritage

Corinne Rogers¹ and Jeremy Leighton John²

¹*School of Library, Archival and Information Studies, The University of British Columbia, Canada, cmrogers@mail.ubc.ca;* ²*Department of Digital Scholarship, The British Library, United Kingdom*

Abstract

Although the field of computer forensics might appear distinct from the curation and preservation of cultural objects, these disciplines have overlapping histories and legacies deriving from shared challenges and theoretical perspectives. A convergence of practice of the digital forensic investigator and the digital archivist is gaining momentum as collecting institutions are faced with growing accessions of digital media. Shared theoretical perspectives include issues relating to authorship and identity, informational pattern and change over time, evidential reliability, and digital materiality. Shared challenges include the volume of a person's life information spread across myriad devices, the complexity of diverse applications and locations, the necessary versatility of tools and techniques required to capture, investigate, and describe digital information, planning to ensure sustainability and long-term preservation, and issues of security, privacy and other digital rights. This paper offers a historical overview of digital forensics mapped to current issues in digital curation and preservation in cultural heritage domains.

Authors

Corinne Rogers comes from a senior administrative background in non-profit organizations with an interest in policy and governance. Currently a doctoral student at UBC's School of Library, Archives and Information Studies, her research interests focus on legal and ethical issues associated with digital materials offered as evidence at trial. She is a research assistant under the direction of Dr. Luciana Duranti in InterPARES and the recently completed Digital Records Forensics Project. Corinne is also a researcher with the Veterans Transition Program at UBC where she is establishing an oral history project.

Dr Jeremy Leighton John has been Curator of eMANUSCRIPTS at the British Library since 2003, previously having been Specialist Scientific Curator. In 1996 he completed a Ph.D in Zoology at Merton College, University of Oxford. He is a Fellow of the Linnean Society of London and of the Royal Geographical Society. As Principal Investigator of the Digital Lives Research Project funded by the UK Arts & Humanities Research Council, he promoted archival digital forensics. Currently, a member of the Committee of the Section for Archives and Technology within the Archives and Records Association of UK & Ireland; previously, a member of the Library Committee of the Royal Society.

1. Introduction

The field of forensics and investigation might at first glance seem quite separate from the curation and preservation of cultural objects; yet these disciplines have overlapping histories and legacies deriving from similar goals, common challenges, and shared theoretical perspectives. A convergence of perspectives and methods of the digital forensic investigator and the digital archivist is gaining momentum as collecting institutions are faced with growing accessions of digital media and objects (John 2008; Kirschenbaum, Ovenden, and Redwine 2010). The conceptual underpinnings of digital (or

¹ The authors made similarly substantial contributions to the paper.

computer) forensics² can be interpreted through the lens of information and archival science, to illuminate parallels between these disciplines and reveal avenues of further research to their mutual benefit. This paper outlines points of convergence between these disciplines, offers a historical overview of digital forensics, and discusses its relevance to ancestral computing and issues of digital curation and preservation in cultural heritage domains. The role of an archivist may be as a record keeper, caring for the documentary legacy of an organization, or as a curator of a personal archive of a writer, scientist or political figure. Both functions are embraced by this paper.

2. Similar Goals

2.1 Archival Function

At the most basic level, both digital archivists and digital forensics practitioners are concerned with discovering, understanding, describing and presenting information inscribed on digital media.

The core archival functions “upon which archivists build their scientific, professional and educational profiles” (Duranti and Michetti 2012) can be identified as appraisal and acquisition, arrangement and description, retention and preservation, management and administration, and reference and access. Furthermore, research may be considered the foundation of each archival activity, “a professional function if not the core of all functions” (Duranti and Michetti 2012).

Archival research has focused historically on records, defined as documents created or received in the course of practical activity, and set aside for further action or reference (Duranti and Thibodeau 2006), as the primary objects of investigation. Records serve as evidence of actions and transactions, and lose much of their meaning in isolation or removed from their juridical or institutional context. In their analysis, the archivist strives to determine the purpose and functions of their creator, and the means and methods of their documentation. The informational content of records may in some cases be less important to this analysis than the circumstances of their creation and use. Personal archives may be investigated for their content as when a series of drafts leading to a final published novel is critically examined for evidence of literary creativity. Archivists are thus concerned with establishing the evidentiary capacity of documents, and analysing their evidential value, whether they are preserved primarily as records (as with a public organisation) or for their informational value as personal memory or legacy (as with a personal archive). According to Menne-Haritz, “Evidence means patterns of processes, aims and mandates, procedures and results, as they can be examined. It consists of signs, of signals, not primarily of words. ... All those are nonverbal signs that must be interpreted in context to disclose their meaning. To one who understands them, they will tell how processes worked and who was responsible for which decision” (Menne-Haritz 1994).

Although archival theory originated in legal and administrative doctrine reaching back many centuries to Roman times, modern archival scholarship has its roots in the 17th and 18th centuries, when it became closely aligned with historical scholarship, adopting and adapting methods of historical research and the philological disciplines to archival research into documents in the prevailing world of print.

² Early practitioners referred to the practice of computer forensics. As digital devices become ubiquitous and diverse, the term “digital” has begun to replace “computer” (see for example Whitcomb 2002) However, there is little consistency even today. While the tendency may be to preference “digital”, the term computer forensics is still in use, and is particularly appropriate in the context of ancestral computing and legacy hardware and software.

Today we live in a digital world. Computer technology has changed the way we communicate, conduct business, present our public face(s), and document our private lives. As digital communications supplant print-based culture, a new literacy is evolving. Digital culture is challenging the viability and legitimacy of many well-established social and cultural norms and their associated legal frameworks (Doueihi 2011). One aspect of this evolution can be observed in our concepts of trust in digital information and our reconception of what it means for a digital object to serve as documentary evidence, which relies on our ability to assess its authenticity and integrity. We are tempted to consider the records, documents, and information that we create and disseminate over the Internet as being equivalent to similar forms in our traditional, analogue world. Because of an assumption of functional equivalence of digital and analogue documents and data, the authenticity and trustworthiness of these new digital creations are often judged by the same standards. However, “Virtual authenticity is not to be explained by a transfer of a well-known and ultimately problematic category from one model to another; it is not to be restricted to a shift from the real to the virtual” (Doueihi 2011). Archivists are embracing the new digital literacy, re-examining traditional concepts of retained information—records, documents, data—and the attributes by which we have traditionally assessed evidentiary capacity and evidential value. Archival methodologies, developed originally over centuries in a print-based culture, are being adapted to address digital material, and are embracing new disciplinary knowledge in order to do so.

2.2 Digital Forensic Function

The new discipline of digital forensics was developed originally for the purposes of law enforcement in order to investigate computer crime and bring digital evidence to trial. It applies scientific principles and methodologies in reconstructing past events and artefacts, and has developed technologically in intimate association with the advancement of forensic tools. It is defined as:

The use of scientifically derived and proven methods toward the preservation, collection, validation, identification, analysis, interpretation, documentation, and presentation of digital evidence; derived from digital sources for the purpose of facilitation or furthering the reconstruction of events found to be criminal, or helping to anticipate unauthorized actions shown to be disruptive to planned operations (Palmer 2001).

Throughout its history there have been calls for digital forensics to be situated within a broader social and theoretical framework (Palmer 2001). Drawing on computer science theory and forensics theory from physical forensics disciplines, digital forensics practitioners and researchers are actively developing process models that can be used to help standardize digital forensics investigations and form the basis of new theory. These process models identify core digital forensics activities, and from these, we can draw close parallels with archival functions. Beebe and Clark (2005) have proposed one such model, and mapped their framework to similar, previous frameworks commonly cited in the literature.³ The core functions of the Beebe and Clark model are preparation and incident response, data collection, data analysis, presentation of findings, and incident closure. The first three may be compared with archival functions of appraisal and acquisition, while data analysis parallels arrangement and description, and

³ The models compared by (Beebe and Clark 2005) are: the DFRWS model (Palmer 2001; US Department of Justice 2001; Reith, Carr, and Gunsch 2002; Carrier and Spafford 2003; Mandia et al. 2003; Nelson et al. 2004, O’Ciardua in 2004; Casey and Palmer 2004).

elements of presentation of findings (also evident in arrangement and description) may be seen in reference and access, and elements of incident closure may be compared with archival retention and preservation.

2.3 Convergent Utility of Evidence

Digital forensics thus offers digital archivists another way of conceptualizing digital objects and assessing their integrity and authenticity that can complement and be complemented by existing archival methodologies (Duranti and Endicott-Popovsky 2010; Duranti and Rogers 2011). Digital forensic tools and techniques are also being applied in service of information security, including incident investigation and forensic readiness, or incident prevention (Endicott-Popovsky, Frincke, and Taylor 2007; Endicott-Popovsky and Frincke 2007; Taylor, Endicott-Popovsky, and Frincke 2007). They are increasingly being tested in trusted digital repositories to assist archival processes of acquisition, selection, appraisal, description, and preservation of cultural and scientific heritage materials (John 2008; Kirschenbaum 2008; Kirschenbaum, Ovenden, and Redwine 2010).

There is an increasing desire in both the archival and the digital forensics communities to look to knowledge in complementary disciplines to investigate the challenges to theory and practice presented by digital technologies. Social and natural sciences, humanities, law and digital forensic discipline, and the information disciplines are all evidence-based disciplines, and so have a stake in the trustworthiness of digital material and its preservation, and each brings unique theoretical perspectives to bear.

3. Common Challenges

3.1 Digital Diversity, Volume & Complexity

Some of the biggest challenges faced by digital forensic scientists and practitioners are the diversity of digital media, the sheer volume of digital material, and the complexity of the problems of capture and analysis. This similarly confronts those who are responsible for digital archives and cultural heritage repositories, for these may contain representatives of digital objects and media that come from almost anywhere. At the same time the size of the digital universe,⁴ and the rate of technological change are far outpacing the capacity of archivists and forensic examiners to keep up.

3.2 Versatility of Tools & Techniques for Digital Forensic Analysis and Curation

“Just as it has been said that ‘one software tool does not a computer examiner make,’ only possessing one investigative process model is equally as limiting. Computer forensics examiners need a repertoire of tools and just as important a repertoire of examination and investigative approaches” (Rogers et al. 2006).

To address the profusion of digital objects and media in countless situations it is necessary to have a variety of tools and not to rely on any single technology or methodology. Equally the workflows and procedures need to be receptive to change, to be designed for flexibility and adaptability so that new functions can be quickly embraced and integrated.

⁴ <http://www.emc.com/leadership/programs/digital-universe.htm>.

This novelty, diversity and complexity of tools and digital objects in turn calls for a careful and extensive marshalling of metadata and documentation. This is a requirement that may draw on the rapidly increasing experience and expertise of the digital archive and data curation communities.

Historically, much of the analysis software used by digital forensics practitioners has been proprietary and commercial or custom-built for local use. Increasingly, open source solutions are being sought and developed. This benefits forensics analysts, supports admissibility requirements of digital evidence at trial, and enhances capacity for archival processing and long-term preservation in digital repositories (Altheide and Carvey 2011).

3.3 Long Term & Lifecycle Considerations for Digital Preservation

The long-term sustainability of digital objects and the information that these bear, and their continuing accessibility and usability over time has been a primary driver, a *raison d'être*, for the digital preservation community. It is increasingly a concern for the digital forensic community too, which has made some important steps including the development of the Advanced Forensic Format, a new open source format for storing disk images (Cohen, Garfinkel, and Schatz 2009; Garfinkel 2006; Garfinkel et al. 2006; Garfinkel 2009). Although the timeframes of legal and archival activities are different, with archives generally holding material indefinitely if not 'forever', in the legal context too it is often necessary to care for artefacts for periods longer than digital media and objects can be expected to survive without due care and attention.⁵ It is an area that could benefit significantly from the attention of digital preservation developers and practitioners.

3.4 Security, Privacy, and Digital Rights

The ease with which digital material can be altered, intentionally or accidentally, and the ease with which it can be disseminated, shared, combined, and repurposed, has driven security, privacy, and rights concerns across domains and disciplines. Information and network security, measured in various types of integrity analysis and control, is foundational to digital forensics, while protection of privacy and management of digital rights are at the forefront of archival concerns. While digital forensics addresses privacy and security in the context of intrusion detection and incidence response, digital archivists and curators must be aware of privacy and rights requirements in order to manage description of and access to material entrusted to their care.

4. Shared Theoretical Perspectives

The ensuing portrayal of shared perspectives does not negate the differences in outlook and purpose between forensic examiners operating in a legal context and those adopting the techniques for the purposes of curation and preservation. In the context of law enforcement, there is a perpetrator and a victim, and digital forensics is employed to uncover and present evidence that will be material in the case at issue. Once a legal case has been completed or is closed, the evidence tends to be put aside and stored without further access or management (unless there is an appeal). Long-term preservation of supporting material, including migration to ensure continued accessibility, is often not undertaken. Scholarly

⁵ Personal communication, Tony Sammes and Brian Jenkinson, October 2011.

examination of archival material, on the other hand, continues indefinitely, and is repeated over time as new and varying research goals are adopted. The archivist who secures digital material and initially interprets it through archival analysis and description expects to be followed by historians who investigate the archive decades and centuries later. These purposes are quite different, even if the elimination of hypotheses is a critical approach in each discipline (Fraser and Williams 2011; Fraser 2010), and lead to different applications and requirements of digital forensic tools and techniques.

4.1 Authorship & Identity

There has been a longstanding interest in the identification of forgeries specifically and in ascertaining the origin of all documents generally. Forgeries were rife in medieval and classical times, requiring vigilance with respect to their authenticity at the time and their authentication subsequently by historical scholars. Examination and investigation of handwriting (palaeography) and document analysis have long played a prominent role in identifying authors (Nickell 2005).

The science of diplomatics developed since the 17th century to establish the authenticity, and indirectly, the reliability, of archival documents, in order to determine rights and to identify and eliminate forgeries. Diplomatics is concerned with proving that a document is what it purports to be through the study of its genesis, forms, and transmission, and the relationships of the documents with the actions and persons and with its juridical context. Diplomatic criticism has evolved to analyse and evaluate individual documents in terms of a recognized system of formal elements, through which those documents can be shown to have been “written according to the practice of the time and place indicated in the text, and signed with the name(s) of the person(s) competent to create them” (Duranti 1998).

In the digital environment, the absence of such elements of proof of authorship and identity as handwritten signatures have led to an erosion in trust. This has been addressed over the past 13 years in the InterPARES (International Research on Permanent Authentic Records in Electronic Systems, 1999-2012) Projects, in which the theory and methodology of traditional diplomatics and the principles of archival knowledge were refined and tested to provide a framework for assessing the authenticity of digital records through the development of a new body of knowledge, digital diplomatics. Digital diplomatics offers archivists a powerful methodology for analysing digital records. However, according to Duranti, digital diplomatics alone may not be sufficient to understand the challenges posed to information inscribed by increasingly complex digital systems (Duranti 2009).

Traditional concepts of provenance and identity are severely undermined by the default of anonymity on the Internet. The identity of creator, author, writer or originator may be obscured and separated from the inscribed message by virtue of the layers of technology that mediate between physical person and transmitted document. “Establishing who is behind the keyboard at a given time is perhaps the single most commonly litigated issue involving electronic evidence” (Scanlan 2011). Just as archival principles have been combined with diplomatic concepts to provide a methodology to analyse traditional digital objects, new knowledge from digital forensics may extend digital diplomatics to illuminate growing challenges to issues of provenance, identity, and integrity in increasingly complex digital environments.

4.2 Integrity and Change over Time

Philology, textual criticism, decipherment, stemmatics, phylogenetics and cladistics, historical relatedness, semiotics, and more recently fuzzy hashing, all share an interest in how objects change with

the passage of time. The key concept is relatedness. Historically, it has been much concerned with the development of some writing or work, and contemplates the relationship between objects, entities, existing contemporaneously (e.g., today) or longitudinally through time.

The 17th and 18th centuries saw the deepening of critical scholarship with the development of systematic investigation of literary style, poetic harmony and formal measures, chronological inconsistencies and aberrations, historical incongruities, and the presence and absence of independent, long lasting evidence (Levine 1989). The parallels in stemmatics and phylogenetics and their use in forensics, historical reconstruction, and conjectural criticism is an active area of research today (John 2009; Kraus 2009).

Integrity, once presumed from the controls on the procedures dictated by the creator of a record, now may be assessed in the absence of or further to provenance and explicit identity, and at both the physical (bits) and logical (meaning) layers of the record. Digital forensics offers another way of conceptualizing digital objects and assessing their integrity that can complement and be complemented by digital diplomacies in understanding and assessing the elements of authenticity of digital objects (Duranti and Endicott-Popovsky 2010; Duranti and Rogers 2011).

4.3 Procedures for Establishing Authenticity and Reliability of Evidence

Curation and forensics share a concern with provenance and the application of tested and certifiably reliable protocols and tools: the collection of a set of digital objects, the evidence (legal or historical), and its subsequent demonstrable authentication, once it is in the care of the responsible institution (and its evidence custodian).

Three central requirements of digital forensics match those of archivists: capturing the information without changing it, demonstrating that the information has not been changed or that the changes can be identified, and analysing and auditing the analysis of the information, again without changing it (see John 2008).

Some of the functionality of forensic software can be found in assorted tools that exist independently of the forensic community, some of it freely available on the internet. An important distinction is that forensic software is routinely subject to appraisal and peer examination (not to mention the daily scrutiny of the law courts) as well as increasingly rigorous formal testing conducted according to specified protocols and overseen by independent bodies such as the National Institute of Justice and the National Institute of Standards and Technology in the USA.⁶

Because digital evidence is extracted from digital media, its reliability and integrity depends in part on the means of its extraction, which must be conducted and accounted for according to scientific principles. The assessment of reliability and integrity is based on procedures that are repeatable, verifiable, objective, and transparent. Digital forensics tools are subject to a demonstration that they have been tested, that the error rate is known and within acceptable limits, that the tool or procedure has been published and subjected to peer review, and that it is generally accepted in the relevant scientific community (Carrier 2003). Admittedly, there is much more testing to be done and its implications remain to be comprehensively implemented and consolidated across practicing organizations.

⁶ <http://www.cftt.nist.gov/>; <http://www.nsrll.nist.gov/>.

4.4 Digital Materiality, Virtualisation & the Importance of Ornament

Just as curators and scholars attach significance to the materiality of objects, to their look and feel and behaviour, in the fullest of detail, so forensic examiners have come to realise the importance of these qualities, with for example the emergence of virtual forensic computing, involving the use of virtual machines, emulators and 3D virtual reality. This has led to the development of tools such as Virtual Forensic Computing (VFC) produced by MD5 (UK) and based on work conducted at Cranfield University in the UK (Penhallurick 2005). At the end of forensic examination and analysis it is necessary to present the material in a manner that matches (to varying degrees) the original computer environment as well as the real landscape setting itself (Schofield 2009). An example of a textbook that provides general practical advice for the presentation of digital evidence in court is that of Sammes and Jenkinson (2007).

5. Looking Back to Look Forward

5.1 The Forensics of Ancestral Computers

The rapid pace of technological change means that forensic researchers are continually having to explore new techniques and develop new tools to support security and counter criminality. Over time the modern forensics community tends to become less focused on earlier computing technologies and forensic techniques. To forensics experts concerned with staying ahead of criminal activity in cyberspace, the progress of the previous decade is becoming less relevant (Garfinkel 2010). However, the tools and techniques created to analyse older technology remain crucial to scholars such as historians and archivists, who increasingly rely on digitized and born digital material in a variety of ancestral and legacy formats. In the archival context, it is unlikely that computing in, say, the 1990s will cease to be of any interest to digital scholars. This requirement will motivate continuing research into the forensics of ancestral computers and other digital devices.

In principle, there are two major kinds of ancestral computer forensic techniques, tools and knowledge bases: (i) those developed by earlier generations of practicing computer forensic experts; and (ii) those developed subsequently as a retrospective research activity by contemporary classic computer enthusiasts, computer history conservationists, and, increasingly, digital scholars and curators. A third and emerging source of expertise might be the current generation of researchers and developers operating in the field of personal information management (PIM) and the research output of this and related fields such as software development.

Future researchers of ancestral computer forensics would benefit from being able to look back over many decades and examine the way the forensic capabilities have changed. With early disks, for example, the low track density resulted in greater space between each track, and the head would wander over the floppy disk or platter. Deletion and overwriting would be incomplete and data potentially could be retrieved from earlier writes (Nelson et al. 2004) in ways that would be more forbidding with comparable technology today.

5.2 Digital Forensics: Knowledge Retention

An important requirement from the curatorial point of view is to document digital forensics knowledge even before it ceases to be of strong relevance to the wider forensics community. The earlier experiences

of the forensics community represent an important resource, to match that of the original developers and usability designers of the hardware and software. This knowledge is already being lost, according to several forensics experts (Charters 2009; Garfinkel 2010; Pollitt 2010), and there are efforts to preserve it, at least from the perspective of the forensics community, for the purposes of better understanding future directions (Charters 2009) rather than supporting its use with obsolete media. The British Library has initiated discussions with forensic practitioners about documenting early computer forensic experiences and tools, with the aim to record interviews in due course.

5.3 History of Digital Forensics: Introduction

In the past three years three short historical retrospectives have been written that capture early development and identify future directions of digital forensics practice (Charters 2009; Pollitt 2010; Garfinkel 2010). These articles are important first-hand accounts of the evolution of the discipline and predictions for future growth reflecting the intelligence community, law enforcement and academic perspectives. Each author has been and continues to be influential in shaping the field. Each has approached the task from his particular point of view, and yet there are similarities. All accounts track the changes in computer technology, which have driven the course of digital forensics, and arrive at complementary yet distinct conclusions about future directions.

Charters' background is in IT security and information assurance spanning more than 20 years in the United States' Intelligence Community. Like Pollitt's informant, Charters believes that by "looking at the way forensics evolved in the past, with an eye to the pressures that guided its evolution, we could get a better understanding of how forensics would evolve in the near future." He explains the development of computer forensics in three stages of evolution—the Ad Hoc Phase, the Structured Phase, and the Enterprise Phase.

The twin lenses that Charters focuses on the development of digital forensics are those of policy and procedure, and forensic tool development. The Ad Hoc Phase was characterized by lack of structure, goals, Appropriate Use policy and procedures, and challenges to the accuracy of forensic tools. This phase appears to be cyclical and transcend computer technology—it happened in the mainframe era and again in the microprocessor era. (Charters wonders if it is doomed to happen again in the wake of new technologies.) The resulting confusion led to the imposition of structure expressed in policy-based programs, defined and coordinated procedures closely aligned with the policy, and a requirement for—and development of—forensically sound tools—the Structured Phase. The Enterprise Phase is characterized by real-time collection, tailored field tools and forensics-as-a-service, built seamlessly into the infrastructure. The future, he predicts, will be aimed at greater automation and interoperability, proactive collection and analysis, and increased focus on standards in software architectures and reporting.

These phases map neatly to the concept of epochs, with which Pollitt outlines the salient characteristics of the profession. Pollitt begin with "pre-history" (pre-1985 characterized by mainframe computing, an ad hoc and individualized approach to digital forensics), and, adopting a lifecycle model, moves from "infancy" (stand-alone PCs and dial-up internet, forensics in service of law enforcement, development of the first forensics groups and task forces⁷), through "childhood and adolescence" (rapid

⁷ For example, the FBI, IACIS (International Association of Computer Investigative Specialists), and IOCE (International Organization on Computer Evidence).

development of diverse technologies, broadband, increasing professionalization⁸), with “maturity” (characterized by greater opportunities for academic training, certification, standardization, and research) still to come. Within that framework he defines the discipline through the elements of people, targets, tools, organizations, and the community as a whole. Pollitt, a former military officer with over twenty years as a Special Agent of the Federal Bureau of Investigation, approaches the history through the lens of law enforcement. His experience spans the epochs he describes, and his influence is evident in the development of standards, and the recognition of digital forensics as a forensic discipline by the American Society of Crime Laboratory Directors/Laboratory Accreditation Board (Pollitt, 2010). These epochs are particularly relevant in an analysis of digital cultural heritage and the application of ancestral computing. Garfinkel, an academic practitioner who has developed computer forensics tools, conducted computer-related research and authored books and articles published in the academic and popular press, suggests a research agenda that will carry digital forensics into the next phase of development, and sets the stage by summarizing the characteristics of past phases (2010). He argues that we are coming to the end of a “Golden Age” of computer forensics characterized by relative stability of operating systems and file formats, examinations largely confined to a single computer system, removable storage devices, and reasonably good and easy-to-use tools coupled with rapid growth of research and increasing professionalism. We are facing an impending crisis, however, brought on by advances and fundamental changes in the computer industry—specifically increased storage capacity, proliferation of devices, operating systems and file formats, pervasive encryption, use of the cloud for remote processing and storage, and increasing legal challenges to search and seizure that limit the scope of investigations. This article is particularly important for its suggestion that research ought to focus on a completely new approach to understanding forensic data through the development of new abstractions for data representation. If this is supported by standards and procedures that use these abstractions for testing and validation of research products, the result will be lower costs and improved quality.

5.4 History of Digital Forensics: Organisations

The birth of the digital forensics field can be dated from the early 1980s. In 1984, the FBI established its Magnetic Media Program, which subsequently became the Computer Analysis and Response Team (CART). In 1985 Scotland Yard founded the Computer Crime Unit (CCU), which provided training courses at Interpol. The Federal Law Enforcement Training (FLETC) programs played a key role in dispensing an understanding of the recovery of digital data.

The literature is sparse for this early period in the development of investigative techniques for crimes involving computers. Most of the literature devoted to computer crime, found in computing and accounting journals, focuses on proactive security intended to prevent criminal acts by reducing opportunity (Collier and Spaul 1992). In 1986, however, an article appeared in the journal *Computers & Security* that addressed the problem from the perspective of the investigation of a crime after the fact (Stanley 1986).

Possibly the first published use of the term “computer forensics” in the academic literature appeared six years later in an article entitled “A forensic methodology for countering computer crime”

⁸ Including establishment of SWGDE (Scientific Working Group on Digital Evidence), DFRWS (Digital Forensic Research Workshop), and IFIP (International Federation for Information Processing) Working Group on Digital Forensics.

(Collier and Spaul 1992). Collier and Spaul proposed the term “computer forensics” as a label for “existing but very limited activities amongst the police and consultancy firms” and advocated for its inclusion in the realm of traditional forensic sciences. They identified the skills required of a computer forensic expert to be multi-disciplinary, including investigative capacity, legal knowledge (including the law of evidence, rules of hearsay and admissibility), courtroom presentation skills as well as knowledge of computers. Although the term appears not to have existed formally in print prior to this publication, it had long been used informally (Sommer 1998; see also Sommer 1992)

The bulk of published material begins in the mid-1990s, originating from international gatherings of law enforcement. Some of these, like the FBI international conferences on computer evidence, were symposia devoted to computer crime (Noblett, Pollitt, and Presley 2000). Others were long-established gatherings that began to include sessions on computer forensics, such as Interpol’s International Forensic Science Symposia.

It was not until the 1990s that standardisation and dissemination began in earnest. In the UK the Computer Misuse Act was introduced in 1990, and was specifically designed to deal with criminal activities associated with computer systems, which in turn motivated greater attention towards evidence handling and other procedures.

The Royal College of Military Science (later the Defence Academy of the UK) commenced courses soon afterwards: initially as short courses, subsequently at MSc and Ph.D. levels. The Interpol European Working Party on Information Technology Crime was established in 1993, and quickly followed by the formation of the International Organisation on Computer Evidence in 1995.

Computer forensics has been defined as “the application of science and engineering to the legal problem of digital evidence,” and the admissibility of digital evidence has been related to the legal requirements of comparable paper-based evidence (Pollitt 1995). Pollitt compares the document paradigm (traditional, paper-based) with the (then) new digital paradigm in order to situate digital evidence within the legal process. He summarizes the investigative process for traditional document in four phases: acquisition -> identification -> evaluation -> admission of evidence. This has become the basis for all subsequent process models.

A handbook entitled *Computer Evidence*, produced by Edward Wilding, 1997, outlined techniques for PCs using DOS and the use of DIBS (Digital Image Backup System) and included details about the handling of evidence (Wilding 1997). This was followed by *Forensic Computing*, by Tony Sammes and Brian Jenkinson (2000), which combined first principles with practical investigation and incorporated a pioneering section on electronic organisers (a second edition appeared in 2007). It contains some of the original source references used by the forensic community at the time. Other influential texts such as *File System Forensic Analysis* by Brian Carrier and *Forensic Discovery* by Dan Farmer and Wietse Venema, both published in 2005, are listed at the end of this paper (Carrier 2005; Farmer and Venema 2005).

5.5 History of Computer Forensics: Software

Tools were produced by government agencies such as the Royal Canadian Mounted Police (RCMP) in Ottawa and the US Internal Revenue Service (IRS); but over the years, many advances in the field have been due to individual law enforcement officers and to computer technicians in the private sector (Sommer 1998).

Some investigators wrote their own tools in C and assembly language; examiners carried out their work from the DOS command prompt and through the use of hexadecimal editors. The Windows environment was avoided due to its propensity to alter data and to write to the drive.

A tool called X-Tree Gold arose in the 1980s, useful for recognising file types and retrieving lost or deleted files. Norton Disk Edit soon followed, and became a preferred tool. Later still came an expanded set of Norton Utilities as well as PC Tools. Of distinctive interest are the GammaTech Utilities for inspection and data recovery of computers with OS/2 (Wilding 1997; Nelson et al. 2004).

In the 1990s prominent suites of command line utilities became available: Maresware Forensic Processing Software Suite; and The Coroner's Toolkit (TCT). Designed for the forensic analysis of compromised Unix systems, TCT suffered from not being portable between systems and from its inability to cater for file systems other than those of Unix. It has since evolved into Sleuth Kit and Autopsy. Also noteworthy from this period were DriveSpy, Image and PDBlock of Digital Intelligence.

Around this time, ASR Data created Expert Witness for the Macintosh, the GUI forerunner of EnCase. The two GUI tools that would come to dominate computer forensics both arose in the late 1990s: EnCase of Guidance Software and Forensic Tool Kit of AccessData. For the purpose of viewing and handling a wide variety of file types, it was common for forensics experts to adopt existing viewing software such as QuickView Plus, Outside In, LView Pro, Magellan, ACDSee, ThumbsPlus and IrfanView.

A brief example of how software evolves, and how one developer picks up where another left off, is provided by file carvers which assist in the recovery of deleted files, acting independently of the file system by simply seeking to identify files through their file signatures and other identifiers. The carving tool Foremost was originally created in March 2001 by Jesse Kornblum and Kris Kendall from the United States Air Force Office of Special Investigations for analysing and recovering deleted files. It was itself inspired by the program called CarvThis that had been developed in 1999 by Defense Computer Forensics Lab although it was never released to the general public. Foremost is now open source, and the code is maintained by Nick Mikus (Spenneberg 2008).

Another tool known as Scalpel was derived from Foremost 0.69 by Golden G. Richard III, and Scalpel became highly regarded, said to be recommended by Foremost developers themselves. In recent years, Foremost has received yet more attention: "Although Scalpel was far superior to its predecessor in 2005—with the ability to analyse images around 10 times faster—Foremost has caught up recently thanks to Nick Mikus, and it is actually superior to its derivative for some tasks" (Spenneberg 2008).

5.6 History of Computer Forensics: Legacy Machines

Nelson and colleagues have recommended that forensic practitioners retain legacy equipment for as long as possible — both software and hardware — suggesting that there are some forensic tasks using current operating systems and hardware, that cannot be performed with modern tools: "To be an effective computing investigator and forensic examiner, you should maintain a library of old operating systems and application software" (Nelson et al. 2004).

Even as the more universal and forensically dedicated tools were becoming firmly established, practitioners were reminding colleagues of the need to retain earlier computers and tools, as Microsoft, Apple and Unix/Linux became predominant. Computers such as Commodore 64, Osborne I or Kaypro running CP/M may be needed; or even a Pentium I or 486 PC for accessing an early IDE disk (Nelson et al. 2004).

5.7 Data Recovery

Alongside the development of security and forensic computing, other professions were already conducting many of the activities that are today embraced by forensics (Kane and Hopkins 1993, with a 3.5 inch floppy disk that “Contains 16 life saving utilities”). There is a multitude of publications on data recovery each catering for the diverse early computer systems as well as current ones. Data recovery companies today include: MjM data recovery, Disklabs, Xytron Data Recovery, DPTS, eMag Solutions). Professional associations include: Global Data Recovery Alliance;⁹ and International Professional Data Recovery Association (IPDRA).¹⁰

5.8 Reverse Engineering for Interoperability

Reverse engineering was being conducted not only by those seeking to understand software or computer programs (including malware) (Eilam 2005) but in order to understand file formats and so be able to address interoperability on behalf of publishers. For example, InterMedia (UK) produced a floppy disk conversion system so that files on an extensive variety of disks could be copied to a publisher’s own editing system (see John 2008). A longstanding tool in reverse engineering continuing today is IDA, an interactive disassembler and debugger¹¹ (Eagle 2008).

6. Classic, Retro, Vintage Computing & Gaming

6.1 Rosetta Machines

Digital scholars have invoked the concept of the Rosetta machine, any computer that is peculiarly preadapted for the interflow of information between generations of computers and storage media, citing the Macintosh Wallstreet edition of the G3 PowerBook as the holotype for this kind of technology: manufactured in 1998 it came with swappable CD, DVD, and floppy drives capable of reading 800K and 400K disks, an Ethernet port, a PCMCIA slot permitting the addition of USB ports and access to an external hard drive; a swappable zip drive was also available (Kirschenbaum, Ovenden, and Redwine 2010).

A possible candidate as a Rosetta machine is the Cat Mac, a system that was designed to allow individuals to build their own Apple Macintosh computers (Brant 1991). The guide to the system also highlights the possibility of running DOS on a Mac, and an Apple OS on a PC or Atari. In addition to matching specific models it was possible to mix and match some of the components; and it might in this way be possible to build a number of dedicated and versatile Rosetta machines—if the necessary components could be found. It accepted hard drives including a removable version by Wetex, floppy drives, Iomega’s Bernoulli design (predecessor of the Zip disk), SyQuest’s and Ricoh’s removable cartridges, optical drives (Magneto Optical, MO; Erasable Optical, EO; Write Once Read Many, WORM; Read Only, CD-ROM); tape drives including data cassettes, akin to audio cassettes but significantly different internally, and DAT 4mm cartridges; limited networking is also feasible.

¹⁰ <http://ipdra.org>.

¹¹ <http://www.hex-rays.com/products/ida/overview.shtml>.

6.2 Enthusiast Computing

Due to their ‘universal computer’ nature, computers lend themselves to self design and manipulation. Personal computing was famously driven by hobbyists experimenting at home. Apple I was a circuit design and board rather than a complete computer and even with later finished models, enthusiasts were invited to build their own—a tradition that continues to this day (Owad 2005). Subsequently this was discouraged by Apple but remained commonplace with PCs. Customers were encouraged to upgrade their computers themselves, and often needed to install their own drivers and generally tinker.

This ‘universality’ led, of course, to numerous types of computing devices; but it also yielded a large community of enthusiasts, many of them associated with games and gaming: in time, gradually evolving into a classic and retro computing community—with much of the activity being directed at the capture, emulation and preservation of computer games (John 2008; McDonough et al. 2010, see also recent news concerning the Princess of Persia source code).¹² The role of ancestral computing enthusiasts has been outlined previously (John 2008); further examples are a web site dedicated to the Spectrum computer¹³ and another that is concerned with the capture of Apple II disks (with a link to a video on how to clean the disk drive).¹⁴

Computer experts with an interest in games and other early computer technologies specialised in this area and made it possible to capture and interpret a wide variety of floppy disk formats, notably Disk2FDI which produces disk images in an open file format and has been used to process a major collection of games for the BnF, Bibliothèque nationale de France.¹⁵

6.3 Specialist Modern Technology

As Doug Reside has observed, ancestral (obsolete) equipment, such as a computer with a 5.25” floppy disk drive, requires considerable attention and care; and in the long run modern specialist replacement technology is the sustainable option (Reside 2010; Reside 2011).

The Software Preservation Society,¹⁶ a group derived from an interest in gaming and initially the Amiga computer, has made available the KryoFlux and accompanying software, a device for reading floppy disk drives via a USB connector. It works as standard with 3.5” and 5.25” floppy disks and has been made to work recently¹⁷ with 8” floppy disks with the help of the FDADAP floppy disk adapter.¹⁸ The recently formed company has been exploring a number of business models, selling the basic setup to individuals at a lower price while charging institutions a higher fee, with support provided. There is a GUI emerging as an advanced form of DTC (DiskTool Console), and a forensic version of the KryoFlux has been promoted.

An important consideration is the nature of the information that the KryoFlux yields; there are detailed log files that document the capture with hash values calculated. There are two kinds of capture

¹⁸ <http://www.dbit.com/fdadap.html>.

output: fundamentally the stream files which represent the magnetic flux transitions; and interpreted sector disk images. The stream files are not intended for long term preservation as their encoding is optimised for the transfer of the binary stream “over the wire while a track is being read.” Software Preservation Society state: “Long term storage of disk data should be kept in the DRAFT format.” However, DRAFT (Data Recording Archival Flux Format) is not yet complete.¹⁹ There is another format known as IPF, Interchangeable Preservation Format, and the forum for KryoFlux indicates that the company has long reflected on how best to licence the IPF library source code; it has released the IPF decoder library under a modified MAME licence.²⁰

Visualisation tends to be seen as a tool that is useful at the end of the curatorial or forensic lifecycle but it can also be used at other stages. A new software tool for use with the KryoFlux demonstrates the value of visualising the condition and formatting of floppy disks at the level of the magnetic flux transitions: in identifying unformatted, healthy and degraded disks and much else besides. For further details see the KryoFlux website.

Other useful tools for working with floppy disks include the Catweasel, Disc Ferret and FC5025 controller.²¹

6.4 Reconfigurable Hardware, Emulation Software

Despite these important advances, digital capture is still dependent on the original disk drives. Perhaps an enterprising group will create a modern version of disk drives, using reconfigurable hardware. A step in the right direction is the C-One which is a modern computer (motherboard) designed to be reconfigured to behave like one or more earlier computers.²²

The ultimate in reconfigurability, of course, lies in the virtualisation of machines and components. Much of the understanding and the techniques being developed in the design of emulators and universal virtual machines are truly forensic in approach and standard. Important projects in this area include Dioscuri, Qemu, KEEP, POCOS and Planets.²³

7. Software Licensing & Preservation

The curation of personal archives where the original look and feel are critical for scholarship currently relies on the use of ancestral software. Most especially, the booting from an original disk image entails the use of the original software residing on the disk. What are the implications for curatorial examination, for access, for long-term preservation? (In July 2012, The Court of Justice of the European Union ruled

that it is legal to trade ‘used’ software provided the reseller makes his or her own copy unusable following the sale, a decision that seems to have potentially beneficial implications for digital preservation.²⁴⁾

A prototype, somewhat procrustean, policy might be that the originators agree to forego further use of the software so that the curators may inherit the right to use it on behalf of the repository institution. In fact software licensing is extremely diverse and complex. Some of the issues of software preservation generally have received attention in recent years (Matthews et al. 2008), not least in the context of computer games and virtual worlds (McDonough et al. 2010; see also John et al. 2010) A Technology Watch paper from the Digital Preservation Coalition by Andrew Charlesworth has examined Intellectual Property.²⁵

8. Lessons for Mobile Forensics?

Challenges in the forensics of handheld and mobile devices arise primarily from the diversity of approaches taken by systems with many idiosyncratic qualities, which differ from those that are familiar from desktop and laptop forensics: platforms, encodings, operating systems, memory systems, interface methods, storage technologies, software agents and APIs (Application Programming Interface), timestamps all may differ in special and frequently proprietary ways; and products from the same vendor can differ significantly. It is reminiscent of the early days of personal computing except that mobile devices change even more frequently. Exemplars of the devices as well as a stockpile of power and data connectors and cables will be invaluable in the years ahead.

Is it possible that experiences with early computing can provide lessons for the present in this respect?

9. Tools & Software Repository

Planets²⁶ initiated a registry of software tools suitable for digital preservation, and the Digital Lives Synthesis promoted the notion of corpora for the digital curation of personal digital objects that can serve for archival testing. In addition to collecting software, ancestral software as a matter of urgency, it would be beneficial for some centres to collect forensic tools and software, especially those used during the early history of computer forensics.

There are tools for changing metadata (inappropriately) such as date-time; but these have the (fortunate) weakness that few are truly certified in their ability to do what they claim to do and may be incomplete in their actions. On the other hand it means that an understanding and documentation of just what these tools do may be necessary in order to detect forgery.

10. Knowledge Reuse & Documentation

The field of digital forensics may be young, but it is rich and complex. From its beginnings as a technical support to law enforcement, it has developed into an accepted forensic science, and its tools and techniques are valuable in both reactive and proactive and preventative endeavors. At least within the close confines of the legal forensics community, there is an emerging tradition of case files, anecdotes and instances from which to draw experience and judicious insights. Curatorial and archival forensics and digital scholarship have only just begun in the field of forensic and ancestral computing.

Documentation is a persistent problem. As Linus Torvalds replied on being asked—around the time when Linux 3.0 became available—to state the toughest technical problem during the development of Linux so far: “The two areas where we’ve had serious problems was documentation and help from hardware manufacturers.”²⁷

A potential area of collaboration among institutions and across forensic and preservation disciplines is in the archiving of manuals, datasheets, for hardware as well as software, and in approaching computer companies. Ronald van der Knijf warns that existing embedded systems will have been replaced within a decade: “There is a high demand for cooperation with the industry because a lot of time is spent building knowledge about the working and behavior of systems that are designed and built by people who already have most of that knowledge but are not allowed to share it” (van der Knijff 2012).

11. Virtualisation of Ancestral Computers

The virtual experience is highly portable, meaning that it can be made available on workstations with restricted access, a single reading room or, where appropriate and permitted, on the web. The usual way to interact with the original system is to ‘restore’ the original disk (as a clone, a hard drive) from the disk image, and boot up this clone. An alternative, more flexible, approach is to make use of virtual computing tools whereby virtual hard drives are accessed by a virtual machine (Barrett and Kipper 2010)

The possibility of using a disk image to virtually boot disks derived from personal archives was discussed in John (2008). The initial but still evolving approach at the eMSS Lab in the British Library may be outlined. The software Mount Image Pro of GetData²⁸ may be used to mount multiple ‘dd’ disk image files as well as virtual file systems such as those of VMware; it also works with the AFF image file and the proprietary one of EnCase. Having mounted the disk image as an emulated physical disk, a suitable virtual machine can be created (e.g., VMware) and the ‘raw disk’ can be added to the virtual machine, which is booted up using the original operating system that resides in the ‘raw disk’.²⁹ Virtual machines may be configured manually or quasi-automatically although some tweaking is often necessary.

One of the key advantages of using a virtual environment (instead of booting a physical clone of a physical disk) is that it allows for highly repeatable, controlled and referable experiences suitable for the scholar or scientist who is required to study the subject in an academically accountable way.

²⁷ Interview of Linus Torvalds, *Linux Magazine* 131 (October 2011): 16-18.

²⁸ <http://www.getdata.com>; <http://www.mountimage.com>; other useful tools include LiveView, VirtualBox, Xen, VMware and VMware Fusion, and Parallels.

²⁹ Sometimes it is helpful to first create a virtual disk (e.g., using VMware) and then to clone the ‘raw disk’ to this virtual disk (see Penhallurick 2005).

A common approach is to build a virtual environment from scratch: first the operating system, then the necessary application software and then add the files for viewing. Frequently it requires careful configuration and testing. A significant advantage of capturing entire disks—or at least capturing the software (and profiles of the hardware and services) along with the focal files is that the captured disk ‘image’ comes readymade (in many cases) with the appropriate settings and preferences of the archive’s originator, notably with the application software satisfactorily tuned with the operating system; moreover, the captured system is authenticated by means of the hash values, and software can be identified in detail by means of hash libraries.

It enables scholars to explore and immerse themselves in an environment that matches that of the creator, with a virtualised equivalent of the original folder structure and computer desktop arrangement in place and files available for examination. It is even possible, depending on availability and condition to set up this environment on the original computer with a new hard drive. Where a person retains system snapshots (or shadow volumes) of the entire contents of a computer throughout its life, it will be possible for the researcher to follow its evolution through time.

Sometimes the originator’s setup will be awry and the system prone to malfunction; in which case some accountable tinkering or in depth manipulation of a replicate of the archival disk image may be necessary to produce an access version of the system.

Another issue is the speed of response under emulation: for some scholarly purposes it may be too slow. A possible solution would be to offer an option for a realistic pace and behaviour, and another option for a more responsive interaction, depending on the requirements of the scholar. An ultimate goal would be to engineer a combination of high performance searching and exploration with the option to switch where desired to high fidelity viewing.

Scholarly note taking may be enhanced through the retention of VM snapshots or through video capture of screen activity. A challenge remains in devising a widely accepted means of referencing the virtual experience for academic research.

12. Open Source Emulators of Ancestral Computers

It is possible to use emulators of ancestral computers for the same purpose. For example, the open source emulator SheepShaver has been used by the British Library to mount and boot a forensically sound disk image of a hard drive from a G3 PowerPC Apple Macintosh with OS 8.³⁰ The computer in question is from the archive of the evolutionary biologist W. D. Hamilton. Each time the disk image is booted within the SheepShaver emulator, one of a number of desktop pictures (e.g., the forest and river system of Amazonia) becomes apparent along with the numerous ‘objects’ on the virtual desktop; if the emulated computer is left inactive for a while, a screen saver from the original computer appears. Files can be opened using the original software that resides on the G3 hard drive including Microsoft Word 4, Acrobat Reader and Photoshop 4. Most excitingly, it is possible to run C++ programs using the CodeWarrior software that exists on the original disk, with dynamical graphs of the program output; moreover, users may potentially change the parameters of the original program and run a modified version for themselves.

The archival technical team at Emory University has demonstrated a similar arrangement for the digital archive of Salman Rushdie, and as Naomi Nelson observed:

³⁰ <http://www.emaculation.com/doku.php/sheepshaver>.

The emulated environment is as close as we can get to recreating Rushdie's desktop for the researcher. Instead of isolated files on floppies, we have the entire context in which he worked. We can see how he used technology and the growing Web as part of his creative process.³¹

13. Reservation, Redaction, Confinement

Tools for manipulating disk images and virtual machines are useful in several ways but most critically for editing disk images in order to comply with privacy requirements; some files may be embargoed for a number of years or decades. Following selection of digital objects that have been agreed and accepted for accession by the repository, Winimage, for instance, can be used to delete folders and files from access versions to cater for privacy agreements while retaining bootable functionality. An important aspect for future research is for the security of this editing and deletion process to be accountable and demonstrably secure.

14. Conclusion

Descriptive process models, however generalized, are necessarily limited in their ability to suggest a theory of digital forensics that identifies concepts and functional requirements of the discipline. Beebe and Clark hint at this in their articulation of digital investigative principles (Beebe and Clark 2005). The goal is to develop a conceptual model that is based on more than "investigative experiences and biases" (Carrier and Spafford 2006). A model that succeeds in this will conceptualize the requirements for "forensic soundness" of the resulting analysis and support the development of procedural methods and tools (Casey 2007).

At the most basic level, abstracted models of digital forensics activities are based on three major functions: acquisition, analysis, and presentation (Carrier 2003). The theoretical concepts to be embedded in and realized through any abstract model are revealed in principles of practice that protect the authenticity, integrity, and reliability of digital material for the immediate purpose, whether that be presentation of digital evidence at trial or investigation of intrusion. Increasingly, a fourth function could be proposed—that of long-term preservation as required, or at least the possibility of long-term preservation.

This can be compared with key archival functions, articulated in a wealth of scholarly archival literature, and central to the work of digital heritage preservation: appraisal and acquisition, arrangement and description, retention and preservation. Preservation of digital heritage for use by current and future scholars depends on tools and methodologies that protect the authenticity, integrity, and reliability of digital material, and ensure its accessibility and usability over time and across technological change. Well-established for documents and records in traditional media, the affordances of digital technologies are forcing archivists to take up new tools and techniques from the digital forensics toolkit.³²

The future, for cultural heritage, depends on digital forensics knowledge from the past.

Giving a Permanent Digital Voice to the Silenced

For the Children Taken ...

The Challenge to Truth Commissions in Building digital collections for research and long-term preservation

Terry Reilly¹

*Manager, Document Acquisition and Collections, Truth and Reconciliation Commission of Canada,
University of Calgary, Canada*

Abstract

This paper presents a case study of efforts to fulfill the Mandate of the Indian Residential Schools Truth and Reconciliation Commission (TRC) which includes among its primary goals the responsibility to e) Identify sources and create as complete an historical record as possible of the IRS system and legacy. The record shall be preserved and made accessible to the public for future study and use. This paper explores the challenges in building collaborative teams across corporate and government cultures, and the results of negotiating the concept of “relevance” across differing private and public archival cultures, and ensuring authenticity and discoverability when we present dynamic video within archival descriptive systems. The paper will include an interactive demonstration of the results achieved in our on-line OLTRC databases. In order to fulfill a requirement to create a permanent repository the Commissioners have initiated a process to establish a National Research Centre and ensure the preservation of its archives. The paper presents some of the challenges of moving the collections into an as yet unspecified archival environment.

Author

Terry Reilly has been Manager of Document Acquisition and Collections for the Truth and Reconciliation Commission of Canada since December 2010. She serves the Commission on Interchange from her academic position as an archivist at the University of Calgary, Alberta, Canada. She has served as Director of Archives and Special Collections at the University of Calgary and as General Synod Archivist of the Anglican Church of Canada. She is a past president of the Association of Canadian Archivists and currently serves as the chair of the Archivists of Religious Collection Section of the Society of American Archivists. She holds an M.A. in history from York University in Toronto and has been a Bentley Fellow.

“The road we travel is equal in importance to the destination we seek. There are no shortcuts. When it comes to truth and reconciliation, we are all forced to go the distance.”

-Justice Murray Sinclair,

*Chair of the Truth and Reconciliation Commission of Canada, to the Canadian Senate
Standing Committee on Aboriginal Peoples, September 28, 2010*

1. Introduction

While most Truth Commissions are established by governments in a transition from authoritarian to more democratic rule² the Canadian Truth and Reconciliation Commission has been established as part of the

¹ Any opinions and all errors herein are my own and not those of the TRC.

² See Trudy Huscamp Peterson, *Final Acts: A Guide to Preserving Records of truth Commissions* (Washington, D.C. and Baltimore, MD: Woodrow Wilson Centre and Johns Hopkins University Press, 2005).

Settlement agreement of the largest class action law suit in Canadian history. Although has been no regime change in Canada, the Commission is similar to others in that its mandate is time limited and the three Commissioners are required to produce a final report.³

2. Background⁴

Up until the 1990s, the Canadian government, in partnership with a number of Christian churches, operated a residential school system for Aboriginal children. These government-funded, usually church-run schools and residences were set up to assimilate Aboriginal people forcibly into the Canadian mainstream by eliminating parental and community involvement in the intellectual, cultural, and spiritual development of Aboriginal children. More than 150,000 First Nations, Inuit, and Métis children were placed in what were known as Indian residential schools. As a matter of policy, the children commonly were forbidden to speak their own language or engage in their own cultural and spiritual practices. Generations of children were traumatized by the experience.

The lack of parental and family involvement in the upbringing of their own children also denied those same children the ability to develop parenting skills. There are an estimated 80,000 former students still living today. Because residential schools operated for well more than a century, their impact has been transmitted from grandparents to parents to children. This legacy from one generation to the next has contributed to social problems, poor health, and low educational success rates in Aboriginal communities today. The 1996 Canadian Royal Commission on Aboriginal Peoples⁵ and various other reports and inquiries have documented the emotional, physical, and sexual abuse that many children experienced during their school years. Beginning in the mid-1990s, thousands of former students took legal action against the churches that ran the schools and the federal government that funded them. These civil lawsuits sought compensation for the injuries that individuals had sustained, and for loss of language and culture. They were the basis of several large class-action suits that were resolved in 2007 with the implementation of the Indian Residential Schools Settlement Agreement, the largest class-action settlement in Canadian history. The Agreement, which is being implemented under court supervision, is intended to begin repairing the harm caused by the residential school system.⁶

In addition to providing compensation to former students, the Agreement established the Truth and Reconciliation Commission of Canada with a budget of \$60-million and a five-year term. The Commission's overarching purposes are to: reveal to Canadians the complex truth about the history and the ongoing legacy of the church-run residential schools, in a manner that fully documents the individual and collective harms perpetrated against Aboriginal peoples, and honours the resiliency and courage of former students, their families, and communities; and guide and inspire a process of truth and healing, leading toward reconciliation within Aboriginal families, and between Aboriginal peoples and non-Aboriginal communities, churches, governments, and Canadians generally. It is hoped that the process will work to renew relationships on a basis of inclusion, mutual understanding, and respect.

³ The Mandate of the Truth and Reconciliation Commission is found in *Schedule N of the Indian Residential Schools Settlement Agreement* see www.trc.ca/OurMandate.

⁴ *Truth and Reconciliation Commission Interim Report*, Truth and Reconciliation Commission of Canada, Winnipeg and Ottawa, 2012. This publication and its related history book *They Came for the Children: Canada Aboriginal Peoples and Residential Schools*, are freely available at www.trc.ca.

⁶ See <http://www.residentialschoolsettlement.ca/english.html>.

While the residential school system operated across Canada, the majority of schools were located in the West and the North. For this reason, the Commission established its head office in Winnipeg, Manitoba. It retained a small Ottawa office, and opened satellite offices in Hobbema, Alberta, to support Commissioner Wilton Littlechild and Yellowknife, Northwest Territories to support Commissioner Marie Wilson and the Inuit Sub-Commission. Chairman and Commissioner Mr. Justice Murray Sinclair's office is in Winnipeg. To extend the Commission's reach into smaller centres and communities and as required by the Settlement Agreement, regional coordinators work to support local Statement Gatherers and related Hearings and also relate to independently organized Community Events.

In recognition of the unique cultures of the Inuit, and the experiences and impacts of residential schools on them, the Truth and Reconciliation Commission also established an Inuit Sub-Commission. It is charged with ensuring that the Commission addresses the challenges to statement gathering and record collection in remote, isolated Inuit communities, and among Inuit throughout Canada. The Inuit Sub-Commission provides the environment and supports necessary to earn the trust of Inuit survivors.

The Commission staff is drawn from the public service, private sector, and non-governmental organizations. As of August 2012, the Commission employed 55 people and 60% are aboriginal employees who work at all levels of the organization. There are three archivists and one part-time video editor in the Document Collections section of the Statement Gathering area.

The Mandate of the Indian Residential Schools Truth and Reconciliation Commission (TRC) has among its primary goals the responsibility to *Identify sources and create as complete an historical record as possible of the IRS system and legacy. The record shall be preserved and made accessible to the public for future study and use.* The work of the Archivists in the Commission's Document Collection team is directed towards fulfilling this Mandate.

3. "Telling Your Truth" - the Commission's work of Statement Gathering

Until now, the voices of those who were directly involved in the day-to-day life of the schools, particularly the former students, have been largely missing from the historical record. The Commission is committed to providing every former residential student—and every person whose life is affected by the residential school system—with the opportunity to create a record of that experience.

The work of other truth and reconciliation commissions has confirmed the particular importance of the statement-giving process as a means to restore dignity and identity to those who have suffered grievous harms. Statement gathering is a central element in the Commission mandate, and statement giving is voluntary with complicated logistics. The statements gathered are being used by the Commission in the preparation of its reports, and eventually will be housed in the National Research Centre. Statement gathering has occurred at National Events, Hearings and Community Events.

The Commission has provided for three distinct statement gathering opportunities/venues. Private Statements are given by one individual to another. Sharing Circles are done in groups with a moderator. They can be as large as 10 or 12 people. Circles are public statements while anyone can witness or listen although they are sometimes conducted without an audience. Sharing Panels are statements given in public places at public events to the TRC Commissioners. All Sharing Panel statements are public and anyone can listen/watch. Members of the Media may also be present at the panels.⁷

⁷ Definitions supplied by Raegan Swanson, TRC archivist, 23 August, 2012.

4. The Statement Gathering Processes – Archival at the Beginning

Statement providers are encouraged to talk about any and all aspects of their lives they feel are important, including times before, during, and after attending a residential school. The family members of survivors, former staff, and others affected by the residential schools also are encouraged to share their experiences.

The Commission recognizes that providing a statement to the Commission is often very emotional and extremely difficult. For this reason, statement providers are given the option of having a health support worker, a cultural support worker, or a professional therapist attend their session. These health supports ensure statement providers are able to talk to someone who can assist them if necessary before and after providing a statement. Individuals are given the option of having an audio or video recording made of their experiences. If they wish, they are given a copy of their statement immediately at the end of the interview. They may choose to provide their statement in writing or over the phone if proper health supports are in place. All individual statement providers must choose whether or not their statement will be retained as confidential or made available for research.

At Sharing Circles and Commission hearings, statements are made in a public setting. People who make their statement in a private setting can choose from two levels of privacy protection. The first option ensures full privacy according to the standards of the federal *Privacy Act*. The second option allows the statement provider to waive certain rights to privacy in the interests of having their experiences known to, and shared with, the greater public.

People who waive those rights are giving consent to the Commission and to the National Research Centre to use their statement for public education purposes or to disclose their statement to third parties for public education purposes in a respectful and dignified manner (such as for third-party documentary films). The Commission and National Research Centre have the authority to decide whether to provide such access. These options are explained carefully to the statement provider before a private statement-gathering session. To date, over half the statement providers have chosen to have their statements recorded for public education purposes. The Commission also ensures that all digital information is transmitted and protected carefully during trips in and out of the field.⁸

The Commission has made it a high priority to gather statements from the elderly or ill, as well as from particularly vulnerable and marginalized former students who are at risk. It has undertaken a number of innovative measures, including a day-long event facilitated by Métis Calgary Family Services at the downtown branch of the Calgary Public Library that focused on collecting statements from homeless individuals. Projects designed to reach those survivors in jails also are underway.⁹

By the end of August 2012, the Commission had collected 2102 private statements.¹⁰ An additional 1374 statements had been given in Sharing Circles and at public hearings. One hundred and fifteen material and artistic submissions had been received. The Commission now has both the mechanisms and process in place to ensure it is able to meet its statement-gathering goals. Regional liaisons play a role in coordinating and organizing a series of specific and targeted visits to communities across the country.

⁸ The Statement Gathering process is governed by The TRC's Statement Gathering Manual and related Supporting Document forms that are developed and controlled by the Archivists. All this documentation is available on the TRC's shared server. Archivists hold regular in person and on-line training sessions and are available for consultations.

⁹ http://www.wawataynews.ca/archive/all/2012/8/16/residential-school-impacts-still-seen-kenora-jail_23298.

¹⁰ Statistics are gathered on a monthly basis for planning purposes.

5. The Settlement Agreement and the Churches who managed the schools

The group of Christian entities known collectively as the historic mission Churches (Anglican, Presbyterian, United and Roman Catholic—including religious orders and dioceses) as signatories to the Settlement Agreement are required to provide the Commission with “all relevant documents relating to the history and or legacy of Indian Residential Schools in Canada.” The first project related to this work was the establishment of an Archivists Working Group. The Group was concerned about identify the issues of concern regarding the portion of documents where there were perceived competing legal obligations; identifying how many documents there were in this category; and, determining solutions to deal with the issues of the implied undertaking in the copies Church records located in the federal NRA collection; questions related to solicitor-client privilege in both federal and Church documents; the application of provincial privacy and Charter law to individuals named in the process; and privacy law more generally.

In 2009-2010 in order to support these discussions and to determine the scope of the project a survey of Church Archives was conducted. Also, the Parties to the Settlement Agreement discussed but did not come to total agreement about the definition of relevance.¹¹ In December 2010 as Manager of Collections I decided that I would proceed with a working definition provided by the archivist of the Presbyterian Church in Canada. The Commission seeks to acquire a comprehensive collection of all relevant documents in any format related to the history and or legacy of Indian Residential Schools in Canada. While this definition does not solve the problem it has allowed the work to proceed.

6. The RFP for the Digital Project

In the fall of 2010 the Commission posted a Request for Proposals on the Government of Canada’s procurement site. The successful applicant was to provide all required , project design and management, human resources, computer hardware, software digitization and meta data expertise to create a digital repository of data bases (initially referred to as a data base) of historical records related to the Indian Residential Schools system. The repository was to be designed include both Government of Canada and Church records. The project team was required to have the capacity to locate records across the country. This was based on information provided by the Church Entities and in particular volume estimates stated in the preliminary surveys that had been submitted to the Archives Working Group. These surveys also showed there were a variety of locations both large and professionally staffed to very small archives, to assist both professional and volunteer whether full-time or more often part-time archivists with their task of identifying records, to describe these records for the Commission, to create digital images and their associated meta data which would enable research by the TRC’s research team and any other researchers contracted by the Commission. The results of the project had to be designed so that they could be made accessible (to the extent that privacy and other related law allows) for public research at the mandated National Research Centre. Bronson Consulting Group of Ottawa and its partners, The History Group, Brechin Imaging and Minisis, Inc., were the successful bidders. There are several parts to the project which has evolved from a single data base platform to a digital repository as the project has unfolded over the past 18 months.

¹¹ The All Parties did determine that “Relevant information is information that is necessary to fulfill any of the mandated goals and activities of the TRC and provided a list of records it felt would satisfy that definition. See Tom McMahon, “Records of Discussion with the All Parties Group,” January–February, 2010.

The Church Archives Project is designed to collect records in either digital or photocopy form and works with six major functions: Contact with the Archives; File Identification; File Review; Digitization; Postprocessing and Metadata tagging. Each of these steps poses its own challenges related to time and budget.¹²

While in general Church archivists have been supportive many are part-time volunteers and some signatories to the Agreement have no personnel with archival training. Many archives are only open for a few hours per week, though in most cases archivists have accommodated the TRC contractors hours. To ensure the best success in year one the TRC deliberately worked with the largest archives and in particular with those that had “national responsibilities.” In addition regional or local archives in British Columbia both Anglican and United Church and the Jesuits of Upper Canada served as pilot sites for smaller archives. File identification is based on finding aid review. Challenges have included incomplete or non-existent finding aids; differing versions between paper and electronic finding aids and in particular paper often hand written finding aids which were known to be out of date. The biggest challenge both for the archivists and the TRC contractors identifying relevant documents are large collections of unaccessioned or unorganized records. Also we did find that in general the Commission’s choices were broader than the archivists though in most cases the archivist did agree to digitization some records have been held back. In the case of records held back under solicitor-client privilege the signatory will provide a list to the Commission’s legal counsel. In order to ensure the highest standards were consistently maintained at every site a detailed set of protocols was developed for on-site work, document handling and finding aid recording. In addition digitization equipment was chosen to ensure that the specific needs of each archives were respected. Explicit folder and documents identification naming conventions were applied to all documents removed from files for digitization. While the option for sheet feeding was available the Church archivists were very reluctant to allow the Commission’s contractors use it even for records that were produced from digital files with the exception of photocopies that had previously been used in litigation. After digitization post processing ensured that the archival relationships between documents were consistently maintained but this did add significant costs and slowed the process of uploading collections into the database. Although significant effort had been made to develop a extensive set of key words based on the Commission’s research requirements it turned out that financial constraints forced the decision to metadata tag only a test subset of the documents from one site and one large set of photographs that had no finding aid. In order to overcome this handicap the Director of Statement Gathering has overseen the development of an on-line search system that is available for the Research Directorate. At the end of the pilot phase there are 202,787 pages of Church records from nine sites, and 980,000 Government of Canada documents received from the NRA system including 129 School Narratives.

The second year of the project has been much more modest. Financial constraints have meant that a new program was developed that limits the Commission’s work to finding aid identification and ingest and returns the work of file review and document production to the Church Archives. The Commission is able to receive either digital or photocopied collections. At this time only digital collections will be added to the repository. Photocopied collections are being accessioned and will be held in the Commissions secure storage.

7. The TRC's digital repository – MINISIS

For now access to the TRCs digital repository is limited to the Commissioners authorized researchers and documents collection staff. At present the repository consists of separate but linked databases for the Church Records, the National Research and Analysis hereafter NRA data transmitted from Aboriginal and Northern Affairs Canada, the Schools data base which contains base line bibliographic and historical data, and the data base for Statements known as VIMS.

The TRC data base partner for this project is Minisis, Inc. There are 2 major sets of functionality in the system: Project management functionality and Data Collection functionality (specifically file identification, meta data tagging and searching). Project management functions include, the tracking and authorization of jobs, workflow which links Activity assignments to the Data Collection functions, estimating and costs and operations controls. Data Collection functions ensure that data entry occurs in an organized fashion and that records can be accessed hierarchically via any of the data sets.

8. Uploading private statement access copies to the digital repository VIMS

Most private and public statements that the TRC has collected were recorded in HD video or in Broadcast Wave format for audio, resulting in very large master media files (for example, 12 minutes of HD video is roughly 2GB in size). These master files are too large to be streamed online from VIMS or easily downloaded. It is therefore necessary to create smaller access copies in compressed audio and video formats (MP3 format at 128kbps for audio files, and MP4 format with H.264 video codec and MP3 audio for video files). These access copies (also called derivatives) are usually about 5% the size of the original master files.

Once created, these access copies are sent to Minisis for upload to VIMS. Like the transcripts, all access copies are given standardized filenames based on the private statement filename (for example, the video access copies associated with private statement 2011-0123 would be titled 2011-0123.1.mp4, 2011-0123.2.mp4, etc.). This allows Minisis to run a script that automatically uploads the access copy media files and link them directly to the VIMS entry of the private statement they are associated with.

9. Creating transcripts of Private Statements and uploading them into the VIMS repository

In the summer of 2012 to assist TRC authorized researchers who require transcripts of Private Statements, we designed an in-house project and contracted with a team of four to create transcriptions. In order to ensure consistent practice the archivists wrote a transcription manual for the contractors to use.

Only non-protected, i.e., Private Statements that are fully available for direct research and quotation in the Commissions publications are being selected for transcription. The archives staff do not have the resources to redact or anonymize statements that have been restricted by the Statement giver. While the selection of private statements for transcription is to be determined by the current needs of the TRC's Researchers the Archivists also select statements for transcription that an approximately even number of statements from each geographical region will be transcribed. Transcribers use a pair of headphones, a Philips Foot Control LFH 2330/00 foot pedal, and a computer work station with Express Scribe Pro software and Microsoft Word installed. Transcribers follow procedures and rules set out in the manual

and are laid out in the transcription template. Once completed and reviewed by one of the archivists transcripts are saved on the Archives server in the same computer folder as the associated private statement's media files and supporting documents. An access copy of all private statement transcripts is also be saved on the TRC's shared drive. The TRC's Researchers are notified when new transcripts are posted to the shared drive.

For purposes of ingest into the VIMS repository 2 copies are made, one a PDF and the other a Word document. These copies are sent to Minisis for upload to VIMS. The text of the copy in Word format is directly copied to a data field in the VIMS entry for the associated private statement; this allows for keyword searching of the entire transcript via the VIMS search interface. Copying the transcript text to a VIMS data field removes all rich text formatting, so it is also necessary to upload and attach the PDF version of the transcript to the VIMS entry. This PDF can be viewed or downloaded by the research team with all the original text formatting intact. We chose PDF as the access copy format due to its widespread use and the security the format offers against unauthorized editing.

Uploading the Word and PDF versions of the transcripts to VIMS is an entirely automated process handled by Minisis, as their programmers have created scripts to extract the text from the Word document and paste it into the appropriate data field in VIMS, and also to upload and link the PDF version of the private statement to its description in VIMS. All that is necessary for this automated process is for me to provide all transcripts with a standardized filename based on the unique statement number. For example, as long as the two versions of the transcript for private statement 2011-0123 are titled 2011-0123.doc and 2011-0123.pdf, they will be automatically processed and uploaded to VIMS by Minisis' scripts.

10. The Settlement Agreement and the Government of Canada – the National Research and Analysis (AANDC) processes

As of July 2012 the major addition to the TRC's digital repository is the NRA (National Research and Analysis directorate of Aboriginal and Northern Affairs Canada, formerly the department of Indian Affairs) database. This database contains historical and contextual records that Canada collected that were relevant to the numerous residential schools litigations. The research and document collection processes differed substantially among litigation offices in eastern Canada, Alberta and western Canada which has resulted in an uneven collection. The Canadian Judicial Council Standard for electronic document transmission in litigation was developed over a number of years and is now the accepted metadata standard for projects of this kind. Provenance or collection level meta data is often not longer visible in the meta data though it may be visible on the individual digital documents. Just over a thousand items have been identified as having meta data but no associated image.

This database contains approximately 1.2 million records, and is made up of both Canada's (including AANDC records held at LAC) and church records. While the records in this database do not contain a complete record of the residential school system, the database is of enormous value to the TRC for both operational and historical purposes.

Also Library and Archives Canada have provided copies of their Red, Black and Schools series for the Repository. These records are currently being analysed and a process for ingesting them into the Minisis system is being developed.

11. Still to Come

Under the general direction of staff of Aboriginal Affairs and Northern Development Canada (the Department of Indian Affairs) surveys are being completed of semi-active and inactive records that relate to residential schools and its legacy but that either are not scheduled or have not been transferred to Library and Archives Canada. The Commission is expecting to receive 33 collections from this program. Discussions with the federal government are also continuing with regard to the records of 2 other Residential Schools programs, the Common Experience Payments (CEP) and the Independent Assessment Process (IAP). Finally the Commission is conducting research into the extent to which records held by Library and Archives Canada are not currently represented in the Collection.

12. Challenges for the National Research Centre (NRC)

To assist the archivists in the future NRC the TRC archivists are compiling a detailed policy and procedures manual in addition to the Statement Gathering Manual and the Protocols and technical reports that the Bronson Consulting Group have developed and submitted. In addition all of the current research into trusted digital repositories will be essential to ensuring that embedded technical specifications can be used to support data migration. A robust privacy regime with specialist assistance will be essential to ensuring that the rights and responsibilities of the donors including statement providers and the contributing archives and government departments are maintained. It will be essential to ensure appropriate culture respect during research special rooms for ceremony and reflection. The archives of the Museum of the American Indian provides a model.¹³ Finally, the logistical challenges that the TRC has faced will continue as the Centre works with local and regional communities to provide educational resources and access to this unique memorial collection.

National Strategies as the Foundation of Togetherness

National Planning as the Key for Successful Implementation of Digitization Strategies

Andris Vilks and Uldis Zariņš

The National Library of Latvia, andris.vilks@lnb.lv

Abstract

Digitising Latvian cultural heritage and making it publicly available is one the most important tasks for all Latvian cultural and memory institutions. Unfortunately, there are some legislation problems that cause lack of coordination and joint methodology in the digitization field. The National Library of Latvia has taken part in development of a state “Digital cultural heritage” working plan that foresees establishing of the digitization competence centre. Effectiveness of cooperation and sharing of best practices was approved by experience of many European countries. It helps not only to reduce costs and save resources, but also facilitates development of all cooperation partners.

Authors

Andris Vilks is one of the most prominent specialists of the library and information sciences. He has contributed significantly to the development of the library sector and advancement of information and knowledge society in Latvia and the Baltic States. Born in 1957 in Riga, graduated the Doctoral program of the Library and Information Sciences at the University of Latvia. Since year 1978 he works in the National Library of Latvia (NLL) and since year 1989 he is the Director of the National Library of Latvia. Since 1989 Andris Vilks has ardently and tirelessly advanced the project of the National Library of Latvia “The Castle of Light”, which includes the construction of the new building of the library, development of the country wide library network and establishment of the National Digital Library. Mr. Vilks holds different positions in national and international organizations. Andris Vilks is Chancellor of Latvian State Decorations Chapter, the Treasurer and the Member of Executive Committee of the Conference of European National Librarians (CENL), the Member of International Committee of Experts of UNESCO Memory of the World Register (1992 – 2007, 2009 – present), the Member of the Executive Committee of Latvian National Commission for UNESCO, President of Latvian National Commission for UNESCO (2008 – 2010) and since 2001 Chairperson of Latvian National Commission for UNESCO Communication and Information Programme.

Uldis Zariņš is Head of Strategic Development.

*“Member States should improve how they preserve digital material for the long-term.
Otherwise our collective memory will be lost for future generations.”*

-- Neelie Kroes

Vice-President of the European Commission responsible for the Digital Agenda

Many institutions involved in national cultural heritage digitization have realised that they do not have enough financial and human resources to succeed, so they have started to cooperate with other institutions.

Indeed, cooperation on preservation infrastructures, use of open-source software and sharing of best practices have proved very efficient for cost and resource saving, as well as for helping organizations to move forward more swiftly. Cooperation has also flourished on an international level. Such successful initiatives are “Europeana” and “World Digital Library” (WDL). However, there is a cooperation level

where surprisingly often is not enough collaboration—the national level. Of course there are some exceptions. An excellent example of collaboration on a national scale is the National Digital Library of Finland, when libraries, archives and museums have joined their resources to achieve common goals. In spite of that, more common practice is inter-branch cooperation.

Digitising Latvian cultural heritage and making it publicly available in the digital environment currently is one the most important tasks for all Latvian cultural and memory institutions. This objective helps to update cultural institutions' workflows and offer quality services to target groups, which primary use digital media for information search and retrieval, as well as for communication processes. At the same time such improvements ensure cultural heritage long-term preservation for future generations.

The importance of digitising Latvian cultural heritage and making it publicly available in the digital environment is mentioned in the Republic of Latvia long-term strategic planning documents ("National Culture Policy Guidelines 2006-2015. National State" and "Latvian National Development Plan 2007-2013," as well as outlined in the 2014-2020 Plan). In 2006 for the implementation of the digitization assignments a long-term government programme "Latvian National Digital Library "Letonica"" was started. Starting with the 2006 for the development of "Letonica" financial resources from the state budget sub-programme "National United Library Information System" are allocated. The most significant accomplishment of this programme is the establishment of the Digital Object Management System (DOM) that was started in 2007 and finished in 2009. At the same time when DOM technical infrastructure was being built, within the framework of this programme, digitization of the National Library of Latvia (NLL) collections was done and digitization methodology base was developed. Since 2009 NLL has found the opportunity to continue the digital library development process by implementing two European Regional Development Fund financed projects and a chain of small-scale projects sponsored by foreign financial instruments.

At the beginning of the programme implementation process, it was planned that project outcomes (technological and methodological base) will be used not only by NLL, but also by other libraries, archives and museums. In reality, apart from the advanced NLL digital library platform many information systems that are partly connected with completing digitization tasks were developed. For example, digital object storage and display functionality of the "Joint Catalogue of the National Holdings of Museums" and "State Unified Information System for Archives," digital object search functionality of the "Cultural Portal," purchase of digitized data storage and management system for archives and museums, development of digitization methodology for archives, etc. These products were developed without taking into account what NLL had accomplished during the National Digital Library development process. As a result of memory institutions stand-alone activities, incompatible and even duplicate information systems were established. Implemented technical solutions and projects of archives and museums are at odds with not only NLL digitization methodology, but also international standards.

The main reason for such lack of uniformity is that no institution in Latvia has a formal mandate that delegates the functions of creating and maintaining a national scale digital library. As a result of legislation problems, digitization activities are being done within certain institutions and domains, without coordination, broader view of governmental digitization objectives, joint methodology and standards, and without noticing achievements of related institutions. The NLL has considered such use of state and European Union (EU) resources unsuitable, and suggested that the Ministry of Culture start digitization coordination process.

Further development of digital process coordination on a national level is extremely important, because publicly available information indicates that digitization and digital availability will also be

among the European Commission (EC) priorities for the next financial planning period. The European Digital Library “Europeana” sustainable development is one of the aims of the EC programme “Digital Agenda for Europe.” EC report “Europeana – next steps” and EC established “Comité des Sages” (Reflection Group) report “The New Renaissance” emphasizes that EC must continue financing the maintenance of “Europeana”, while the creation of the digital content expected to be done by member states, especially encouraging to realise digitization projects with public-private partnership support or using the structural funds resources.

The NLL has decided that the most effective way to achieve maximum rationality and effective use of resources is by initiating National digital resource aggregator development, which would be based on the previous projects outcomes, first of all, on the “Latvian National Digital Library “Letonica”” programme. This initiative could unite competences and resources of the leading Latvian cultural and memory institutions. The NLL is ready to undertake the task of establishing and coordinating the aggregator development, because NLL has the most significant experience and knowledge in the field of digitization in Latvia. NLL has started creating the concept of digital content aggregator that expected to be completed by the end of 2012.

NLL has been creating digital resources since 2001, when it also initiated cooperation on digitization between libraries, archives and museums. The main functions of NLL are: responsibility for information gathering, processing, storage and availability, as well as hard work on maintaining and developing technologies and human resource competencies, which allows NLL to take responsibility of establishing the united concept for aggregator functionality, developing digitization methodology, implementation of international standards, personnel training and cooperation with international organizations, including the European Digital Library “Europeana”. It should be noted that NLL created “Digitaser’s Manual” is a major digitization teaching aid in Latvia. NLL is the only institutional content aggregator for “Europeana” and WDL in Latvia. NLL took part in many successful “Europeana” digital content development projects, in close cooperation with different international organizations: Conference of European National Librarians (CENL), Conference of Directors of National Libraries (CDNL), Ligue des Bibliothèques Européennes de Recherche—Association of European Research Libraries (LIBER). The NLL staff regularly takes part in “Europeana” Council of Content Providers and Aggregators working groups, International Federation of Library Associations and Institutions (IFLA) and European Bureau of Library, Information and Documentation Associations (EBLIDA) copyright committees. The NLL professionals actively support the Ministry of Culture of the Republic of Latvia, help to prepare national position on the issues related to digitization of cultural heritage and adjust the Republic of Latvia legislation on related issues—from the legal deposit to copyrights.

At the same time NLL is ready to closely cooperate with other institutions which competencies at some areas are stronger than NLL’s ones. One of the most important digitization aspects is long-term digital content preservation that traditionally is the archives’ competence. It could not be denied that state agency “Culture Information Systems” has significant experience in building and maintaining IT infrastructure and information systems. This valuable experience could be used to maintain also a digital library infrastructure.

The NLL emphasizes that this initiative, as well as programme “Latvian National Digital Library “Letonica””, does not just mean NLL collection and electronic service development, but step-by-step memory institutions resource integration and maximum effective use of different institutions’ resources and competencies. It is the reason, why NLL have considered that it will not be right to use budget sub-programme “National United Library Information System” for digitization, building and maintenance of

digital library infrastructure. The NLL has advised to establish a new budget programme “Digital Library” that could provide financial resources not only for developing information systems, building and maintaining infrastructure, but also for providing digital services and creating digital content. Referring to positive experience from 2003 until 2005, when “Cooperation of Archives, Museums and Libraries in Digital Environment” was functioning, NLL recommends to renew this practice.

Effectiveness of nationally coordinated digitization processes was approved by experience of many European countries, especially by countries with relatively low inhabitant number. One of the best examples is Finland, where national aggregator development coordination was delegated to the National Library of Finland, but preservation tasks to the National Archives of Finland. The Ministry of Culture of the Republic of Estonia in the end of summer 2012 approved digitization development plan “The National Library of Estonia Digital Archive: Development Plan for 2011-2016.” It was figured out that the digitization processes in Estonia had not been well coordinated so far. The National Library of Estonia initiates the development of unified long-term digital storage, joint Estonian cultural heritage space, as well as strengthening mutual coordination between institutions and establishment of competence centres. 12-13 million euro were allocated to the fulfillment of these tasks during the aforementioned period of time.

The NLL has advised the Ministry of Culture of the Republic of Latvia to consider the proposal of aggregator concept and to start its implementation in 2013, and entrust concept implementation preparatory work, as well as digitization processes coordination, to NLL.

Following objectives are assigned to ensure digitization of all Latvian memory institutions cultural heritage collections:

- Developing of memory institutions collection digitization plans, considering common content selection parameters, where priority is given to the most important collections (perishing, the most demanded and rare – historically significant);
- Establishing of digitization council and competence centre network;
- Developing digitization standards and quality requirements that meet international standards;
- Electronically cataloguing information of memory institutions collections and making it publicly available (according to digitization plan);
- Digitising cultural heritage collections and making them publicly available (including films, sound and audio records, music scores and other materials, according to digitization plan);
- Developing electronic book and periodicals deposit (storage) in cooperation with publishers to ensure long-term preservation of this content;
- Digital recording of intangible cultural heritage content (performances, concerts, oral history etc., according to digitization plan).

The following objectives are assigned to ensure digitally born culture heritage acquisition and storage:

- Developing guidelines and system for acquisition and storage of digitally born and unpublished traditional form materials (e-books, e-publications, digital photos, pictures, electronic maps, video and audio recordings);
- Developing guidelines and system for acquisition and storage of wide variety non-commercial software products (different applications, games etc.);

- Developing guidelines and system for acquisition and storage of private collections materials (digitized / digitally born documents, photos, pictures, e-mail correspondence etc.);
- Developing guidelines for harvesting and storage of Latvian online resources, harvesting and preservation of Latvian web content;
- Establishing storage for digital music recordings and scores.

One of the most important objectives is digital and digitally born cultural heritage long-term preservation in the digital environment. The following activities are assigned to ensure this objective:

- Developing a plan for cultural heritage long-term preservation in the digital environment;
- Establishment of a long-term digital preservation competence centre;
- Developing digital and digitally born cultural heritage long-term preservation infrastructure and services.

Digital strategy could include the role of memory institutions as implementers of programmes such as “Language Block” (CLARIN) and linguistic intelligence technologies “Language Coast”. The following activities are done to unite participants of the language project (memory institutions):

- Automatic translation (machine translation technologies, linking up language syntax and semantics, modeling algorithms and newest statistical methods);
- Terminology management (national and international institutions terminology database integration in unified network, multilingual terminology integration to the translation environments and systems);
- Intelligent search systems (information selection according its meaning, picture analysis, search and automatic annotation technologies, video material analysis technologies, information retrieval from multilingual resources);
- Human voice technologies (voice synthesis, speech recognition and transformation into textual information, human voice recognition methodology for adaptation from large to small language groups, identification of the speaker);
- Orthography technologies (word and sentence syntax analysis, error finding and correction technologies);
- Digital library technology development (integration of technologies for processing, archiving and making available resources with huge content amount, finding solution for long-term preservation, developing interactive and multilingual e-training tools, also content development tools for mobile devices);
- Semantic information management (document and content management automatisisation based on semantic analysis).

There are some objectives that strongly require national coordination and planning:

- Planning of digitization on a national level that allows to set goals of national importance, puts digitization in a broader context, involving all cultural sector (not only the memory institutions), ensures the digital availability of the national cultural content and fosters its broad reuse in the education and creative industries;

- Support of cooperation on a national level by establishing content priorities, implementing centralised governance and financing of digitization, by creating competence centres and fostering knowledge transfer, by developing common digitization standards and setting up a shared infrastructure, thus decreasing the digitization costs and improving quality of outcomes. According to unfinished “Digital cultural heritage working plan, 2013” a new function will be delegated to the NLL—serving as a cultural heritage digitization competence centre that coordinates national digitization processes, develops and disseminates best practices, methodological materials, digitization guidelines and standards. This working plan could be completed and approved by the Cabinet of Ministers in autumn 2012. For establishment of digitization centre at least 5 specialists will be required: metadata specialist, text digitization specialist, digital library systems specialist and project manager.
- Better support of cooperation on an international level. For example, identifying content of national interest located abroad and content of interest to other countries located in holdings of national institutions, and agreeing on cooperation in digitization of this content;
- Support by tackling the issues of political and legal nature. For example, by adjusting the copyright framework, legislation on privacy rights and public sector information digitization;
- Planning of adequate financial and human resources for cultural institutions. Too often cultural institutions are obligated to do more and more, including digitization, without increasing available resources. This also includes development of human resource competencies, because digitization requires additional skills from the cultural institutions personnel;
- Increasing awareness of digitization importance. Too often politicians, staff of cultural institutions, creative industries and wider public do not understand why it is beneficial for all to put the culture in the digital environment.

Lately there have been several calls to different states of the world to increase their efforts on digitising their cultural heritage and making this content available online. The “IFLA Manifesto for Digital Libraries,” endorsed by UNESCO, addresses national governments to recognise the strategic importance of digital libraries and asks to actively support their development by providing necessary legislation and financial support. Manifesto recognises national e-strategies as a firm basis for planning digital libraries. EC recommendation and European Council conclusions on digitization and online accessibility of cultural material and digital preservation provide some very clear guidelines for EU member states, highlighting that in order to fully develop the potential of “Europeana” it is necessary to create synergies between national efforts.

European Council asks its member states to consolidate national strategies and targets for the digitization of cultural content, to consolidate organizations and funding of the digitization, to develop qualitative standards for it, to set up or reinforce national aggregators of digital cultural content, to reinforce the use of common digitization standards and the systematic use of permanent identifiers, to ensure the wide and free availability and reuse of existing metadata produced by cultural institutions, to reinforce national strategies for long-term digital preservation, to make all necessary legal arrangements for the legal deposit of digitally born content in order to guarantee its long-term preservation.

These are some very powerful statements, and hopefully governments of the world are finally taking notice.

Preserving the Crowdsourced Memories of a Nation

The Singapore Memory Project

Ivan Chew¹ & Haliza Jailan²

¹Assistant Director, National Library Arts & Singapore Memory Project, National Library Board Singapore

²Haliza Jailani, Assistant Director, Metadata Services, National Library Board Singapore

Abstract

The Singapore Memory Project (SMP) is a national initiative started in 2011 to collect, preserve and provide access to Singapore's knowledge materials, so as to tell the Singapore Story. The paper will share the approaches, considerations and challenges in collecting memory items and multiple agencies, including open submissions from individual members of the public. The paper will also cover how social media engagement for the project has been adapted as part of the collection process—particularly Facebook, Twitter, and Blogs—and the resulting challenges for digital preservation. Finally, the paper presents the on-going efforts in refining the SMP's digital preservation policies and implementation.

Authors

Ivan has been with the National Library Board since 1996. His current portfolio includes the development of web portals, apps and web services to support national initiatives like the Singapore Memory Project. Since discovering blogs and social media in 2004, he has been actively blogging and has helped develop blogs for the National Library Board, Singapore. Ivan has an MSc (Information Studies) from Nanyang Technology University, Singapore, and a 1st Class honours degree from the University of London in Information Systems and Management.

Haliza is responsible for the implementation of metadata for purposes of resource discovery and digital preservation. Previously Programme Manager for NLB's Digital Infrastructure programme which delivered the Digital Preservation System, she had subsequently operationalised the digital preservation processes for NLB's digital collections. She received her MSc from the University of Central England, focusing on metadata studies.

1. Introduction

The Singapore Memory Project (SMP) is a national initiative started in 2011 to collect, preserve and provide access to Singapore's knowledge materials, so as to tell the Singapore Story. It is interested in building a national collection of content in diverse formats (including print, audio and video), to preserve them in digital form, and make them available for discovery and research. The outcome is to be a look-back at Singapore's development, particularly from the views of ordinary individuals, in the form of memories and shared experiences of the nation.

Singapore is a city-state, with a total population of over 5.18 million.¹ It is a relatively young nation, having gained Independence only less than 50 years ago. In recent years, there has been a growing

¹ "Statistics Singapore - Key Annual Indicators," Department of Statistics Singapore, accessed August 27, 2012, <http://www.singstat.gov.sg/stats/keyind.html#keyind>.

awareness on the need to remember where Singapore came from, and how it got to its current stage of development.²

The SMP aims to collect 5 million personal memories as well as a substantial number of published materials on Singapore by 2015. It will do so not only through its own efforts but also via partners and agencies embarking on similar collection drives. It is interested in recollections not just from individuals, but also organisations, associations, companies and groups.

There are also multiple agencies involved, from government, non-government and private-sector organisations. Some of the memory collection drives include schools with the Ministry of Education, working with Non-government organisations like the National Council of Social Service (NCSS) and National Volunteer & Philanthropy Centre. Other government partnerships partner campaigns relating to Defence and National Service, various ministries. Private-sector companies have also been involved, such as banks and home-grown brands.

Overseas Singaporeans and non-citizens are welcome to participate in this project. Citizenship is not a prerequisite for participation. Singapore's memories also include those of tourists, Permanent Residents, students, business people and various travellers who pass by each year.

Since its August 2011 launch, the SMP has collected close to 300,000 personal memories³ and 120 partnerships forged with agencies from the public and private sectors, academic institutions, schools, organisations, clans and communities, as well as niche clubs and interest groups.

2. The Role of the National Library in a Memory Project

The SMP is facilitated by the National Library Board, in partnership with other institutions such as local and overseas libraries, heritage agencies and research institutions. It is led by a steering committee comprising 13 members from academia, media, content owners, community and agencies involved in heritage and national education. These members were chosen to provide a wide representation from various sectors.

The National Library of Singapore, managed by the National Library Board, is the repository of Singapore's publishing heritage. The NLB has garnered positive goodwill and built a credible image over the last decade in transforming the public and national library system in Singapore. It also has extensive partnerships with various government and private-sector organisations.

The genesis of the SMP began as a National Library project to digitize heritage content and materials. It was subsequently positioned and successfully endorsed as a nation-wide memory initiative. A memory project of such a scale would require capabilities in developing skills and systems to collect, process, organise and make publicly available materials. These are traditionally the skill-sets of a library. Under its Library 2010 plan, NLB had put in place an extensive digitisation effort to transit Singapore content from the physical to the digital.

3. How memories are collected and how content collection has been shaped

The Merriam-Webster dictionary defines “crowdsourcing” as “the practice of obtaining needed services, ideas, or content by soliciting contributions from a large group of people and especially from the online community rather than from traditional employees or suppliers.” The SMP could be seen as crowdsourced project on a national scale. Both traditional and mainstream channels have their roles as collection channels. Digital and social media channels play an important role too.

The public call for contribution of digital and physical items has been through the following:

- Advertisements/advertorials in print, broadcast and online media
- Social media platforms
- Outdoor publicity, distribution of posters and flyers
- Exhibitions and roadshows at community and residential areas, libraries, schools and partner agencies

The project involves a wide variety of partners and individuals, each with differing skill sets in area of recording, documenting and so on. A large part of the SMP work has been in actively cultivating grassroots communities and volunteers, and to equip people with the skills to conduct interviews and collect memories.

At the social media front, different content posted at the respective social media platforms call for unique approaches and treatment for the acquisition/ collection, organising, storage, preservation, search and display.

Formats collected so far include handwritten notes, personal photographs, physical objects, illustrations, and written expressions in digital and non-digital formats. The presentation, and consequently preservation, is ultimately in a digital form.

The criteria to the types of items that form part of Singapore’s memory have been deliberately broad. The SMP is interested in stories and memories that relate to Singapore, be it past or present memories, in physical or digital format. These may come in the form of photographs, letters, ephemeral, manuscripts, videos, or oral interviews that are stories and memories that are related to Singapore.

For SMP, memories can be personal accounts that tell the Singapore Story, be it past or present memories, in physical or digital formats. The submissions need not just be on the positive or feel-good memories only. The stories could be as recent as something that happened a few minutes ago. What is present now, will serve as a past memory for future generations.

Contributions from partners tend to be publications, many require digitization. For instance, with the Spirit of Singapore NDP engagement programme, more than 200,000 memories have been recorded in the form of reflections of Singapore on the Singapore Spirit. These were articulated entirely as hand-written postcards. They were transcribed, with the postcards scanned as digital images. The transcribed text and the images were then presented as a memory item in the portal.

The collection efforts and drives influence and ultimately have implications for the subsequent processing, organising, retrieval/ display and preservation of the memories. These influence and dictate the quality and quantity, type and form of the content, largely related to the sources, all of which continue to shape the project’s preservation policies and approaches.

4. The SMP digital & social media “eco-system”

The overall approach in SMP has been to reduce barriers to contribution. Where possible, the SMP would go to where users prefer to congregate online, rather than force them to use the portal as the sole submission channel.

The use of social media is seen as a practical reality for online interactions, sharing information, creating and consuming content. A total of 66.6% of Singapore’s resident adults have Secondary or higher qualifications and the country has a literacy rate of 96.1%.⁴ It is also a very connected city, with almost 3 in 4 owning a smartphone⁵ and over 80% of households in Singapore have home access to the Internet.⁶ In that context, it was quite natural that the SMP would have an online and social media component to it.

The current SMP digital and social media “eco-system” comprises of the flagship portal and a blog, as well as official channels on social media platforms like Facebook, Twitter, Instagram, and YouTube (these are a few of the main social media platforms). The social media channels, from their initial roles as engagement platforms, are now positioned as complementary extensions to collect memories online.

4.1 Singaporememory.SG - SMP portal

The SingaporeMemory.SG was launched in March 2012. It was envisioned that every Singaporean would have a personal digital memory account to contribute their stories. With that account, users could connect with others through shared memories.

The SMP portal was developed primarily as a way to efficiently collect crowdsourced content online, and to allow public access to all knowledge assets collected by the SMP from other sources, including institutions. It was also to be a showcase for evocative videos, photo essays, comics and other visual productions from students, artists and filmmakers. Such content was to serve as “emotive hooks” that would make the content alive. It was hoped that users would be invested to discover more, and augment and create further content.

As mentioned, the reduction of barriers to contribution was a constant consideration. The challenge was to build a portal that was on par with popular social media platforms, and still be able to obtain information and formats that would allow the content to be adequately preserved digitally.

One of the ways in which this is done was to let users log in with their existing accounts on popular platforms, like Facebook, Yahoo, and Google. Users could then proceed to contribute to the portal without having to create additional online accounts.

During the design phase, the submission fields were refined to what was considered the minimum required. Compulsory fields were also kept to a bare minimum. It was also decided to provide only one form that would allow different permutations of a memory to be submitted. Examples: Text description-only; Text description with Image/ Video; Image/ Video only.

The current online submission form comprises of the following fields:

⁴ “Statistics Singapore - Key Annual Indicators,” Department of Statistics Singapore, accessed August 27, 2012, <http://www.singstat.gov.sg/stats/keyind.html#litedu>.

⁵ “Singapore Tops Smartphone Ownership,” *AsiaOne*, accessed Jul 14, 2012, <http://news.asiaone.com/News/Latest%2BNews/Science%2Band%2BTech/Story/A1Story20120619-353711.html>.

⁶ “IDA Singapore - Publications - Infocomm Usage - Households and Individuals,” IDA Singapore, accessed August 12, 2012, <http://www.ida.gov.sg/Publications/20070822125451.aspx>.

- Title of the memory (compulsory field)
- Year (compulsory field)
- Day
- Month
- Geolocation
- Contributor
- “Memory of” (the originator of the memory; not necessarily the contributor)
- Description of the memory
- Social tags
- Attachments (images, videos)
- Terms and Conditions (a compulsory check-box)

The portal supports the submission of JPEG files (3Mb per image), as well as video files in AVI, MP4 and WMV formats (20Mb per video file). Users can submit up to five attachments per memory. With the attachments, the items would then be viewed as a composite memory.

Contributions are published in the portal immediately. The aim was to be as open as possible, relying on the community of users to help flag inappropriate contributions. Behind the scenes, the site administrators would then review published content, to ensure contributions adhere to the Terms & Conditions and remain in true spirit of the project.

It was hoped that through the SMP portal, information gaps can be addressed through the contributions of others. Over time, what the community collectively contributes should help enrich one other’s submissions.

One key premise was that each deposited memory would be linked to at least one other related memory. Contributors would then discover and connect with others who have deposited similar memories. It was hoped that such a feature in the portal would not only reinforce the relevance of adding a memory, but also sustain the rate of online contributions.

4.2 SG Memory Smartphone App

Along with the portal, an iOS app (called SG Memory) was developed and released through the Apple App Store. The app’s focus was to increase the accessibility of the SMP online submission channel. Stories with accompanying images and videos, with geolocation information, could be submitted to the portal on a mobile device. The app also provides a visual way of interacting and viewing memories based on one’s location.

The app captured the same fields as the portal submission form. Submitted memories are directly stored into the same Content Management System, they way they would have been as if the user had used the web portal.

The app was part of the SMP’s positioning that memories could also be “captured as they happen.” In part, it was to address the misconception that the memories only happened in the distant past. By allowing a more immediate means of submission, relatively recent ‘memories’ and experiences could be submitted.

4.3 Twitter.com

The SMP initially adopted the Twitter platform as a means to engage Twitter users. Specifically, the Twitter hashtag #SGmemory was created as a way to uniquely identify tweets that were related to the SMP.

Twitter is known as a “microblogging” platform. Each “tweet” is limited to 140 characters. Accompanying images and geolocation could be attached with the tweet. In March 2012, the SMP experimented with a Twitter campaign, which resulted in the #SGmemory hashtag trending on Twitter over three days, generating more than one million impressions and over 10,000 tweets with #sgmemory hashtag. It became clear that memories could also be expressed as individual tweets. Twitter seemed to be an exceptionally spontaneous channel to generate shared memories.

As a result of the successful campaign, there was a modest steady stream of tweets with the use of the #SGmemory hashtag. This effectively identified tweets as relevant memories for SMP. However, collecting tweets and displaying them required a different approach other than direct online harvesting. The primary consideration was to adhere to Twitter’s Terms of Service and their API rules.

The SMP is currently evaluating options on ways to collect, organise, display and eventually provide access to relevant Tweets. Some of the ways include leveraging on Twitter APIs, or third-party tools, to retrieve and export tweets. Operationalising this would require adherence to the platform’s Terms of use. For instance, Twitter’s Terms of Service states that users retain their rights to any content they post or display on or through their service.⁷ In Twitter’s API terms, developers can use the Twitter APIs to “export or extract non-programmatic, GUI-driven Twitter Content as a PDF or spreadsheet by using “save as” or similar functionality. However, Tweets cannot be exported to a cloud-based service. Developers cannot “sell, rent, lease, sublicense, redistribute, or syndicate access to the Twitter API or Twitter Content to any third party without prior written approval from Twitter.”⁸

4.4 Facebook.com

Facebook is arguably one of the most dominant social media platforms in Singapore. There was an estimated 2.7 million Facebook users in Singapore, or a 76.18% penetration rate of online population.⁹ There are a few popular and active Singapore heritage-related Facebook pages like “On A Little Street In Singapore”, “Heritage Singapore Food”, “Singapore Heritage, Monuments and Places of Interest”, and “Heritage Singapore - Bukit Brown Cemetery”. There are also various school Alumni pages, estimated to number the hundreds.

As with Twitter, Facebook has its own terms of use and API rules. At the writing of this paper, the SMP is developing a Facebook app that will serve as an online submission form. It was very important that the SMP satisfy all legal requirements of the collection process via Facebook.

The app would interface with the SMP content management system, through existing web services as well as within the stated Facebook developer terms of use. The app would function as an online submission form within the Facebook environment. At the same time, the app would acts as a digital pipeline, transferring the same content to the SMP portal for display. Memories that are posted through the app would be deposited and stored directly into the SMP Content Management System.

⁹ “Singapore Facebook Statistics, Penetration, Demography - Socialbakers,” SocialBakers, accessed August 22, 2012, <http://www.socialbakers.com/facebook-statistics/singapore>.

4.5 Blogs

There are no definitive published statistics on the total number of Singaporean bloggers. A search for Google-hosted blogs (i.e., Blogspot.sg) that originate from Singapore show about 20.4 million results.

From a content collection perspective, blog posts are no different from digital images or any digital memory object, in that they exist in a tangible expressed form. Many blog posts take the form of personal diaries and memoirs. Collecting them would require the same considerations as collecting memory content from individuals or partners, where owners of the content are contacted and their explicit permissions sought.

The primary challenge for the SMP was to identify—on a large scale—blogs and blog posts relevant to the project, and to be able to contact and obtain permissions from the content owners. At the time of this article, the SMP is looking at solutions that include commissioning a online data-mining service combined with a Business Process Outsourcing contractor. The former would identify relevant online content, while the latter would handle the process of contacting blog owners.

Another aspect is the presentation and enabling users to make sense of the collected blogs, with the other memories submitted from various channels. The blogs themselves are the best way to present the context of both the blogger's original expression of intent, as well as make the most sense for readers. Unlike a digital image that has not been uploaded online, blog posts are already publicly available. The approach that SMP has adopted is not to make copies of them by default, but to have the blog owners pledge the posts. Each post, which might be augmented with images and videos, is treated as a composite memory as if submitted through the portal. Instead of displaying the individual blog post in the portal, a link is provided so that users are directed to the blog. The blog posts are counted as memory contributions.

As blog posts are pledged and collected, each blog or blog posts will be reviewed with the purpose of digital preservation. For this, the NLB already has the technology and process for web archiving.

5. The SMP Digital Preservation Plan

Digital preservation involves the processes and operations of ensuring the technical and intellectual survival of digital objects through time. Through the legal deposit law, every Singapore publisher must deposit copies of every publication published in the Republic with the NLB.¹⁰ The NLB has undertaken the task of preserving Singapore's published heritage as part of its responsibility. A review conducted by the Board in 2005 had recommended the building of infrastructure and a centralised database for the preservation and access of Legal Deposit materials and the wider ambit of national heritage materials.¹¹ To this end, the Digital Preservation System was implemented. The NLB is the second national library to implement the Rosetta system by Ex Libris, after the National Library of New Zealand.

Being memories of the nation and directly related to Singapore's heritage, NLB will include selected material from the SMP collection for long-term digital preservation. This becomes necessary over the long-term given that the digital form can be easily changed as time passes, through changes in format, technology

¹⁰ "National Library Board Act," National Library Board Singapore, accessed July 14, 2012, http://www.nlb.gov.sg/Corporate.portal?_nfpb=true&_pageLabel=Corporate_portal_page_aboutnlb&node=corporate%2FAbout+NLB%2FNLB+Act&corpCareerNLBParam=NLB+Act.

¹¹ Chow, Lily and Lim Siew Kim. "The Legal Deposit in Singapore," *CDNLAO Newsletter* 56(July 2006), Special topic: legal deposit system, accessed August 22, 2012, <http://www.ndl.go.jp/en/cdnlaol/newsletter/056/564.html>.

or changes in needs and purpose. There are inherent risks to the digital form that challenge their long-term availability. A digital object also has a shorter life-span compared to a physical item.

The following are potential risks to the life of a digital object:

- Deterioration of the storage medium
- Obsolescence of the storage medium
- Deprecation of format
- Obsolescence of the software
- Obsolescence of the hardware
- Failure to document information about the digital content adequately, and

Long-term management needs The NLB digital preservation system is based on the following international preservation standards:

- Open Archival Information System Reference Model (OAIS-RM)
- PREMIS preservation metadata standard
- METS (Metadata Encoding and Transmission Standard)
- PRONOM (a technical registry for file formats)
- DROID (Digital Record Object Identification)
- JHOVE (JSTOR/Harvard Object Validation Environment)
- PLANETS preservation planning workflow

The Rosetta system enables various processes based on the OAIS reference model to be performed on a content object as it is ingested for digital preservation. This includes integrity checks such as checking the authenticity of the object through checksums for error-detection and the extraction of technical metadata about the object. This is done for validation and to capture technical characteristics of the digital object to be preserved. These information are included as part of preservation metadata. Bypassing details and their in-depth support in digital preservation, it can be said that JHOVE is used to extract technical metadata while DROID validates the file format information for the object based on data from the PRONOM technical registry.

Rosetta largely supports PREMIS preservation metadata requirements and captures these in a METS profile currently under review as a Library of Congress' METS registered profile.¹² This profile encapsulates the expression of data in the AIP for permanent storage. Compliance issues have emerged in the operationalisation of the system by NLB and these have been explored in a separate paper.¹³

Personal memories submitted by individuals and institutions are diverse and composite in nature. The aim is to digitally preserve the memories in the original context in which they were shared, to ensure the continuity of the emotions that might be evoked when someone views a memory in the social, political and cultural environment of the present.

Another consideration is to ensure that the information objects, originally collected as composites, could also be managed as individual digital items for future retrieval and curatorial work. The time span for this is indefinite and can span as much as a hundred years, provided the intellectual rights are available and so long as the technology and the opportunities are available for the preservation and re-use of the digital objects.

¹² "METS Profiles: Metadata Encoding and Transmission Standard (METS) Official Web Site," Library of Congress, accessed August 22, 2012, <http://www.loc.gov/standards/mets/mets-profiles.html>.

¹³ Haliza Jailani and Peter McKinney, "Compliance Conundrums: Implementing PREMIS at two National Libraries," *Archiving* 8(2012): 244-49.

NLB takes the approach of devolving digital content into its most basic form for digital preservation. This means a collection of objects that form an intellectual creation is captured as individual objects. It also means that each object is further broken down into its representations, files and bitstreams. This is in alignment with the PREMIS data model.¹⁴ This approach facilitates long-term preservation action as each object is technically preserved in its most native form. Such an approach reduces risks in preservation action which can be caused by complications in capturing extraneous information to do with the manifestation of the object rather than the intellectual form of the content.

For instance, composite memories comprising of descriptive text, photographs and videos will be captured as separate intellectual entities for preservation. This means they are technically validated and analysed as PDF, JPEG, AVI, MP4 or WMV depending on the type of file submitted. This makes them easier to ingest, validate and technical metadata extracted will be precise. Future preservation action can be performed well when technical information is available in a precise form and the workflows prescribed by PLANETS for preservation planning can be activated.¹⁵

However, when captured as individual objects, there is a critical need to ensure that their provenance and context as found in the memory are equally preserved. Such provenance captures the ownership or custodial history of the digital object and its relationship with the individual or institution whose memory it resides in. These are important in validating its authenticity and the interpretation of its use well into the future.

To ensure traceability for future validation, digital provenance is equally important and the system captures preservation events for each individual object in a composite memory. These include activities such as migration action from a deprecated format to a usable format including the circumstances surrounding such action and the reasons why.

In a similar way, the context surrounding the creation of the object and its relevance to the memory are captured through both descriptive (summaries and abstract) and technical information such as information about the creating application. An image scanned for online submission as a jpeg file is noted as a derivative copy and its provenance and context in the memory are captured.

When a similar image appears in another memory but in its native Tiff, both objects can be linked as representations and the memories connected to form a collective memory. The individual memory is preserved along with the provenance and relevance of the object to each memory. At the same time, they can both be preserved together to form a curatorial coherence within a context that is clear and that will make sense enough to evoke the original emotive reaction as much as possible to future generations of Singaporeans dipping into the Singapore Memory archives.

6. Practical considerations and challenges in SMP digital preservation

From the SMP experience, there tends to be a mistaken sense that what has been digitized is automatically in a “digitally preserved state.” The predominant concern with many contributors tends to be about copyright and intellectual property. The issue of how items are preserved, or whether they would be preserved at all, is often left unquestioned.

¹⁴ PREMIS Editorial Committee, “Data Dictionary Section from PREMIS Data Dictionary for Preservation Metadata, version 2.2,” (July 2012), 7.

¹⁵ “PLANETS: Home,” PLANETS, accessed August 22, 2012, <http://www.planets-project.eu>.

The need for preservation is a common requirement of SMP partners. The main difference lies in the selection approach of the materials to be preserved. For example, universities and research organizations will give importance to the research value of digital content to be preserved. Archives will generally analyse the business activity which will impact the archival value of the records for preservation. While libraries will typically assess the value of its collection that will impact its preservation based on the service to be provided and its institutional mandate.

SMP's approach has been to selectively preserve the 5 million memories that project is expected to achieve. There are pragmatic reasons for costs and resources that influence this decision. What is less clear is the cut-off point of what is an acceptable quantity likely to be preserved. A related question has to deal with the subjectivity of what is worthy of being preserved for the long-term.

For the SMP, developing a selection guideline and policy is perhaps the most challenging of all. Given that the SMP does not wish to be deterministic on what constitutes a "Singapore Narrative" too early at this stage, the selection approach would have to be closely refined.

Appraisal is the first step in assessing a digital object or a digital collection's importance for preservation. It is the process of determining whether the content has permanent archival value and is suitable for preservation. The basis of appraisal decisions may include a number of factors, including the following:

- Provenance and content
- Authenticity and reliability
- Order and completeness
- Condition and costs to preserve
- Intrinsic value

Such appraisal action takes place within NLB's larger institutional collection policies, its legal mandate and organizational objectives.

The prime consideration in identifying and selecting digital content for preservation is that the content must be about Singapore or be of interest to Singaporeans. This will result in a huge data set. There will always be limited resources to support digital preservation in the face of the amount of digital content available. To this end, the need to appraise, select and prioritise among digital content for preservation becomes imperative.

There exists a challenge in having to reconcile the non-standardised and composite materials submitted by individuals and institutions. Another level of complexity is added when such collection and coordination efforts are happening concurrently and at multiple fronts.

Tradeoffs and challenges are to be expected as the SMP progresses. Memories may not always be complete. In trying to seek a balance between web site usability (this includes benchmarking the site with popular social media platforms) and the needs of item documentation, there are inevitable compromises.

For instance, there are only three compulsory fields or actions when users submit a memory. The description and intellectual rights information are not mandatory. When submitting their memories, most users do not include details in the description box such as information about the photographer, videographer, copyright holder, license details or other descriptive contextual information which would stand the memory in good stead for future preservation.

At present, memories that have been submitted cannot be edited or removed by users. This is to ensure the integrity of the memory submitted is maintained. In practice however, several users have requested for an editing feature merely to make minor amendments to grammar, or to replace a wrongly submitted image. Technically there are solutions possible such as keeping versions of the memories

submitted, but this leads the team to question whether the system will be an over-engineered one which can lead to a higher-level of maintenance and increased costs.

The authenticity of the submitter is not necessarily verifiable. To keep the online platform as open as possible, our design adopted the social login features for popular sites like Facebook, Google, Yahoo and MSN. This was a welcome feature by users, as it meant they did not need to manage yet another user account. But being ‘open’ also meant that the same user can submit similar memories under different accounts. The overriding principle for SMP is that the core requirement of a memory would be the content itself. While the originator of the memory provides useful contextual information, the SMP would need other ways to verify the authenticity of the content.

That said, there are these guidelines for the selection of SMP content for digital preservation:

- Content with authoritative information of national significance (e.g., information from government agencies), are of historical or research value or which contain authoritative information of historical, scientific, social, political and cultural significance from other national agencies such as educational institutions and societies.
- Content which target a primarily Singaporean audience published locally or overseas.
- Content which feature Singapore, or are of interest to Singaporeans, i.e., such content may originate from other countries
- Content of events with national impact that take place in Singapore, which may be topical in nature.
- Content about prominent personalities in Singapore or content published by individuals who are authoritative and knowledgeable in their fields, whose views and works are popular in public opinion or provide a good social commentary.

It could be possible that the SMP to use the approach of crowdsourcing, where people—particularly online users—could help to directly or indirectly identify posts worthy of long-term preservation. For example, every memory item displayed could have accompanying checkboxes for users to rate: “most interesting”, “more people should read about this”, “I know others who might connect with this”, “worth preserving”, etc.

In the case of Tweets, although SMP cannot directly copy and display Tweets with the #SGmemory hashtag due to Twitter’s terms of use, selected tweets deemed significant to the collective national memory might potentially be downloaded in CSV format and preserved as dark archives. This preservation decision could be aligned with the responsibility that NLB has undertaken to preserve the memory of the nation.

Technically the CSV format is more amenable to digital preservation as it is a native form that is more open than the proprietary Twitter software. Although it will not retain the original look and feel of the Twitter posts, the data is already devolved to the level of the raw intellectual content which can be preserved easily.

Once the intellectual content has passed into public domain, it will even be a better option to keep the CSV form of the raw content as it is an open format that can be used easily in computer systems, with the possibility of feeding it to a future viewer that may be using new technology unthought-of in our current time.

On the whole, the SMP will continue to take pragmatic steps in balancing the immediate need for collecting memories and the longer term needs of digital preservation. Digital preservation policies and processes would be incrementally implemented as clarity increases with the amount of memories collected.

7. Conclusion

The goal of the Singapore Memory Project is to engage individuals, communities, groups or institutions who have formed memories and content about Singapore and would like to contribute them. This will build a culture of remembering which will nurture bonding and rootedness. It is envisioned that the project will continue so long as there are contributions from the community.

Apart from a quantifiable target, the SMP has intangible aims of getting as many people as possible taking part in the history of their family, streets, country and world. There is a larger aim of getting people from different generations talking more, sharing more and coming together more often. Ultimately, like all memory projects perhaps, the SMP aspires to be an open global archive for everyone to enjoy, learn from, use and reflect.

It is also important that people can make sense out of the memories that are (and would be) collected. The on-going challenge is also on how to collectively presenting the content collected from the portal and various social media channels.

The term “digitization” often carries with it an implied understanding, albeit inaccurately, to mean the same as “preservation for future generations.” Memory projects like the SMP would be good opportunities to educate the wider public about the concept and need for digital preservation.

Preserving our documentary heritage in digital form helps the nation to nurture a sense of belonging and national identity. By preserving these knowledge assets, libraries help to sustain their value in bridging information and promoting learning. This would enable libraries to engage new audiences, support innovation and research as well as foster sharing and learning as the nation grows.

National Libraries are arguably well-placed to provide such a shared service, in addition to being the lead agency in developing policies, guidelines, standards as well as public and stakeholder education. Future generations will be able to depend on the library to provide well-preserved digital documentation of information and knowledge as they are created, shared and built upon and events as they happened, and be able to use these valuable artefacts which would be lost otherwise.

Digital Preservation Policy of The Chamber of Deputies¹

Methodology for its development

Ernesto C. Bodê

Abstract

It's about the practical methodology used for writing the Digital Preservation Policy of the Brazilian Chamber of Deputies. The methodology uses the principles of work structuring, using macro steps to achieve the final text of the policy. In this work, we aim to derive and present the methodology in a way that might be applied by any other institution. To illustrate the use and application of the methodology, we present how the real work was done in the project. The main final products of the proposed methodology are also presented.

Author

Currently a doctoral student in information science (University of Brasilia - Brazil), with a Master's degree in Information Science (University of Brasilia - Brazil). Graduated in Archival and Library Science (University of Brasilia - Brazil). Analyst in the Centre of Documentation of the Chamber of Deputies in Brazil. Was the Project Manager for the Digital Preservation Policy of that institution.

1. Introduction

The objective of this paper is to present a practical methodology for the creation of an *Institutional Digital Preservation Policy*. This methodology was derived from our own experience in a project for the creation of a digital preservation policy in *The Chamber of Deputies* (National Congress of Brazil). First we present an overview of the methodology and the necessary stages proposed for implementing it. For each stage we present the goal and the general idea inside it. In addition, each stage contains a description of the way that effectively performed the proposed procedures. For each stage, we also present the real products produced in the *Chamber of Deputies*, i.e., reports, studies, up to the final product which is the final text of the policy. The policy that originated the execution of our work is in final form adopted by *The Chamber of Deputies*. Before discussing the methodology itself, we shortly present some concepts used throughout the paper.

2. Methodologies and Institutional Policies

Professionals will always devise ways to perform their regular work tasks. However, the pace of work and speed requirements often dictate how tasks should be performed, regardless of whether or not this is the best possible way to perform such tasks. Careful planning and the use of an adequate methodology, like the one described here, will help to mitigate this problem. Another advantage of using previously designed methods is that this will make it possible to promote further improvements in the procedures.

¹ The Brazilian Parliament is called *National Congress*. Brazil has a bicameral legislative assembly, composed by *The Chamber of Deputies* and *The Federal Senate*.

In this work, a methodology is understood as “A set of guidelines or principles that can be tailored and applied to a specific situation.”²

We are dealing here with institutional policies, i.e., a set of high level guidelines, applicable to an organization. In this article, the concept of policy is understood as follows: “*predetermined course of action established as a guide toward accepted business strategies and objectives.*”³

3. The Methodology Used

The use of previously *tested* and *approved* methodologies for the implementation of any project is always an approach that leads to better qualitative and quantitative results, e.g., reduction in the total number of hours spent in the project.

Like many institutions worldwide, *The Chamber of Deputies*,⁴ has felt the impact of the use of digital documents and technologies on their work processes. Therefore, there is a clear need for a digital preservation policy that provides greater security for the collections of digital documents. However, regarding projects aimed to assist in the implementation of policies, and more specifically, digital preservation policies, no tested practical methodologies are publicly available for use and for the development of a project like the one developed in our institution. In this scenario we had to propose and adopt a new methodology of working. Using this methodology allowed it to be tested and improved. In fact, our current knowledge on this now tested methodology has only been possible after the completion of all the stages that culminated with the official version of our *Digital Preservation Policy*.

We highlight two benefits of the use of the proposed methodological approach, besides the advantage of having already been tested with *actual available products*, that is, with a *Working Model* to guide the activities' path. First benefit: reduction in **subjectivity**. Policy texts are always elaborated by people, that is, they are products of human intellect. Hierarchical and personal differences within a team can cause some opinions to prevail over others. Also, besides the misunderstanding that may arise from this process, the views that prevail are not always the most appropriate, even if they are expressed by experts. Anyway, some degree of subjectivity will always exist, but we believe that the use of the methodology proposed here will help to mitigate this problem.

Second benefit: parallel to the problem of subjectivity is the need for theoretical **argument** for the guidelines in the policy text. Through the use of the methodology, each guideline is well-founded, and, consequently, the whole internal discussion and persuasion process tends to be smoother. Again, as it is something produced by people and as part of institutional negotiation processes, some guidelines may exist that are obtained through an institutional negotiation process rather than through the use of technical reasons. However, this problem is also expected to be mitigated. The reasons we support these two benefits will be clarified after the presentation of the methodology itself.

The methodology proposed here is not complex. It is rather an eight-stage methodological work, each one delivering an **actual product** (presented and exemplified below). The last product is the official version of the policy adopted by the institution.

² Jason Charvat, *Project management methodologies: selecting, implementing, and supporting methodologies and processes for projects* (New Jersey: John Wiley & Sons, 2003), 3.

³ Stephen B. Page, *Establishing a system of policies and procedures* (Ohio: BookMasters, 1998), 2.

⁴ <http://www2.camara.gov.br/english>.

The methodology is grounded on the **Technical Reasons** for proposing guidelines for drafting a **Digital Preservation Policy**. This reasoning shall be based on an *Initial Source* of information on *Digital Preservation* and the establishment of a *Areas* for the policy text. The *Initial Source* is the basis for the construction of the *Areas*. As soon as the *Areas* are available, the other steps of the process take place with the guidelines being drafted before the final official version is obtained and ultimately approved. Also, a step for the procedures of internal discussion and persuasion process regarding the policy text is proposed.

As part of the methodology, the adoption of consolidated technical standards is suggested, not only regarding *Digital Preservation*,⁵ but also *IT Governance*,⁶ *Repositories*⁷ and *IT Security*.⁸ In addition, previously defined technical terms must be included, and a *Glossary* of the terminology used in the policy text must be provided, which shall contain all of these technical terms. These technical words will be gradually added to the *Glossary* throughout the eight-stage process and the latter will finally be added to the final product as an *appendix*. The use of a *Glossary* of terminology based on widely known technical terms avoids lengthy discussions on the concepts used in the policy.

The search for institutional support to develop the project in the case of *The Chamber of Deputies* and the selection of the team responsible for project management up to the step of discussion with the other members is not listed here as a stage in the policy development process, though it is a key “pre-processing step.”

3.1 The Stages of the Methodology

The methodology developed and used in the elaboration of the *Digital Preservation Policy* in *The Chamber of Deputies* involves an eight-stage process:

- Original Source
- Areas
- Pre-guidelines
- Minute Drafting
- Internal Persuasion
- Official Formal Writing
- Official Approval
- Revision

3.1.1 Original Source

Overview

Each new policy to be developed includes a specific domain of technical knowledge related to the main theme addressed. In this step of the process of elaboration of the policy, the project team should collect all the technical information available on **Digital Preservation**, **Institutional Policies** and **Digital Preservation Policies** to support the project. It is desirable that at least one member of the team has expertise in *Digital Preservation*. Alternatively, support can be sought from external consultancy.

⁵ See ISO/TC 46/SC 11 Digital Records Preservation.

⁶ See ABNT NBR ISO/IEC 38500:2009.

⁷ See ISO 14721:2003.

⁸ See COBIT 4.1.

The source of this particular information can be scientific papers, institutions that developed similar projects and experts on topics of interest. *Digital Preservation Policies* already done or similar works from institutions that have already developed such projects are an excellent source of reference for the proposed activities.

How we did it

With respect to *The Chamber of Deputies*, the team has always relied on the assistance of a *Digital Preservation* expert. Thus, the necessary expertise has been naturally incorporated into the project. On the other hand, as we explained above, the specific issue of *Digital Preservation Policies* has been little explored and not much information has been made available to the public. The alternative adopted in this stage was the development of a *benchmark* for policies or similar strategies elaborated or adopted by other institutions.

After a preliminary study with technical definitions on the *basics* of digital preservation, we carried out a survey and identified thirteen policies or similar texts available in the Internet to support our *benchmarking* activities. These texts are listed in Table 1.

Table 1. References for the original source.

An analysis of each source identified in the *table 1* has been made to highlight the most important points and the standards adopted.

Products delivered

Report 1 that includes a preliminary study on concepts of digital preservation and *benchmark work* with thirteen institutions previously identified and assessed.

3.1.2 Areas

Overview

The specific knowledge on *Digital Preservation* and research on previous policies or similar strategies is aimed to enable, in the second stage of the process, the development of *Areas* for the policy text.

One key principle for the development of a methodology is decision making based on pre-established and consistent criteria. In *stage 1*, the purpose of the research on knowledge about digital preservation approaches was meeting the referred principle. The development of *Areas* for the policy text will allow the pursuit of the project based on criteria aimed to mitigate the inherent subjectivity of a work team, even in the final steps where other actors will participate in the policy refinement process.

The name and purpose of each *Area* are defined based on information provided in *stage 1*. Another advantage of the use of *Areas* is that it makes it possible to streamline working procedures so that team members are assigned different areas.

How we did it

The study of *Report 1* project led to the establishment of eight⁹ *Areas* to be contemplated in a *Digital Preservation Policy*. There is no exact match between these eight areas and the parts of the policy text. What matters here is to establish all the key elements to be contemplated.

1st Area: Aims of the policy and its establishment

It is about the purposes of the institution that elaborates this policy and clarification of the relationship between these aims or objectives with the policy currently under construction.

2nd Area: Objectives of the policy

It is about all the aims or objectives of the policy currently under construction. The following items specify guidelines for action, but the more general aims and objectives should be recorded in this part of the policy text.

3rd Area: Relationship with other policies

It is about the relationship of the text of this policy with other policies or strategies of the institution, or else with available legislation related to the objectives and actions set out in this policy. Specifically mention the standards to which the policy complies and upon which it is based.

4th Area: Scope of the policy

It is about the scope of the digital documents comprised by the policy. Non-scope can also be stated. Another possibility is to establish the priority for action in relation to the groups of digital documents within the defined scope, thus, prioritizing some digital documents over others. This is a solution to the problem of accepting a wide scope and, at the same time, prioritizing some groups of documents more relevant to the institution. When priorities for action are defined, the levels of support for some file formats are also defined. However, because of their importance, file formats should be addressed separately.

5th Area: What and how to preserve

It is about what the policy is committed to preserving in digital documents (specifying the documents) and for how long, e.g., preserving only the bit sequences, access to content and/or its relationship to the social context in which it was created. The commitments made directly affect the complexity of the

⁹ Different projects in other institutions could derive more or less than eight areas.

actions to be implemented to comply with the referred commitments. Therefore, attention should be paid to the possible scenarios before accepting a certain level of commitment.

6th Area: Cooperation with other institutions

It is about declaring that the institution cooperates or intends to cooperate with other institutions. This element needs special attention, for it is necessary to ensure that the institution really intends to establish ties with other institutions. It could also be introduced in future versions of the policy.

7th Area: Roles and responsibilities

It is about the roles and responsibilities undertaken by the different bodies and offices of the members of the organization regarding *Digital Preservation*. This element will be the product of the study of all the actions set by the policy text in its relation to the different bodies and offices of the members within the organization.

With respect to the responsibilities undertaken, pay attention to the *Open Archival Information System* (OAIS).

8th Area: Governance

For this group, perhaps more important than defining what to do and how to do it, is establishing guidelines on the periodical updating of these recommendations. For example, the establishment of an *Internal Management Committee*¹⁰ for periodically reviewing the policy text and suggesting changes to the subsequent versions of the text. The content of this element involves recommendations of specific accepted and recommended Technologies, as well as the necessary procedures, the most important items include:

1. Document and track changes made to formats, media or any other technology used during the custody of digital documents;
2. Who will evaluate the file formats recommended for use and specific applications such as still image, video or sound;
3. Who will evaluate the specific media to be used in the institution and how it will be done;
4. Define the procedures and strategies to be adopted, e.g., the migration of file formats and media;
5. Define the authorized file formats (recommended, mandatory) and where they should be used. Define also the versions of the authorized file formats.

Products delivered

Report 2 with the *Areas* of the **Digital Preservation Policy**, specifying which areas and objectives will be contemplated.

3.1.3 Pre-guidelines

Overview

In this stage, **pre-guidelines** will be introduced in each of the *Areas* previously established. The name of the *Area* and its objective are the main source for the selection of these **pre-guidelines**. We use here the

¹⁰ Another policy in *The Chamber of Deputies* created this committee. Chamber of Deputies, “Digital Preservation Policy,” [in Portuguese], 2012, <http://www2.camara.gov.br/login/int/atomes/2012/atodamesa-48-16-julho-2012-773828-norma-cd.html>.

term “pre-guidelines”, because this stage is not aimed to create the definitive version of the guidelines of the policy. Our concern here is to insert in the policy all the important guidelines related to each *Area*. The adequate **elaboration** and **drafting** of these guidelines are further steps in the process.

One advantage of this methodological approach is that, at this point, it is possible to streamline working procedures by assigning the tasks of insertion of **pre-guidelines** according to the area of the team member. Thus, there may be focus of some members on specific areas, increasing the possibility of detection of all the **pre-guidelines** necessary for the institution considered.

All possible **pre-guidelines** should be introduced in this step. The refinement process, that is, the possible removal of unnecessary or redundant **pre-guidelines** (relative to other areas of the framework) will take place in subsequent steps.

What is the source for the insertion of these **pre-guidelines**? As already mentioned, the first source is the objective of the area where it is being inserted. Other sources should be sought by the team members responsible for populating the respective area, such as papers¹¹ on digital preservation, policies or similar strategies from other institutions.¹²

How we did it

Tasks were assigned to team members for different *Areas*. Proposals of pre-guidelines related to the objectives of a given area were made.

Below is an illustrative example of proposal made for 3th Area (*Relationship with other policies*):

3.1

This policy attempts to meet the Brazilian standard 15.472 of April 09, 2007 in its reference model for an open archival information system (OAIS).

Rationale for this pre-guideline development

One major assumption in the policy development process was the use of standards, especially the OAIS standard, which establishes the information model and the minimum responsibilities that should be taken on to achieve successful digital preservation.

Products delivered

Report 3, which includes the first proposal of **pre-guidelines** by *Area* of the policy.

3.1.4 Drafting

This process step is aimed to transforming the content of the pre-guidelines, which has been previously proposed and defined, into a clearer and direct text.¹³ In this step, besides the use of the vernacular, another concern is the arrangement of the guidelines in hierarchical order, that is, more comprehensive guidelines should precede less comprehensive guidelines. It is necessary to eliminate redundancies

¹¹ Neil Beagrie, Najla Semple, Peter Williams, and Richard Wright, “Digital Preservation Policies Study,” Part 1: Final Report October 2008, Prepared by Charles Beagrie, Ltd., Funded by JISC, http://www.jisc.ac.uk/media/documents/programmes/preservation/jiscpolicy_p1finalreport.pdf.

¹² Luciana Duranti, Jim Suderman, and Malcolm Todd, “A framework of principles for the development of policies, strategies and standards for the long-term preservation of digital records,” InterPARES 2 Project, 2008, [http://www.interpares.org/public_documents/ip2\(pub\)policy_framework_document.pdf](http://www.interpares.org/public_documents/ip2(pub)policy_framework_document.pdf).

¹³ Michael R. Overly, *e-policy How to develop computer, e-mail, and internet guidelines to protect your company and its assets* (USA: Amacon, 1999), 4.

between the different pre-guideline proposals submitted. This step also involves detailed examination of the wording of each pre-guideline to obviate doubts regarding its use.

Terminology is regarded as important throughout the entire process, but will deserve further consideration from this step on (fourth stage), which is precisely focused on drafting *guideline text*. The use of consolidated terms from standards can save a lot of time and effort regarding the best way to draft the text of guidelines.

How we did it

We read all versions submitted for each contemplated area. We began a drafting process that included several text versions. Guidelines were grouped by chapters¹⁴ to be addressed.

After several revisions, the first version, but not the final one, of one article of the policy reads as follows:

- Art. 4 The objectives of the Digital Preservation Policy of The Chamber of Deputies are:*
- I. ensure the right conditions to provide full-text access to all digital documents for the period of time specified by the institution;*
 - II. create (adopt) standards, instruments and mechanisms to ensure the permanent authenticity of digital documents;*
 - III. define the software and hardware requirements for the establishment of the institution's own digital repository to allow for digital preservation;*
 - IV. contribute to reducing information security risks;*
 - V. promote the exchange of information and experiences on digital preservation with national and international institutions, aiming at reducing the effort and cost involved in finding solutions;*
 - VI. disclose [train?] and share knowledge and best practices of digital preservation;*

Products delivered

The product delivered in this step was the first version (draft) of the **Digital Preservation Policy** of *The Chamber of Deputies*.

3.1.5 Internal persuasion

This step requires the existence of a basic text (a first version) of the **Digital Preservation Policy**. The text obtained here is not necessarily the final version of the policy, but is supposed to contain the essential proposal. After the preparation of this text, it should be checked and, if appropriate, adjusted to the needs and limits of the different bodies within the institution.¹⁵

This step is essential because different actors will contribute to the success of the policy within an institution. Thanks to the commitment and partnership of those actors, the chances of success of the final product will increase considerably. On the other hand, the actual scenario of each institution should be taken into consideration. When it comes to people, the subjectivity of each of them must not be neglected, so that situations where it may be necessary to impose the policy or overcome resistance to its implementation must be considered for each specific case. Some issues may be just a matter of lack of communication, that is, briefings and meetings to present the policy can not only clarify doubts, but also

¹⁴ These “Chapters” do not have an exact correspondence with the *Areas* proposed.

¹⁵ Notably, those bodies that will be directly affected by the text of the policy.

gain supporters of the policy. In an ideal scenario, the policy is elaborated by a team composed of people from key bodies affected by the policy. With the support of such a team, the persuasion process will be easier. However, the mere existence of such team does not necessarily mean support to the text submitted to the internal bodies.

Another reason for conducting this step is the possibility of improvement or even correction of the policy text, not only in respect to its form, but also regarding aspects not discussed during the establishment of the first guidelines.

In the internal persuasion process, the existence of the *Areas* for the policy text and its respective guidelines, including that reasons for proposing such guidelines, that is, the first steps of the process can and should be used as arguments to make clear that the proposed text is well-grounded and consistent, and is not merely a subjective proposal of the work team.

How we did it

This step was performed at *The Chamber of Deputies* in various ways. First the policy text was made available for internal public consultation, so that various bodies might be informed of it and proposes modifications to the text.

There have also been several meetings with different internal bodies of the institution to present and discuss the policy text. In our case, there has been a partnership between the body responsible for documentation and the one in charge of information technology at the institution. We set a *deadline* for the internal bodies to present their considerations and suggestions relative to the policy text, as well as for clarification meetings.

Finally, to facilitate the internal persuasion process, several documents detailing the policy architecture, that is, how it is structured, were produced. We also produced a document with comments on each article of the policy text. As a result of this process, improvements have been made to the text and new versions were produced.

Products delivered

The products delivered in this step were a new version of the *Policy Text* (with many improvements), a *Policy Text* with comments on each article and a report detailing the *Policy Architecture* (areas covered by the policy and scope of digital documents).

3.1.6 Official Formal Writing (Minute)

Depending on the institution, this step may or may not be necessary. For some institutions the policy text must follow some standard patterns, so they provide models and standards for this type of document.¹⁶

Depending on the institution, it may be recommended that the official formal writing step precedes the internal persuasion step. Still, we believe that it should take place after stage 5 because it is essentially a work of text revision when required.

At any rate, with respect to the work methodology, this step should be done separately from the drafting step, because in the latter focus should be given to content.

¹⁶ Stephen Page, *7 steps to better written policies and procedures* (Ohio: Process Improvement Publishing, 2001), 9.

How we did it

As some team members were also knowledgeable in formal writing, several aspects related to formal writing style were used. In the end there was little need for adjustments in this regard.

Products delivered

The product delivered in this step was an improved version of the *Policy Text*, in the formal writing style. This version was called *Minute*,¹⁷ to which we attached a *Glossary* with terms used in the Policy.\

3.1.7 Official Approval

As in the case of *stage 6*, this step may or not be necessary, depending on the specific institution where the work is being developed.

The final approval mentioned here indicates that the institution's top level of hierarchy is to approve the text. Such official support will be important in the subsequent steps of policy development, that is, the implementation of the procedures and actions to carry out digital preservation. In several institutions, this final approval implies the existence of an internal official standard, which will be specific to each institution considered.

How we did it

This step was performed by the directors of the centers responsible for *Documentation* and *Information Technology*. Negotiations were held at senior management level.

Products delivered

At the end of this step, the product delivered was the text of the *Digital Preservation Policy* as an *internal standard* of *The Chamber of Deputies*.¹⁸

3.1.8 Revision

It may seem odd to include a stage in the digital preservation policy after the final approval step. In fact, this stage is not part of the methodology, but was introduced here because of its importance. Institutional scenarios change, and information technology and computing issues, in particular, are in a continuous state of evolution. Both software and hardware may undergo major changes in little time.

This is not about considering whether there will be technological changes, but to monitor those changes as they occur. The success and effectiveness of the policy text depends on this monitoring and on the actions necessary to adapt the policy text to the new existing scenarios.

How we did it

There was no need so far to revise the standard, but this responsibility is foreseen in the approved official version.

Products delivered

No products delivered.

¹⁷ Here it means a version before the formal and legal one.

¹⁸ Chamber of Deputies, "Digital Preservation Policy."

4. Conclusion

In the limits of this paper we did not present an in depth detailed steps of real work done. But from the use of the practical methodology presented in this paper, we highlight some points. First of all, the use of this methodology allowed the production of a text coherent and well-reasoned. Finally, the conduct of work among team members has been rationalized, i.e., it was possible the division of tasks and consequent focus on specific points.

The work presented here is certainly not finished. We presented here a start point to be improved by others. At least, that's what we hope. It is very important to say that this work could not be possible without so many important research centers and people dedicated to study and improve this new and fascinate area, *Digital Preservation*. The few citations presented here are the ones essential to explain the methodology; many others were omitted due to the limits and format of this paper.

Finally, the main product produced by this methodology became more coherent and well-reasoned. This allows future actions of *Digital Preservation* with higher chances of success in *The Chamber of Deputies*.

Web 2.0 Products as
Documentary Digital Heritage:
Can We Access and Preserve Them?

Unprotected Memory

User-Generated Content and the Unintentional Archive

Jamie Schleser

American University, USA

Abstract

While much discussion of online archives focuses on traditional cultural heritage institutions, a phenomenal amount of original, creative cultural production in the form of user-generated content is being stored on the servers of for-profit corporations like YouTube. These unintentional archives aggregate content in the moment with no concern for preservation. The unique ecology of the corporate online space further complicates the issue of digital heritage as these sites depend on market economic factors like maximizing profitability and minimizing copyright infringement liability rather than ensuring the accessibility of these cultural products for future generations. This paper will analyse relevant policy issues as they relate to the United States specifically, to the transnational domain of both corporations and digital heritage, and to the site-specific codes of conduct that govern these unintentional archives. It will assess emergent digital preservation initiatives in order to present recommendations for future best practices.

Author

Jamie Schleser is a Ph.D. Fellow in the School of Communication at American University in Washington, D.C. Her current research focuses on assessing the impact of the Internet, social media, and mobile technologies on cultural memory, historical narrative, and individual identity. Schleser is particularly interested in the expansion of access and the participatory culture facilitated by the digitization of physical archives and the aggregation of born-digital cultural production, whether formally or informally, into omnipresent web archives.

1. Introduction

When tragedy occurs, communities respond. While much of the focus is often on rallying around those most affected by what has happened, others in the community who have not experienced a personal loss or injury can still be left searching for answers and solace. The process of documenting and digesting these events collectively through communication lies at the heart of cultural memory. In many cultures, the untimely loss of life has long been marked by the gathering of groups and the construction of tangible memorials. Memorialization might be fleeting, in the form of flowers, personal tokens, and religious iconography left at the site of a roadside accident, or relatively permanent, in the form of architectural monuments constructed to mark a significant place. As mediated communication has become the norm, physicality is no longer a prerequisite. With each new connective technology, beginning with the invention of the printing press in the 1400s and followed in the past two centuries by advent of the telephone, broadcasting tools, and the Internet, the scope and size of cultural communication has grown exponentially. While the power of interpersonal communication has not waned, the ritual of communicating through mass media formats described by James Carey has come to occupy a central role in the exchange of ideas and the creation of culture today.

In developed countries, it has become nearly impossible to conduct the business of mundane life—whether connecting with friends and family or participating in the Habermasian public sphere of political

deliberation and opinion formation—without encountering mediation. When a gunman opened fire on the campus of Virginia Tech University in Blacksburg on April 16, 2007, the world was watching. The rampage, in which the gunman killed 32 people and injured dozens more before turning his weapon on himself, was the deadliest attack on a college campus in U.S. history and news of it quickly spread through mass media, receiving coverage nationally and internationally. In the aftermath, students, staff, faculty, and alumni gathered for memorial services on the campus, holding candlelight vigils and creating informal memorials at the sites of the dormitory and classroom building where the attacks took place, but the mnemonic discourse surrounding the tragedy that had occurred there expanded far beyond the local community. Due to mediation, broader awareness breeds a broader response. Individuals without physical or personal ties to local tragedy are now not only exposed to those events, but are also able to construct and share their own personal tributes to its victims. This is particularly true when the circumstances resonate across borders, as they did in the case of Virginia Tech, which struck a raw nerve for many Americans as colleges are often assumed to be sanctuaries of learning for young adults bursting with yet unrealized promise.

Dozens of Virginia Tech memorial videos have been posted to YouTube, a content-sharing platform that allows registered users to upload unlimited material for free. One user, identified only as “auntmannys,” posted such a video within three days of the attacks accompanied by the following explanation: “though we did not know the victims, our thoughts and prayers are with their families” . Little background information about the user is provided, though the memorial is posted alongside other videos created by the same individual, including compilations of family footage and impromptu recordings of living room dance-offs and video game duels. Just over six minutes in length, the video consists of opening text providing some facts about the shooting and an appeal for unity in remembrance of those lost, followed by a montage of photos of the victims, including information about each person’s age, hometown, and role on campus. All of this is set to music reflecting the somber tone and purpose of the video. Other Virginia Tech memorial videos posted to YouTube follow a similar formula, though some focus more on particular victims and are clearly the expressions of individuals who knew them personally. While the video posted by “auntmannys” has received over 1,300 views, a fairly large audience for something created by a pseudonymous nonprofessional who has admittedly little personal relationship to the event other than generalized empathy in the face of human suffering, comparable projects have been viewed by upwards of 40,000 or even 100,000 visitors. This digital form of memorialization, embodied in the content created and broadcast by a distant individual user using a popular corporate content-sharing platform, represents a unique and unprecedented mediated form of cultural memory. If properly preserved, these videos will document a new dimension of cultural response to tragedy that arose after the turn of the millennium, supplementing the often impersonal record of news coverage and official reports, just as material artistic expression and archived personal correspondence have marked this process in the past.

While the remnants of tangible memorials are assumed public and are often cared for by traditional cultural heritage institutions, including museums, libraries, archives, and universities, this new aspect of mnemonic discourse is taking place on private platforms like YouTube, Vimeo, Photobucket, and Flickr. In this corporate domain, cultural communication is bound by site policies that determine what materials are transmitted freely, what speech is censored, what ownership rights individuals maintain when posting user-generated content, and what happens to content once posted. The nature of governance is determined exclusively by the organization providing the service and conveyed to users via jargon-dense Terms of Service (TOS) agreements under the default assumption that participation equals consent. At the same

time, the growing significance of user-generated content aggregated on these platforms—like the memorial video created by “auntmannys”—as a record of cultural memory has yet to be embraced fully by archivists and historians and is even further from the minds of the general public and the owners of these commercial enterprises. While historical practice and cultural scholarship depend on the ability to reference collected artefacts, born-digital modes of communication have magnified both the amount of material potentially in need of archiving and the challenge of fixing those materials for preservation due to their ephemeral and evolving nature. Failing to embrace the rich stores of born-digital cultural production located within these unintentional archival spaces, where material is collected without curation or the intent of preservation and located outside the conventional domain of traditional cultural heritage institutions, could prevent future generations from being able to accurately reflect on everyday life as we know it now. Without a clear understanding of the impact of the privatization of the public sphere as a result of the dominance of these corporatized platforms, there is potential to create an unprecedented dark age of digital cultural memory.

With the goal of drawing attention to the existence of unintentional archives of important cultural artefacts on content-sharing platforms and developing strategies for ensuring the preservation of these resources, I will begin by sketching a broad understanding of digital archival practice and the particular impact of born-digital communication formats. While the most obvious challenge for digital archiving initiatives is the quantity and instability of the material to be preserved, these projects are also affected by changes in how we communicate. As cultural production and archival practice move online, I will discuss how the ecology of the Internet as a space where traditional nation-state borders are less restrictive to the flow of information has resulted in the addition of a globalized mnemonic discourse that must now be negotiated alongside local, regional, and national narratives of the past. Next, I will explore how the movement of personal expression to digital formats controlled by transnational corporations has fundamentally altered the process of archiving cultural memory by subjugating Constitutional directives encouraging the free exchange of ideas for the higher purpose of nurturing public discourse to localized codes of conduct driven by commercial imperatives. As it one of the most dominant U.S.-based transnational content-sharing platforms where an unintentional archive of user-generated cultural production has formed, I will use YouTube as a case study to identify relevant U.S. government policies that influence the business model of these services. I will also examine the body of self-issued laws governing this private platform, the TOS agreement, to highlight consequences of this shift in power from governments to corporations. Finally, I will analyse three experimental strategies currently being used to stimulate the archival preservation of born-digital cultural production in order to make recommendations for future best practices.

2. Digital Archives and Global Memory: A New Paradigm

While archival practice is increasingly turning toward digital formats, there are two distinct approaches being used today. The first, undertaken primarily by traditional cultural heritage institutions, has to do with creating digital copies of existing physical artefacts with the goal of either retaining damaged items that have become impossible to maintain in their original format or expanding access to particular collections for those unable to invest the time and resources necessary to travel to the museum, archive, library, or university that houses them. The second set of initiatives focuses on capturing the wealth of born-digital cultural production now possible thanks to advances in computing and Internet Communication Technologies (ICT) during the last forty years. As everything from broadcast television

to interpersonal communication has moved from analogue to digital, methods for capturing and preserving those materials must constantly play catch-up. The magnitude of digital communications can be explained by the compression of the time and cost necessary to distribute them. Emails convey correspondence instantly and without additional cost for individuals with high-speed Internet access where letters once took weeks to travel to their destination and required postage to get them there. Legacy news outlets can reach hundreds of thousands of readers, often through a single article, where entire newspapers previously had to be printed and delivered to individuals who subscribed or sought them out on street corners. Similarly, the accelerated evolution of ICT has resulted in a constant flow of buzzworthy projects, each one holding the title of “next big thing,” as Napster, MySpace, or the original Friendster (now attempting to reinvent itself as a gaming social network) all did, before being surpassed by something newer and more exciting. The logistical problems stemming from data quantity and the persistent cycle of technological obsolescence are the biggest obstacle to developing a feasible preservation strategy for born-digital cultural production.

The problem of scale is fundamental, as Mike Featherstone has argued that digitization requires that the very nature of the archive be reimagined as a monolith database rather than the ordered physical space of the past. As born-digital cultural production and Internet-based archival practice take hold, there is real danger of being swept up in utopian visions of cataloguing everything and providing universal access. This impulse must be balanced by a rational assessment of the instability of the online archive. The unfixed nature of technological advancement, dependent as it is on in-process decision-making by Internet architects, network designers, platform creators, and policymakers, leaves potential sources of enriching cultural artefacts exposed to constant threat from loss due to server instability, mistranslation, format obsolescence, restrictions on copying, or simple failure to recognize for preservation. As quickly as archival methods are developed, new obstacles arise. While web crawlers have proven indispensable for capturing and preserving sites on the Internet, they are plagued by changes to coding languages used to create websites that render them less effective, challenged by the spread of Flash technology that they cannot currently capture, and purposely undermined by site creators using robots.txt files to block access. There are also practical challenges, including managing the cost of server space, figuring out how to avoid preserving redundant items given the ease of digital copying, and designing user-friendly interfaces to make material accessible once it has been captured.

While digitization efforts enjoy the relative security of being mere duplications of physical objects like parchment and celluloid that have an established institutional tradition of being recognized as endangered and protected by a working set of preservation practices, born-digital materials are far more imperiled by unformed digital heritage policy. The former may expand democratic access to archival resources by effectively removing them from their physical context, but the latter are quickly become the sole record of how individuals, companies, and governments communicate. In addition to the most obvious traditional resources that warrant archiving in their new digital formats, such as news footage, journalism products, television shows, and popular music, there is a vast world of new cultural artefacts being generated through the interactive and participatory culture of Media 2.0 in the form of original creative works, recorded testimonies, personal photography, comments, reviews, and more that are being shared by individual users with wider audiences than ever conceivable even a decade ago.

Though capturing, preserving, and providing access to these new categories of artefacts remains paramount, it is also important to understand the theoretical underpinnings of these projects. The advent of ICT and the networked society imagined by Manuel Castells have forced scholars of media and memory to adjust their ideation of how digital communication and mnemonic practice shape

contemporary cultures. Growing expectations among users that their experiences with media today will prominently feature interactive elements and opportunities to contribute to a larger public discourse are just some of the changes that underwrite the transition to what Andrew Hoskins calls the “new memory ecology.” As a result of the shift to a post-broadcast understanding of how the past is mediated, which defies the simplistic delineation between producers and audiences, he argues that there is now “a greater mixing of the personal and the public, and a routine meshing of the witnesses to events (including those seen as perpetrators and victims) and archives comprising data of these and other events deemed connected” . As media and memory are intertwined, the flexible and evolving nature of digital communication is mirrored in the recent scholarly reimagining of cultural memory as similarly unfixed. Media memory is now best conceived as a process of negotiation between various competing narratives, both in the immediate aftermath of significant events and over time as they are constantly revisited and re-evaluated through the lens of newly possible unbroken access to archives online. Moving forward, it is likely that the same challenge to the traditional authority of media producers of the broadcast age posed by the advent of digital technologies will be paralleled in institutional archival practice thanks to the ability of those same technologies to enable non-professionals to curate some aspects of cultural production, whether intentionally or unintentionally.

While Jack Goldsmith and Tim Wu have used the example of the Principality of Sealand to illustrate that the Internet is not the Wild West free-for-all that some early adopters dreamed about, where nation-states watch helplessly without the ability to regulate transnational commerce originating outside their borders, the capacity of ICT to facilitate the flow of information beyond the traditional boundaries of physical proximity that once limited human interaction has also reshaped how we must think about cultural memory. Anna Reading termed this new digitalized mnemonic terrain the “global memory field,” a place where competing narratives of the past move across physical borders, negotiate around obstacles (like localized censorship), travel faster, resonate more often, flow across mediums more freely, and evolve differently over time than they did in the pre-ICT world. In effect, the cultivation of cultural memory now takes place in the context of digital networks that press remembrances tied to personal experience, as well as those anchored in local, regional, national, and international identities, against one another in a way that causes the echo of the others to gradually reshape each one over time. As an example, consider the difference between the Japanese bombing of Pearl Harbor in 1941 and the terrorist attacks of September 11, 2001. When the earlier event occurred, news of it certainly travelled far and wide, but there was little opportunity for individual citizens to share their reactions with others living across the country, let alone abroad, unless they knew someone personally that they could write to or call (and could afford the long-distance charges).

In contrast, the events of September 11th occurred at a time when those interactions were becoming increasingly common. While the swirl of patriotism around the narrative of “a nation under attack” went largely uncontested for Americans at home during World War II, a similar reaction sixty years later has been tempered by exposure to conflicting interpretations of events coming from those living outside the U.S. A brilliant illustration of the potential impact of the global memory field can be seen in a digital exhibit titled *Where Were You on Sept. 11, 2001?*, an interactive map housed on *The New York Times* website . Users were encouraged to answer the title question in their comments and select a corresponding emotion. Each response was then illustrated as a single dot on a world map. Though responses were most concentrated within the U.S., there is significant comment activity across the rest of North America, Latin America, and Europe, as well as in India. The digital “voices” reflect a full spectrum of possible reactions, including displeasure with the American government’s response, identification with the tragedy

despite not being involved, and personal remembrances, that defy their location on the map. The global impact of 9/11 and the desire of individuals all over the world to participate in the memorialization process is similarly evident in online archives that have collected materials specific to those events, including a collection of digital art at 911digitalarchive.org submitted by users. One example features an assemblage of a personal poem layered over a photo of the New York skyline before the World Trade Center was attacked created by “an Englishman in Saudi Arabia” who wished to pay tribute to those who lost their lives . Another, submitted by a Canadian woman, combines American symbols with the maple leaf icon in tribute . These shifts in user expectations, traditional archival authority, and the scope of mnemonic discourse set the stage for examining the particular ecology of unintentional archives and troubleshooting the consequences of the privatization of communicative cultural heritage.

3. Communication, Inc.: Corporate Spaces and Cultural Production

Recent technological developments have resulted in the privatization of large swaths of digital communication through corporate-owned content-sharing platforms, social-networking sites, and operating system-specific mobile applications. This shift in how much of communication practice is organized and overseen necessitates careful consideration of the potential benefits and concerns brought to light by these new tools. On one hand, innovation has expanded the scope of information exchange and mnemonic discourse beyond the traditional borders of the nation-state as the expense and time required to transmit materials—whether documents, voices, images, or videos—from one corner of the world to the other have become nil. In contrast, the reconfiguration of communication, encompassing everything that was once categorized across a dichotomy of public and private, under the umbrella of transnational corporations has given them a unique power to control the singular discourse and, as an extension, cultural memory. In order to understand the impact of governmental policy on the business practices of content-sharing platforms and the consequences for unintentional archives, a working definition of this category of digital communication tools is necessary.

Corporate content-sharing platforms come in many shapes and sizes. Some focus on particular categories of content. Some emphasize integrated social-networking tools more than others. Some cater to niche categories of users. Unlike peer-to-peer services, these platforms are designed with the goal of aggregating material for temporary access rather than the permanent transfer of files. While the download of files is possible, content-sharing platforms emphasize viewing over caching. For videos, this is accomplished through Flash-enabled streaming of content. For photos, this means browsing through compressed thumbnails rather than full-size raw image files. Access to the original files is often limited, either by denial of access instigated by the user who uploaded it or by site designs that omit the necessary tools to strip out the content. Unlike social-networking sites like Facebook, which also allows users to post images and videos to their profiles, content-sharing platforms spotlight the material more than the personality of the user posting it. While some platforms do allow users to craft an identity on the site and provide contextualizing information, viewing it typically requires clicking through to a secondary page and is certainly not required. For the purposes of this study, I will focus on YouTube, the popular U.S.-based platform that aggregates user-generated video content alongside sponsored content and channels. YouTube has become the default option for millions of users worldwide because the ease of use and the size of its built-in audience, making it ideal for examining how corporate ownership affects the archive of digital cultural production. This does not mean that similar collections of user-generated content on less prominent content-sharing platforms should be overlooked by preservation efforts. This is especially true

given the shifting popularity of sites like these, a fact which only magnifies the need to collect these artefacts before they disappear.

Since its launch in 2005, YouTube has provided seemingly unlimited bandwidth for uploading and storing videos to any user willing to invest a few minutes of their time to complete a brief account creation process and check a box promising that they had read and agreed to the site's terms of service. The price of participation for those who just want to view the videos housed on the site is even lower, requiring no account or login process. Like many Internet startups, YouTube began without a clear plan for monetizing the service provided. As it evolved, the project developed a financial model driven by advertising and corporate sponsorship before ultimately being purchased, a little over a year after it appeared, by the most dominant transnational provider of Internet-based services today, Google. From day one, the incredible growth of the video-sharing site and its monopoly over would-be competitors has been driven by offering the service at no visible cost to users—though the aphorism about nothing being free holds true in terms of the quantity of personal data collected from site visitors in exchange for their use of the site—and developing a sleek user interface that makes posting and finding videos second-nature for all but the most technologically disadvantaged. The success of the site is astronomical, with over 4 billion videos viewed daily and more than 800 million unique visitors each month. Like its parent company, the scope of YouTube extends well beyond its origins as an American company, with over 70 percent of traffic coming from locations outside the United States and localized sites in approximately 50 languages in 39 countries .

Following the theoretical trajectory marked by practitioner-scholars—from librarian Karen Gracy , who problematized the shifting authority of professional archivists in light of the growing popularity of content-sharing platforms, to archivist Rick Prelinger, who highlighted the absence of social responsibility embodied by these sites when compared to formal analogue archives of cultural heritage—Jean Burgess and Joshua Green have defined YouTube as an “accidental archive” of cultural production. They argue that YouTube is unique in that has collected billions of hours of valuable material, everything from old advertisements and media clips to original creative works, despite the fact that this content is aggregated on the site for fleeting use with little recognition of its importance as a resource for future scholars, archivists, librarians, and the general public. Videos are accessible primarily through search algorithms rather than explicitly curated and are posted with no promise of lasting preservation. While Burgess and Green touch on all of the important features of the YouTube phenomenon, the collective assembly of cultural material on this content-sharing platform hardly seems accidental. The clustering of communication practice around technologies that allow individuals to broadcast themselves to the broadest audience at the lowest cost using the simplest interface is not a new or surprising trend. The repository of user-generated content on YouTube may be better identified as an “unintentional archive,” which emphasizes the absence of curation and attention to preservation that characterizes traditional archives and further delineates this material from intentional attempts to widen access to archival material through digitization being conducted by traditional cultural heritage institutions on these same platforms. While the U.S. Library of Congress and the Smithsonian Institute both currently maintain channels on YouTube that replicate a small percentage of content from their physical archives among other public engagement efforts, the focus of the unintentional archive is exclusively user-generated born-digital cultural production.

Beyond the technological threats to preservation shared with online archives intentionally created and maintained by traditional cultural heritage organizations, the location of unintentional archives within the ecology of privately-owned content-sharing platforms like YouTube makes them subject to additional

imperilment as a result of market economic factors. These sites, housed under the corporate umbrella of publicly-traded transnational media companies, are responsible first and foremost to their investors. This means turning a profit, an outcome often at odds with the expectations and practices of site users. Burgess and Green provide one example of how the pursuit of profits can conflict with the organic ways that users have appropriated the tools provided for their own purposes, describing initial user backlash against the addition of channels sponsored by legacy media institutions . While this commercial element has become the new norm on the platform, the incident is a useful reminder that the way that sites like YouTube are used today is not necessarily how they were originally envisioned by their creators, nor is their continued use in that manner guaranteed. This is particularly true of their role as sites of unintentional archival practice.

To fully understand what is at stake in failing to acknowledge the value of unintentional archives and properly develop strategies for counterbalancing the privatization of digital heritage, imagine what would happen YouTube was shuttered tomorrow. Where would the content go? Who would be able to access it? The potential danger for these digital artefacts extends beyond the worst-case scenario of a business failure. What if the corporation simply decided to shift focus because the current model was no longer generating sufficient profits? What if the site's functionality remained largely the same but the company rolled out a radically different TOS agreement? What if your local political leaders suddenly decided to pressure the service provider or its parent company to adhere to strict policies for censoring certain content or be forced to quit doing business in that country, as already happens under restrictive regimes like those in China, Pakistan, and India? The policies dictating the use of sites like YouTube make no promises about the future. This uncertainty is further aggravated by the location of privately-owned media companies beyond the reach of nation-state governance of important issues like free expression.

4. Where the First Amendment Ends: From the Constitution to Terms of Service

When culture is constructed and maintained through privately-controlled domains, the Constitutionally-protected rights of individuals, like the freedoms of speech, religion, and assembly enjoyed in the United States, are no longer guaranteed. As Jack Balkin has argued, the First Amendment, which ensures those rights for all Americans, no longer has as much relevance in the information age. He purports that this shift is not because the free expression of ideas and the unencumbered exchange of information have become somehow less important, as the right of individuals to contribute to democratic culture remains an essential liberty . In fact, free expression online has traditionally been encouraged by Section 230©(1) of the Communications Decency Act of 1996, a provision which releases all manner of Internet content providers from liability for the speech of individuals posting to their platforms, including that which might be categorized as hate speech, defamation, or libel. While this theoretically minimizes the potential motivation for these sites to actively police and censor users, this does not reflect common practice. They universally reserve the right to remove content from their sites whenever they see fit and terminate your account without explanation. With few exceptions, the U.S. federal government is not in the business of forcing companies to serve every potential customer, so content-sharing platforms can set whatever policies they want and the only recourse for users who disapprove is to stop utilizing that service. The law of the nation-state is effectively replaced by the law of the corporation, with the latter being far more absolute. While state and federal statutes governing conduct in the United States are subject to the promise of due process and open to some possibility of appeal through the judicial system, users of

corporate content-sharing platforms are subjected to all-or-nothing scenario. Whether they realize it or not, users automatically subject themselves to all stated policies as soon as they visit one of these sites and companies are not shy about reminding users that they are free to leave if they are not satisfied with the terms of use.

While First Amendment protections for individuals are undercut when communication moves to content-sharing platforms, the corporations behind these sites enjoy one very important right granted by the federal government through the Digital Millennium Copyright Act (DMCA) of 1998: immunity from prosecution for copyright infringement related to user-posted content if they comply with notice-and-takedown procedures that require the removal of questionable material immediately upon request from copyright holders. This additional protection is necessary because Section 230 of the CDA does not apply in cases of intellectual property violation. Combined with ever-expanding protections for intellectual property that disproportionately favor copyright holders, especially legacy media conglomerates, the DMCA is the largest factor shaping how U.S.-based content-sharing platforms do business. As profit-seeking enterprises, sites like YouTube—which traffics heavily in popular culture artefacts that are inescapably protected by copyright—are prime targets for infringement litigation. Unlike individual users posting videos to the site, YouTube’s parent company, Google, actually has the deep pockets required to pay out on the substantial fines and court costs associated with conviction for intellectual property violations. Not wanting to bother with litigation or risk potential financial penalty, these platforms err on the side of caution when it comes to responding to accusations of infringement. Wendy Seltzer has argued that the net effect of this “safe harbor” provision in the DMCA is a further chilling of free expression for users, as content ranging from campaign videos to home movies to transformative creative works has been removed in response to notice-and-takedown orders with very limited opportunity for individuals posting such content to argue against it. Though it is the only Constitutional privilege Google and Yahoo! uphold religiously, the enforcement of the intellectual property rights of content creators still hinges on the policies of the individual company created in the context of the law rather than direct government legislation. The language governing how each platform manages notice-and-takedown orders is established by its TOS agreement and, as very few infringement cases ever make it to trial thanks to the DMCA, there is little opportunity for intervention on behalf of users whose content was wrongly censored. This is only magnified by the transnational presence of YouTube and the fact that it rarely adjusts its business model as it expands into other countries. Given the concerns for free expression, this casual modeling of U.S. policy norms in countries all over the world through YouTube’s practices, combined with the effects of formal international copyright escalation like the Anti-Counterfeiting Trade Agreement (ACTA), is dubious at best.

With its dense legal prose, the YouTube TOS agreement follows the same basic outline as other content-sharing platforms, sketching out a variety of responsibilities and restrictions for users alongside important exemptions for the company. Though they have occasionally launched widespread campaigns to notify users of significant policy revisions and required individuals to acknowledge their compliance by clicking “accept,” tacit agreement to the company’s terms does not require registering for an account. If you do not agree with any aspect of the terms, are under 13 years old, or are otherwise incapable of issuing consent, you are instructed not to visit the site at all. Much of the language, especially prominent sections of all-caps text, is dedicated to releasing the corporation from any and all liability for any personal injury, property damage, defamation, criminal prosecution, loss of content or service, illegal appropriation of your content by others, or exposure to false or obscene content that may arise from use of the platform. If you have an account and it is misused without your permission, you are liable but

YouTube is not. Other sections focus on what users are not allowed to do, including distribute, modify, access, or commercialize any aspect of the service or its content unless through YouTube approved channels and with the company's permission. User accounts may be cancelled at any time at the discretion of the company without justification and content uploaded to the site is never returned. A special subsection, called "Community Guidelines," celebrates individual free expression half-heartedly while laying out types of content that will be censored by the site, including videos featuring sexually explicit content, graphic violence, gross or shocking material, or other "bad stuff like animal abuse, drug abuse, under-age drinking and smoking, or bomb making" . Harassment, invasion of privacy, and spamming are also prohibited at the discretion of the site, but no concrete information is provided about how these issues are handled other than by flagging videos for review by YouTube staff.

Regarding intellectual property, the TOS agreement states that the act of posting a video assumes that the user has addressed all potential copyright concerns and has the rights to do so. If this is not the case, liability for intellectual property violation is placed solely on the individual users. Uploading content to the site automatically grants YouTube "a worldwide, non-exclusive, royalty-free, sublicenseable and transferable license to use, reproduce, distribute, prepare derivative works of, display, and perform the Content," though the user retains their ownership rights. The remaining value of those ownership rights, given the breadth of the license YouTube grants itself to your content as soon as you post it, is not explained. The license on videos expires within the vague window of "a commercially reasonable amount of time" after you delete them, however the company retains perpetual rights to use of all comments made on the site as it sees fit. Even when the video license expires, the company reserves the right to keep copies of deleted content even though it may not display them, rendering the promise of users being able to maintain ownership rights over their original content seem even less relevant. Finally, the processes for notification and counter-notification related to copyright infringing material in compliance with the DMCA are included as part of the terms of service, though little contextual information for how YouTube will actually process complaints is provided.

There are a number of provisions of the YouTube's TOS agreement that are particularly relevant to the unintentional archives of cultural production aggregated on the platform and potential efforts to capture and preserve that content. With the exception of public search engines, automated web crawlers are prohibited. Where permissible, they are only allowed to index content without caching it. Furthermore, despite numerous third-party web browser applications that provide this function, downloading content is forbidden unless facilitated through a service provided by YouTube. The language in the TOS agreement is sufficiently vague that this would seem to apply to users who wanted to regain access to their own content, in the case of their copy becoming corrupted or lost, as well. Users are not allowed to "copy, reproduce, distribute, transmit, broadcast, display, sell, license, or otherwise exploit any Content for any other purposes without the prior written consent of YouTube or the respective licensors of the Content," which would put the burden on non-profit online archivists, such as the Internet Archive, and traditional cultural heritage institutions to ask for permission and gain agreement before carrying out any outside preservation program. Finally, the TOS agreement announces the company as an exclusively American, subject only to the federal laws governing the U.S. and the state and local laws of California, where its physical operations are located. Users in other countries are thereby required to interpret their use of the site through the additional frame of the laws where they live on their own. While it covers a significant amount of legal ground, the overall effect of the TOS agreement, unsurprisingly, is to limit any potential use of the site or its content in ways not approved by YouTube, to release the company from all liability by placing it on individual users, and to grant the company exclusive license to

manage the site however they choose. The result is the severe limiting of both the potential for unencumbered self-expression on a popular digital communication platform and the possibility of adequately documenting the unintentional archive of cultural production housed there.

5. Mapping the Future: Three Emergent Models of Born-Digital Cultural Heritage Preservation

The privatization of digital heritage as communication practice shifts to corporate content-sharing platforms is a problem without a clear solution. The first step—raising awareness about the existence of unintentional archives of important cultural artefacts on the sites—is always the easiest. Through papers like this one and interdisciplinary collaboration between media scholars, information technology experts, policymakers, and non-profit advocates, it is possible to spread the message of the value of archiving born-digital cultural production and the urgency with which we must develop strategies to preserve it broadly. Unfortunately, awareness is not enough. Implementing a plan of action is complicated by the emergence of the new memory ecology and the globalization of mnemonic practice as a result of ICT. The free flow of information across physical borders has transformed the issue of preserving heritage from one of local concern, easily managed within traditional nation-state borders, to one that concerns us all. To date, three models for managing the preservation of born-digital content have emerged. One model depends on the benevolence of corporate content-sharing platforms to recognize the import of what they have collected and take steps to share and preserve it as part of the historical record. The second prototype looks to government policymakers to repair the state of copyright in their own countries in order to encourage access to cultural production and then work together on an international scale to develop archival practices that reflect the global nature of communicative culture today. The final scenario involves non-profit preservation organizations driving change by designing tools to gather content from these private sites, charging headfirst into legal gray areas or even by openly flouting existing intellectual property laws, and collaborating with traditional cultural heritage institutions. Each approach certainly has its benefits and flaws and exploring them will be helpful in guiding best practices for the future.

As I have stated previously, the profit-driven motives of corporations often run counter to public interest in the greater good. This is why the self-determined laws governing activity on these sites never account for preservation or make promises for the future. Part of what makes some enterprises more successful than others are flexibility and adaptability in the face of change, whether technological, economic, political, or social. Laying out a plan for ensuring access to their products and services decades or even hundreds of years from now is neither a priority nor particularly beneficial to the bottom line. Still, one platform has responded to its significance as dominant mode of communication by exploring options for digital preservation. In 2010, Twitter announced that it would partner with the Library of Congress to archive every public tweet since the site launched four years earlier . Made possible by a legal document called a “Gift Agreement,” Twitter donated a complete copy of its current archive and all tweets going forward, including whatever copyright license the platform had claimed on the user-generated content, to the Library with the stipulation that any of it could be made available to the public after a 6-month window from the date of original posting had passed. Managing the massive quantity of data and creating a user interface to allow researchers to access it in the future is an undertaking that is still in progress, the burden of which has been placed entirely on the Library of Congress . Among the more obvious downsides of this type of arrangement is the fact that the material, while duplicated on the servers of a traditional cultural heritage institution with a long track record of archival responsibility and

experience managing digital content, none of it is actually accessible to the public for research or review two years later. Nagging concerns also persist over whether the complex copyright issues of who owns tweets have been fully resolved and whether the individuals who originally generated this enormous backlog of data should have any say in this repurposing of their content. As Twitter is a transnational platform like YouTube, there is the serious question of whether negotiations between an American company and a U.S. cultural heritage institution should determine the fate of content produced by users across the globe. Most importantly, this model depends heavily on the self-aware public relations-driven benevolence of corporations, which are notorious fickle when it comes to matters of public interest, to take action. As Twitter has recently decided to monetize the same content archive by packaging it for data-mining companies who want to sell the information they can glean from it to marketers, it seems unlikely that this is a sound means of guaranteeing the security of all cultural production housed on content-sharing platforms for future generations .

The second scenario is twofold, requiring governments around the world to enact legislation that would lower some of the barriers to preservation posed by stringent copyright protections and then actively invest in the development of collaborative digital archival projects. This appears to be the least promising avenue for protecting unintentional archives. Copyright escalation has become a global issue, with the restrictive legislation of the U.S. being mirrored in countries far and wide, whether through internal revisions to nation-state policy as in Canada or through arm-twisting trade agreements like ACTA that encourage compliance among smaller nations using the carrot of beneficial commerce exchange. As the U.S. model increasingly becomes the default standard for copyright worldwide, it is important to note that there is far from universal support for the current legislation even in America. Non-profit advocacy group Public Knowledge has widely promoted its list of reforms that U.S. copyright laws need desperately to preserve the marketplace of ideas and facilitate access to cultural production, including shortening terms of protection, ending DMCA abuses, removing the unilateral ban on DRM-cracking, and increasing support for “fair use” in keeping with the knowledge-building spirit of the original framework for copyright found in the Constitution . Unfortunately, the momentum of copyright legislation is moving strongly in the opposite direction. Inter-governmental coordination of collaborative digital archiving initiatives has been somewhat more successful, with projects like the World Digital Library beginning to take shape at the behest of the Library of Congress and UNESCO. While the potential value of this resource in terms of global heritage is quite impressive, the focus so far has been on aggregating digitized reproductions of physical artefacts so the overall impact on born-digital archival practice and unintentional archives specifically is still unclear.

The third potential model for capturing and preserving born-digital cultural production on corporate content-sharing model uses non-profit organizations like Internet Archive in the U.S. and the Internet Memory Foundation, based in Europe, to spearhead their own archival projects, develop tools for collecting and curating content, and partner with traditional cultural heritage institutions. Founded in 1996 by web archiving advocate Brewster Kahle, Internet Archive is active on all three of these fronts and helped to establish the International Internet Preservation Consortium (IIPC), a coalition of almost 40 national libraries worldwide that collectively determines best practices such as standardized formats for website caching and divides up responsibility for capturing the whole of the web . Internet Archive is also widely recognized for its Robin Hood-like efforts to capture as much content as possible using web crawlers that copy sites without seeking preordained permission from site owners. While site administrators are free to use robots.txt files to block their pages from being crawled and/or to request that Internet Archive not capture their content, these stopgap measures do not always work. Working on the

general premise that what they are doing is part of an exigent cultural imperative to preserve communication taking place online today for posterity, they have yet to encounter many legal challenges, although use of their archive of webpages as evidence in business litigation has raised some initial concerns among corporate lawyers about the unapproved duplication of their client's sites. While the law has yet to catch up with the realities of digital cultural production and the need to preserve that material, the archival projects that Internet Archive has already implemented are impressive. Their "Understanding 9/11" archive of news footage from the week of the attacks, made possible by the organization's decision to begin recording digital broadcasts from 20 stations around the world on 24/7 basis in 2000, is an incredible research tool for media scholars. Their "Wayback Machine," a simple interface for accessing archived websites, allows users to pull up every version of websites that have been captured by their web crawlers. This includes more than 4,600 versions of YouTube captured between 2005 and 2011. While this is obviously an incomplete record of the content-sharing platform given how often new videos are uploaded and how many of the links on older versions of the site are now broken, it does hint at the achievable outcomes when motivated, innovative non-profits team with traditional cultural heritage institutions to accelerate the learning curve for digital archival practice.

Of these three emergent models, the latter seems most appropriate for ensuring the preservation of born-digital cultural production found in unintentional archives on corporate content-sharing platforms. The unique position of non-profits at once inside and outside the traditional heritage preservation system allows them the access and authority of working with legacy institutions as well as the flexibility to forge into uncharted legal territory in a way that government-affiliated libraries and archives cannot. As technologists, these passionate advocates have had great success convincing librarians and archivists in formal settings of the value of capturing the digital cultural record. This would naturally carry over into raising awareness about the particular sensitivity of unintentional archives and leading the charge into private domains where important public exchange is currently taking place. While the corporate benevolence and governmental reform scenarios promise uncertain results, non-profit partnership has already led to important improvements in coordinating born-digital preservation on the global scale required by the new memory ecology. It has also delivered concrete resources which enable researchers to work with these materials immediately and serve as a model for what can be accomplished in order to encourage traditional cultural heritage institutions around the world to take decisive action. The legal uncertainties surrounding some of their practices is a concern, however the fact that preservation techniques are constantly playing catch-up to rapid innovation in the field of digital communication and the reality that legislative reform moves even more slowly may justify this kind of action as the only way to prevent the loss of this material until they evolve. Non-profit partnership has also been essential in forging collaborative ties between distant traditional cultural heritage institutions, perhaps the most essential factor that will determine the success of born-digital archiving initiatives of the future. Coordination and standardization of these new archival practices across the global memory field is the only means of ensuring that the digital cultural record will be preserved in a way that accurately reflects its significance to contemporary culture.

Context 2.0

User Attitudes to the Reliability of Archival Context on the Web

Heather Ryckman

Abstract

The representation of context is the foundation of archival practice. With the phenomenal growth and popularity of Web 2.0 archival institutions are increasingly making their collections available online through wikis and photo-sharing sites. However, the structure of Web 2.0 sites and the inclusion of user contributed content have changed both the content and presentation of contextual information. This paper examines attitudes to the reliability of archival description online, including the role of user contributed content to the understanding of context, and draws conclusions on the function of archival contextual information online and its impact on users' understanding of context.

Author

Heather Ryckman has been working in the heritage field since 1995. In addition, to working as the Assistant Archivist for the Bank of Canada, Heather has held curatorial and collections management roles for such institutions as the Markham Museum, the Wallaceburg Museum and the Burlington Museums. She has also served as instructor for the Archives Association of Ontario's exhibit design and volunteer management seminars. She holds a BA in Ontario History and Anthropology, and an MA in Public History with areas of specialty in Museology and Ontario History. Heather has been employed as the corporate Archivist for The Co-operators Group of companies since May 2007.

1. Introduction

The documentation of context is the foundation of archival arrangement and descriptive practice, and is acknowledged as being integral to maintaining the authenticity and evidentiary value of archival records. Despite varying arrangement and descriptive processes worldwide for recording and presenting archival information, national and international standards acknowledge the primary importance of context in the understanding and interpretation of archival records.¹ The modern electronic recordkeeping environment has necessitated an expanded, more comprehensive, and inclusive view of both the nature of context and those who can and should interpret it. In addition to the increasing role of archivists as sources of knowledge, there is the recognition that archival users collectively may have more knowledge about archival records than an archivist,² and that there are many possible and constantly changing interpretations and provenances that can be ascribed to every archival record.

The online electronic environment has provided archivists with the opportunity to make their institutions and collections more visible and accessible to wider audiences. Yet in the race to make collections accessible, many institutions have changed the way in which they present and structure archival

¹ Some examples of standards which recognize the importance of context in archival description include: RAD (Rules for Archival Description), ISAD-G (International Standard for Archival Description, General), ISAAR-CPF (International Standard Archival Authority Record for Corporate Bodies, Persons and Families), DACS (Describing Archives: A Content Standard), and the Commonwealth Records Series system.

² Isto Huvila, "Participatory archive: towards decentralised curation, radical user orientation, and broader contextualisation of records management," *Archival Science* 8 (2008): 15-36, doi:10.1007/s10502-008-9071-0.

descriptions online. Web 2.0 has been heralded as a great opportunity for archivists to increase their visibility and serve an increased number of users. In reference to Web 2.0 sites such as Flickr, “the implications of this phenomenon are significant in that patrons will have increased information and description of a resource, an enhanced ability to find resources through search and browsing, and use of the resource as a connector to additional materials on the web.”³ Additionally, the openness and inclusivity of Web 2.0 is seen by many scholars as a means of permitting multiple voices and interpretations to enter archival descriptions, and provide a more comprehensive understanding of the nature and context of archival records. Yet as the archival community’s involvement in Web 2.0 initiatives grows, the completeness and accuracy of the contextual information become increasingly important.

Through an analysis and survey of case study websites, this paper will examine the impact of Web 2.0 practices on the presentation and ultimate perceived reliability of contextual information online.

2. Literature Review

Knowledge and understanding of context⁴ have long been recognized by the archival community as essential to the complete understanding of a record’s structure and content. As early as the late 1800s, historical investigation was used to provide an understanding of a record’s meaning.⁵ This meaning imbues records with the reliability, authenticity and usability required to be trusted and understood sources of evidence. In order for users to assess the validity of a record, users must be able to access the contextual information pertaining to the creation, custody and use of the record.

The nature of digital records has challenged archivists’ traditional understanding of the extent of context. Digital objects, unlike physical ones, lack the history and context of interaction and association that provides valuable information to the user and interpreter of the object.⁶ The ability of digital records to be imperceptibly changed and easily integrated into many different contextual environments affects both the nature of the context that needs to be documented, and the manner in which it is recorded. Additionally, the lack of transparency associated with the creation, alteration and use of digital records has resulted in a recordkeeping environment that is increasingly reliant on both context and trust as measures of the authenticity of a record. In assessing the integrity of a digital object, researchers must

³ Michael Zarro and Robert Allen, “User-Contributed Descriptive Metadata for Libraries and Cultural Institutions,” in *Research and Advanced Technology for Digital Libraries, Lecture Notes in Computer Science*, ed. Mounia Lalmas et al. (Springer Berlin / Heidelberg, 2010), 46.

⁴ The terms ‘context’ and ‘provenance’ will be used interchangeably in this paper. Despite the significance of the principle of provenance to all aspects of archival practice, there is no consensus as to the extent of the term and the best way to apply it. See Shelley Sweeney, “The Ambiguous Origins of the Archival Principle of “Provenance,”” *Libraries & The Cultural Record* 43(2008): 193-213. While the traditional notion of provenance was limited to the origins of the record, many modern archival scholars, including Terry Cook, “Electronic Records, Paper Minds: The Revolution in Information Management and Archives in the Post-Custodial and Post-Modernist Era,” *Archives and Manuscripts* 22(1994): 300-328, and Laura Millar, “The Death of the Fonds and the Resurrection of Provenance: Archival Context in Space and Time,” *Archivaria* 53(Spring 2002): 2-15, have argued for an expanded and more elastic view of provenance, and appear to use the terms “context” and “provenance” interchangeably. In addition to highlighting the lack of professional consensus regarding the meanings of both context and provenance, this suggests that concern over distinguishing between the two terms in the literature may be unnecessary.

⁵ Arnaldo D’Addario, “The Development of Archival Science and Its Present Trends,” in *Archival Science on the Threshold of the Year 2000*, ed. Oddo Bucci (Macerata: University of Macerata, 1992), 183.

⁶ Alan Wexelblat and Pattie Maes, “Footprints: History-Rich Tools for Information Foraging” (paper presented at the SIGCHI Conference on Human Factors in Computing Systems, 1999): 270-277.

“examine the provenance of the object...and the extent to which [they] trust and believe this documentation as well as the extent to which [they] trust the custodians themselves.”⁷

Initially, the archival presence online was characterized by the online finding aid. It is not only the finding aid, though, that is now being made available on the Internet. Archival and non-archival repositories alike are presenting digital representations of their holdings online. Some scholars suggest that the Internet provides a venue to allow records to be interpreted in multiple ways, which serve to “reveal complex and shifting meanings without abandoning a foundation from which such meanings can be gleaned,”⁸ thereby recognizing the complexity and constant meaning-making associated with all records. Other scholars note that Internet research relies on ad-hoc classification and associations, which shift based on the search parameters.⁹ This may result in search results and associations that are determined more by the search terms than by a record’s context.

The growth of Web 2.0 has continued to alter the role and priorities of archives online and resulted in a change in the content and presentation of context. “Using social media tools, archivists even invite user contributions and participation in describing, commenting, and re-using collections, creating so-called collaborative archives.”¹⁰ Collaborative archives are seen as a means of including the voices and interpretations of those unrepresented or under-represented within the archival record, thereby creating a more holistic view of the record and a shared identity and sense of community. Current recordkeeping and archival descriptive systems do not support multiple, simultaneous provenance or co-creatorship involving the exercise of mutual rights and responsibilities in records by all participants in the transactions they document.¹¹ The more openly structured environment of Web 2.0 may be more conducive to supporting and representing simultaneous provenance.

The characteristics and possibilities of Web 2.0, in particular its inclusivity of multiple voices and interpretations, are seen by many archivists as a panacea for the singular authoritative voice of the traditional archival finding aid. MacNeil considers the Web as an,

...ideal vehicle for transcending the artificial limits imposed by current descriptive practices and for exploiting an expanded vision of archival description; one that unseats the privileged status currently accorded to the standards-based finding aid and repositions it as part of a complex network of hyperlinked and interactive documentation relating to the history, appraisal, preservation, use, and interpretation of a body of records over time.¹²

Proponents of collaborative archives argue that user contributed content allows for discussion and discovery, and provides memories and knowledge about records which would otherwise go uncaptured.¹³

This is particularly true of communities which do not share their knowledge with outsiders, including a professional archivist.¹⁴ Yet the increased facility of discovery and discussion of records also threatens to weaken the role of context. The indexing of user contributed comments, which are then searchable by search engines such as Bing and Google and result in researchers being directed to archival resources and related user comments, may pose a problem if the comments the researchers were directed to view are inaccurate. The exporting or copying of the archival records to external, personal collections, or other secondary sites such as Wikipedia, is also problematic, because within these sites the original context of the record, as presented by the archives, may be lost or altered. Even when links between abridged Web 2.0 descriptions to more complete Web 1.0 finding aids are created to provide context to users, research suggests that there was considerably less redirection than expected.¹⁵ These results suggest that providing contextual information only in the Web 1.0 environment and linking to it in the Web 2.0 environment may not be sufficient to give researchers the necessary context.

Folksonomies, often created by 'tagging', are a common method for archives to elicit user contributed content, though there is much debate surrounding the relevance and value of this content. One of the primary values of tagging is that it permits many voices, experiences and interpretations to be reflected in descriptions. As Weinberger notes, "an author is an authority when it comes to what she intended her work to be about, but not about when [sic] it means to others. When it comes to searching, what a work means to the searcher is far more important than the author's intentions."¹⁶ Yet, if understanding an author's intent is essential to the understanding and preservation of context, it has yet to be determined how well folksonomies will be able to represent this context of creation. Bearman and Trant note that "museum collections remain relatively inaccessible even when 'made available' through searchable online databases"¹⁷ due to the professional terminology employed. The use of folksonomies, written in the language of the user, may increase the user's ability to retrieve the required records, but it is unclear whether folksonomies assist the user to understand the records better once retrieved.

User comments and notes are also frequently cited in the literature as a means of allowing multiple voices and interpretations to be heard.

The user searching for an image likely has little or no concept of the context in which the tag was submitted, and therefore may be presented many results in a search that are in fact not relevant in context. In contrast, the comments and notes we studied appear to be meant almost entirely intended to add context to an image.¹⁸

By allowing other perceptions and interpretations to describe context, there is the worry that inaccurate or poor descriptions may result; descriptions which threaten the authenticity and reliability of the records in question. The anonymity of user contributed content "makes it difficult to determine

Archive: Towards Decentralised Curation, Radical User Orientation, and Broader Contextualisation of Records Management."

¹⁸ Zarro and Allen, "User-Contributed Descriptive Metadata for Libraries and Cultural Institutions," 51.

whether information is biased, since users cannot know the motives for information provision, and the lack of cues about the expertise of contributors similarly inhibits users' capacity to determine the accuracy of information provided."¹⁹ While archival descriptions are by no means objective there is an attempt on the archivist's part to be aware of their own bias. Popular or public interpretations of the records may lack this awareness. Additionally, the archivist likely has access to more information about a record's context than does an online user, who determines his or her tags on an item level, or at best, based upon a small sampling of documents belonging to a much larger whole. If the descriptions presented are wholly inaccurate, or inflammatory, there is little guidance in the literature about how the public evaluates the interpretations of context presented and how these various interpretations impact the overall authenticity of the archival record. At present, the vast majority of contributors to archival sites participate at no more than a cursory level to the archival descriptions, identifying individuals and correcting errors. Few extrapolate or expand upon an existing record description. This paucity of user contributed information may not be enough to represent reliably the multiple voices that the archives is seeking.

3. Research Methodology

To determine the presentation of context online, and attitudes towards this presentation, this paper poses the following research questions:

RQ1: What differences exist in the representation of context between Web 1.0 and Web 2.0 pages?

RQ2: What differences exist between patterns of use in Web 1.0 and Web 2.0 pages?

RQ3: What user attitudes exist towards the representation of context in the case study pages?

This research was carried out within an integrated post-custodial and post-modern theoretical framework as elaborated upon by Terry Cook.²⁰ The recognition of the fluidity and complexity of archival context forms the foundation for the role and importance of Web 2.0 and user contributed content in archival description. There is no common position among archivists regarding the extent of information required to document a record's context properly, or to represent this context online. What can be asserted is that the following types of documentation enable users to make sense of the context of records online:

1. Creator Documentation: information that explains the circumstances surrounding the creation of the record. This can include the name of the record's creator, the function, mandate and administrative structure of the record creating body, and the social, political and economic environment in which the record was created
2. Relationship Documentation: information that documents the relationships between the record creator, the record users and the record custodians. This can include information about associated records.

¹⁹ Andrew J. Flanagin and Miriam J. Metzger, "From Encyclopaedia Britannica to Wikipedia," *Information, Communication & Society* 14(2011): 258.

²⁰ Cook, "Electronic Records, Paper Minds: The Revolution in Information Management and Archives in the Post-Custodial and Post-Modernist Era," highlights the importance of context to provide meaning to archival records and to make visible the actions, agendas and functions which lead to and explain a record's creation. Cook also identifies the need for archivists both to recognize and to include the multiple contexts and understandings of archival records within archival description.

3. Control Documentation: information that documents the custodial history of the record. This can include control or other identifying numbers, transfer dates and agents, history of arrangement, and information pertaining to the creation, revision or deletion of retrieval tools.
4. Records Documentation: information that documents the chronology and use of the record. This should include the date of creation and specifics of reproduction and re-use.

User contributed content was considered contextual description for the purposes of this study, presuming that the content of the descriptive information fell into one of the documentation types outlined above. User contributed content consists of digital images, text, tags or any other form of content supplied by individuals external to the archival institution.

The research was conducted in two stages. Due to the exploratory nature of the research, the small number of subject websites, and the number of features on each to be examined, a case study methodology was used in Stage One. Attitudinal measurement was used in Stage Two. In Stage One, case study Web 1.0 and Web 2.0 sites were evaluated using a survey (scale) that measures features of the content design and execution in the representation of context. In Stage Two, user attitudes to Web 1.0 and Web 2.0 depictions of context online were evaluated using a Likert scale based on archivist and user cohorts.

3.1 Stage One: Research Design

In Stage One, to ensure consistency of evaluation, a Web 1.0 page was paired with the equivalent Web 2.0 page that documents the same record. Each pair of sites also represents a different example of Web 2.0 expression—a mash-up, a photo sharing site, and a wiki.

3.1.1. National Archives of Australia (NAA)

Web 1.0 – NAA Record Search: B2455, BUTCHER R T

The National Archives of Australia's "collection mainly documents Australian government activities since Federation in 1901."²¹ Its online catalogue, called RecordSearch, provides information about the records held by the Archives. Records are arranged hierarchically into functional series; item level, related records, and recording and controlling agency descriptions are provided via links at the series level description. Users to the site can perform basic or advanced keyword and subject searches or search by photograph, name or passenger arrivals index. The catalogue includes digital reproductions with some record descriptions, however the description was not accompanied by an electronic copy for the subject record of this paper.

Web 2.0 – Mapping our Anzacs: Ralph Thomas Butcher

Mapping Our Anzacs is a mash-up, participatory website managed and hosted by the National Archives of Australia. In 2007, the National Archives of Australia released online copies of all the records in Series B2455 which contained the records of the men and women who served in the armed forces during World War I. Mapping Our Anzacs provides access to these 375 971 service records as well as related user contributed content including biographies and photographs of veterans. Users to the site can add notes and photos to the virtual scrapbook or build a tribute to a loved one. Geographical searching is the primary

²¹ National Archives of Australia, "Using the Collection," <http://www.naa.gov.au/collection/using/>.

means of accessing the records. Users to the site can search by place of birth or enlistment or by veteran name.

The idea behind Mapping Our Anzacs is to use that place-based information to provide a new pathway to the records. We thought that a spatial pathway into World War I service records would make sense for local communities where, in many cases, a World War I memorial is central to the town and the community...It is the place-based information in each record title that give the records a structure. We have attempted to map each place name to a global position, so you can now find records by browsing the maps rather than by searching. You no longer need to know in advance what you are looking for, and you can see the relationships between records, rather than seeing each one in isolation.²²

Due to the arrangement of the records on the site and the method of enlisting and collecting user contributed content, the site is less focused on providing context to the service record; rather the service record and user content are made available primarily to provide context and biographical information about the individual military service person about whom the service record is written.

3.1.2 Library and Archives Canada (LAC)

Web 1.0 – LAC Archives Search: Dog Child, a North West Mounted Police scout, and his wife, The Only Handsome Woman, members of the Blackfoot Nation

Library and Archives Canada's online collections catalogue is called Archives Search. The catalogue provides descriptive and contextual information about the records held by Library and Archives Canada. Users to the site can search textual, photographic, iconographic, audio, philatelic, cartographic, architectural and other documents by performing a basic, advanced or image search. Basic searching is done by keyword, material type, hierarchical level and whether the item is digitally reproduced online. Advanced searching includes all basic search categories as well as date, and source fields. Image searching is by keyword and material type. Similar to The National Archives, records are arranged hierarchically into fonds or collections. Descriptive content is based upon the level being described and is not repeated at lower levels of description. Some descriptions include a link to a digital reproduction of the record.

Web 2.0 – Flickr: Dog Child, North West Mounted Police scout, and his wife, The Only Handsome Woman, members of the Blackfoot Nation

Library and Archives Canada also holds a pro account with the photo management and sharing site, Flickr. Flickr has over 10 million active groups and 60 million photographer users.²³ Library and Archives Canada uses the site to exhibit and make available digital reproductions of photographs from their archival collection. In many cases these photos are grouped into photostreams based upon a common category or theme. The subject item, a photograph entitled, *Dog Child, a North West Mounted Police scout, and his wife, The Only Handsome Woman, members of the Blackfoot Nation*, is grouped into the Pride and Dignity photostream. Images making up this photostream were originally part of an exhibition entitled, Aboriginal Portraits.

²² Mapping Our Anzacs, "About This Site," <http://mappingouranzacs.naa.gov.au/about.aspx>.

²³ Flickr, "Home," <http://www.flickr.com/>.

3.1.3 The National Archives (UK)

Web 1.0 – The Catalogue: Item CO 137/350/52

The National Archives' online catalogue contains "11 million descriptions of documents from central government, courts of law and other UK national bodies, including records on family history, medieval tax, criminal trials, UFO sightings, the history of many countries and many other subjects."²⁴ Its mandate is to make available information pertaining to the holdings of The National Archives. Information pertaining to the holdings is made available through keyword, date range and department or series code search capabilities. While the online catalogue provides important contextual information for the researcher about the Archives' holdings, the site does not contain digital reproductions of any archival documentation, thereby requiring the researcher to visit the Archives in person to view and use the records. Catalogue descriptions are arranged and described hierarchically with the department functioning as the highest level of description, followed by division, series, sub-series, sub sub-series, piece and item. The content of the description is based upon the contextual information at the level described. This information is not repeated at the lower levels of description. Catalogue descriptions are written by Archives staff.

Web 2.0 – Your Archives: Inside Kingston Lunatic Asylum: the case of Ann Pratt

One of The National Archives' web 2.0 initiatives was the wiki, Your Archives. The wiki was launched in 2007 as a means of "providing an online platform for users to contribute their knowledge of archival sources held by The National Archives and other archives throughout the UK."²⁵ Since that time over 31 000 people have registered and contributed or updated articles, over 21 000 articles have been created, almost 260 000 edits have been made, and there have been over 6 million visits to the site with more than 50 million page views.²⁶ User contributions to the wiki are intended to enhance the archival descriptions provided by Archives staff in The Catalogue, research guides, Documents Online and The National Register of Archives. Users can search or browse by the subject or content of the articles.

As redirection from a Web 2.0 site to a Web 1.0 finding aid is a common practice among archival institutions for providing fuller contextual descriptions, it was also necessary to identify whether the contextual information was presented through primary or secondary means. Primary presentation will be defined as information that is immediately available to the user on the Web 2.0 case study page. Secondary presentation will be defined as information that requires the user to perform an additional action, such as clicking on a link, in order to be viewed.

4. Stage One: Results

4.1 Presentation of Context

A review of the Web 1.0 sites and their Web 2.0 equivalents revealed a number of things about the presentation of context. In general, the mandate of each site determined the extent and nature of contextual information. Mapping Our Anzacs, for example, placed the soldier as the focus of the

²⁴ The National Archives, "The Catalogue," <http://www.nationalarchives.gov.uk/catalogue/>.

²⁵ Your Archives, "Home," http://yourarchives.nationalarchives.gov.uk/index.php?title=Home_page.

²⁶ Ibid.

description rather than the archival record presented on the site. As a result, the user contributed content is heavily biographical in nature. Regardless of the mandate of the site, there were some general commonalities in descriptive practice. None of the sites, either Web 1.0 or Web 2.0, provided significant amounts of contextual information through primary access. Within online catalogues this is likely due to the hierarchical descriptive practice within most archival traditions. As a result, much of the contextual information is not located at the record or item level, but instead can be found at the series or higher levels of description. In each Web 2.0 site archivists provide a hyperlink back to the item level of description in the online catalogue. By these means any user has access to fuller contextual descriptions should they be prepared to follow the required number of hyperlinks. The most common fields of description completed at the primary level, regardless of Web 1.0 and Web 2.0 environments, were control number (all sites save one—Mapping our Anzacs), date of creation (all sites), and creator name (excluding the two NAA sites). When this seemingly basic information is lacking, it may be due to descriptive tradition and the more biographical focus of the Web 2.0 site. The least common fields of description completed at the primary level were information pertaining to record control, specifically custodial information, such as transfer agents and dates. This may be due to archival descriptive tradition and the fact that the information is made available at a higher level. Specifics of reproduction, which one would expect to be described at the item level, were also excluded on most subject sites.

4.1.2 Creator Documentation

On most sites contextual documentation concerning records creators and creating agencies was limited to the name of the record's creator. All the sites, with the exclusion of the two National Archives of Australia sites, provided primary access to the name of the body responsible for the creation of the subject record. For the most part, primary access was not provided to additional information concerning the creator's function, mandate, personal history, or administrative or family structure. Only the Your Archives wiki provided personal background documentation concerning Ann Pratt, the author of the subject record.

4.1.3 Relationship Documentation

Only one online catalogue, that of the National Archives, provided primary access to information about associated records and this information was very limited in its scope, consisting of an arrangement structure with hyperlinks to the higher levels of description. The pamphlet by Ann Pratt is also mentioned at the item level in association with the government's response document, *Official Documents on the Case of Ann Pratt, the Reputed Authoress of a Certain Pamphlet...* The Library and Archives of Canada's online catalogue provided secondary access to documentation concerning associated records in a variety of ways, depicting a multiplicity of relevant contexts. The photographer's name is hyperlinked, providing the user with the ability of associating the subject photograph with others taken by the same creator. The 'show arrangement structure' link also allows users to associate the item with other records within the same fonds and series. A notation regarding the subject photograph's inclusion in an exhibition entitled, "Aboriginal Portraits," under the additional information field, not only provides users with the record's context of re-use but also documents new associations and relationships that have come about during LAC's custody of the record.

Documentation surrounding the context of association was more prominent on the Web 2.0 sites than in the online catalogues. All three Web 2.0 sites attempted to situate the subject record within a

wider scope of related records. This context of association, however, did not always mirror the associations provided by the online catalogue. The Mapping Our Anzacs site states that by mapping geographically and browsing maps rather than by searching, “you can see relationships between records, rather than seeing each one in isolation.”²⁷ While the Web 2.0 site links the records spatially, the NAA online catalogue links and associates records according to the office of creation, use and transfer. Similarly, LAC has situated its subject photograph within a folder entitled “Pride and Dignity.”²⁸ In both instances the Archives has, arguably, situated the record within an artificially constructed context that does not necessarily mirror the record’s original context of association. It may, however, reflect the record’s more modern context of use.

4.1.4 Control Documentation

Documentation concerning records control and custody both in online catalogues and in Web 2.0 was incomplete. All sites provided primary access to the record’s control number, but only The National Archives’ online catalogue provided primary access to additional control information. Evidence of the arrangement of the pamphlet within the larger record series is illustrated at the item level, though an explanation of the arrangement of this record and its associated series is only available at the higher levels of description through secondary access.

The majority of control documentation, such as evidence of arrangement, transfer agent and transfer date, is available at higher levels of description. In most cases this information is available to users of the online catalogues through secondary access via hyperlinking to the series or collection/fonds level descriptions. Access to this same control documentation is also available to users of the Web 2.0 sites via hyperlinks to the online catalogue, but the contextual information is that much more removed from the user, requiring multiple navigation actions on the part of the researcher.

4.1.5 Records Documentation

Records documentation, such as the date of creation, specifics of reproduction and record re-use, are not prevalent within either the online catalogues or the Web 2.0 sites. The date of creation was the only contextual information to be provided on all sites, with the exception of Mapping Our Anzacs.²⁹ There is some discrepancy regarding the date of the photograph, *Dog Child, a North West Mounted Police scout and his wife, The Only Handsome Woman, members of the Blackfoot Nation*, between the LAC online catalogue and the Flickr site. While the LAC catalogue lists the date of creation as ca. 1890, the Flickr site gives a more specific date of 1890. This may be the result of a conscious decision by LAC to simplify information for Web 2.0 users. An examination of other photographs within the same folder suggests that LAC is deliberately omitting the word “circa” from its Web 2.0 descriptions. Another photograph in the

²⁷ National Archives of Australia, “About This Site.”

²⁸ Pride and Dignity is an exhibition of over 60 photographic reproductions (c. 1846-c.1960) taken from the original exhibition Aboriginal Portraits from the National Archives of Canada produced by Edward Tompkins and Jeff Thomas, guest curator, and exhibited at Library and Archives Canada during the spring and summer of 1996.” See Flickr, “Pride and Dignity,” <http://www.flickr.com/photos/lac-bac/sets/72157624189241172/>.

²⁹ Although the date of record creation is present on the Mapping Our Anzacs site, the information was not supplied directly by the NAA. The original record was dated by the records creator. A digital reproduction of the item is available to view from the site thereby giving users access to the date of creation upon viewing the electronic copy.

same folder, *Innu (Montagnais) woman, probably taken at North West River, Labrador, ca. 1930*, has also had the “circa” removed from the date of creation field in Flickr, though the date in the online catalogue includes the word.³⁰ Regardless of the motivations behind the date change, the discrepancy provides two potentially different contexts of creation for the same record. If, in fact, the context was amended to simplify information for Web 2.0 users, it raises a number of concerns about the impact, and appropriateness of the simplification of context for Web 2.0 users.

It could be expected that since digital reproductions of the subject record are available on each of the Web 2.0 sites, some contextual information regarding reproduction and re-use would be more prominent on these sites. This does not appear to be the case, however, as none of these sites provide primary access to this information. Two of the three sites, Flickr and the Your Archives wiki, do provide varying degrees of contextual reproduction and re-use information at the secondary level. Your Archives contains two digital reproductions, one of the subject record and one of an associated record, each of which includes a file history field, available by clicking on the digital image. The file history records image specifics such as preview and full resolution size, file size and MIME type. It also indicates when the file was uploaded to the site, its dimensions and the creator or source of the reproduction. A note on the re-use of the LAC photo appears on the home page for the Pride and Dignity exhibit on Flickr.

Only LAC provides information about the re-use of its photo in its online catalogue. This documentation is available under the ‘additional information’ heading of the item description. Under this heading the photograph’s inclusion in an exhibition entitled, “Aboriginal Portraits” is mentioned.

4.1.6 User Contributed Content

Due to the diversity of sites chosen for this study, the nature of the user contributed content varied considerably between the sites. The wiki provided the contextually richest user contributed content, with users responsible for supplying the entirety of the record description. The mash-up and photo-sharing sites provided details specific to the subject and mandate of the site but did not necessarily add greatly to the context of the record.

The mash-up provided photos and biographical information which contributed to an understanding of the soldier about whom the record was written. While this biographical information is both interesting and important, it adds little to the context of the service record displayed on the page as the soldier was not responsible for the record’s creation and later use. It can be argued however that the biographical information has some contextual utility as it further authenticates the validity of the record.

Comments left by users on LAC’s Flickr page featuring the photograph of Dog Child also have limited contextual utility. The majority of the comments centre on the origins or type of sword that Dog Child is holding and how he came to acquire it. Similar to the mash-up, the additional information may be useful to further validate or invalidate the authenticity of the image, but it is not particularly contextually rich. It is notable that Flickr users also put forward theories as to how Dog Child acquired the sword. The users do not question the truth of the image before them, or that the image was, in any way, staged with props according to the photographer’s aesthetic. Instead they make guesses as to how Dog Child could

³⁰ Compare Library and Archives Canada, “Innu (Montagnais) Woman, Probably Taken at North West River, Labrador, Ca. 1930 / Femme Innu (Montagnais), Probablement Photographiée À North West River (Territoires Du Nord-Ouest), Vers 1930,” Flickr, <http://www.flickr.com/photos/lac-bac/4666289053/in/set-72157624189241172/>, with Library and Archives Canada, “Innu (Montagnais) Woman, Probably Taken at North West River,” http://collectionsCanada.gc.ca/pam_archives/index.php?fuseaction=genitem.displayItem&lang=eng&rec_nbr=3224646.

have acquired such an item. These guesses, which do not appear to be based upon any research, not only threaten to recreate a biographical history for Dog Child, but they also highlight users' unquestioning belief in the truth of the record presented to them.

4.2 Discussion

The results of the examination and comparison of the Web 1.0 and Web 2.0 sites suggests a number of trends regarding the presentation of context. First, archivists rely heavily on hyperlinks to furnish users with contextual information. Hyperlinking is used in both online finding aids and Web 2.0, though for arguably different purposes. Hyperlinking in Web 1.0 is used to provide access to higher levels of contextual description in order to facilitate a more complete contextual understanding and to eliminate the need for duplication of information between levels. By contrast, the practice of hyperlinking back to the online catalogue from Web 2.0 appears to be practised as a means of eliminating the need to provide anything more than a bare-bones description within Web 2.0. The expectation and reliance by archivists on users to seek additional contextual information through hyperlinking may not be justified, however. The Smithsonian's experience using Flickr suggests that there is little redirection by users from the Web 2.0 site to the archives' online catalogue.³¹

A second trend in the presentation of context is the difference in the contextual mandate between online finding aids in Web 1.0 and Web 2.0. In one study, Yakel observed that in different environments "archival information and records are uncontextualized, or at the very least differently contextualized."³² While her study noted the differences in descriptive practice between online and analogue finding aids, it is fair to suggest that a further difference exists between Web 2.0 description and that of online finding aids.

Online finding aids in Web 1.0 are more likely to focus on information associated with traditional ideas of context, such as the context of record creation, while Web 2.0 sites appear to be less concerned about the origins of the record and more focused on generating and presenting newer meanings. By grouping records geographically, in the case of the Mapping Our Anzacs site, or by subject, in the case of the Flickr site, the Archives are visually presenting a context, based not upon the origins of creation, but instead upon a consciously-curated mandate. While the context of creation remains accessible through hyperlinks, it is the newly-created context which is given the pride of place and predominance.

The relationship between context and trust was also highlighted through this site examination. It appears that users believe in the truth of what they see regardless of the amount of context provided by the archives. This suggests that while contextual information can be used to provide authenticity to a record, it is not necessarily a requirement for Web 2.0 users. Perhaps Web 2.0 users value archival records merely for their aesthetics and care little about their wider context. Schwartz notes that,

traditional item-level description of photographs, indexed by subject and credited to the photographer, but without adequate contextual information about their functional origins and provenance, or clear links to such contextual information, transforms photographic

³¹ Martin Kalfatovic et al., "Smithsonian Team Flickr: A Library, Archives, and Museums Collaboration in Web 2.0 Space," 272-273.

³² Elizabeth Yakel, "Impact of Internet-Based Discovery Tools on Use and Users of Archives" (paper presented at the XXXVI Roundtable on Archives (CITRA) Meeting, France, 2002), 195.

archives into stock photo libraries, reducing photographs to their visible elements and conflating photographic content and photographic meaning.³³

Alternatively, users may unquestioningly believe in the accuracy of the archival record simply because it was made available to them by a trusted archival repository. Yakel's research suggests that for researchers, "the presence and placement of the finding aid in the archives is an implicit sign of authority."³⁴

A final trend noted through this examination was the possible simplification of context on the Web 2.0 sites. This can be seen in the comparatively smaller descriptions provided on these sites as well as the removal of the word 'circa' from photograph dates on Flickr. While it is unclear why LAC chose to remove this word, its practice of doing so raises many questions. Is the online catalogue considered the only authoritative source of information and therefore all other arenas of access are not required to be accurate as long as they point back to the authority record in the online catalogue? If, in fact, the word 'circa' was removed as a simplification for Web 2.0 users, why is the word considered appropriate for the online catalogue? Without understanding the mandate of LAC's Flickr presence it is difficult to answer these questions. This practice does suggest, however, that not only do the Web 1.0 and 2.0 sites have different mandates, but it is expected that they will have different audiences, each of which requires a different type and quantity of contextual information. Duff and Harris state, "what we choose to stress and what we choose to ignore is always and unavoidably subjective, and the value judgements that archivists made affect in turn how our researchers find, perceive and use records."³⁵ The conscious decision to simplify, alter, or omit contextual information will affect users' understanding of archival records.

5. Stage Two: Research Design and Results

The second part of the research consisted of a quantitative analysis evaluating attitudes of archivists and patrons of archival services towards the contextual information presented on the case study sites. The target population consisted of professional archivists and users accessed from listservs and discussion lists in North America and Australia. A usable sample of 71 respondents comprising 40 Archivists ($n_1 = 40$) and 31 users ($n_2 = 31$) was constructed using snowball sampling. Data collection was carried out through the use of an online survey tool created through the Qualtrics online survey service. Each question had a link to the specific website to be evaluated. Questions were closed-ended and employed an ordinal scale (coded Strongly Disagree = 1; Strongly Agree = 5) to measure attitude. Question order was also randomized. Demographic questions were used to identify different user groups within the samples. The largest age cohort by percentage was 40-49 with a greater proportion of respondents in the younger age ranges (20-29, 30-39 and 40-49) as opposed to the older ranges. The most common level of education among respondents was a Master's Degree with a greater proportion of respondents possessing higher university degrees at the Master's and Doctorate levels. Variance within the samples was based upon familiarity with archival records and retrieval tools, and the type of archival research generally conducted. The two most predominant categories of research conducted by users were academic and genealogical.

³⁴ Elizabeth Yakel, "Archival Representation," *Archival Science* 3(2003): 13.

³⁵ Wendy Duff and Verne Harris, "Stories and Names: Archival Description as Narrating Records and Constructing Meanings," *Archival Science* 2(2002): 275.

The mode for use of archival facilities was 1-5 times in the past year with the predominant preferred method of accessing archival records being through a combination of both online and in-person visits.

Stage Two of the research tested the following hypotheses:

H₁: Attitudes to the *reliability* of contextual metadata are related to the host page type (Web 1.0 or Web 2.0).

H₂: Attitudes to the *reliability* of contextual metadata appearing on Web 1.0 and Web 2.0 pages are related to whether a person is an archivist or user.

H_{2.1}: Attitudes of archivists to the *reliability* of contextual metadata appearing on Web 2.0 sites differs from that of users.

H₃: Attitudes to the *use and reliability of comments and tags* to understand contextual metadata appearing on Web 2.0 pages are related to whether a person is an Archivist or user.

Survey participants were asked to respond to four statements regarding the reliability of the contextual data on the case study sites.

S1. The information on this page about the record's creator is reliable.

S2. The information on this page about when the record was created is reliable.

S3. The information on this page documenting how and why the record was created is reliable.

S4. I think the content supplied by users on this page is reliable.

For each statement, respondent data for each of the six case study sites was imported to SPSS with additional data describing the nature of the sites (Web 1.0 or Web 2.0) and the respondent type (archivists or users). The Wilks Shapiro statistic and a normality plot showed all data to be *abnormally* distributed.

5.1 Data Screening and Analysis: H₁

Overall respondents considered information about context reliable across Web 1.0 and Web 2.0 sites. The skew is much less pronounced for Web 2.0 across each of the statements, indicating that respondents are less positive about the reliability of contextual information describing the record's creator, when the record was created and how and why the record was created. This finding is most notable in the context of S3.

For each of the first three statements, the data was further explored using cross tabulation and a Mann-Whitney U Independent Samples test. Across S1, S2 and S3, the cross tabulation showed that both archivists and users regard Web 1.0 as more reliable than Web 2.0. Statistically significant differences at the 95% ($\alpha=0.05$) confidence level were demonstrated with statements S1 ($p=.000$), S2 ($p=.000$), and S3 ($p=.031$). These differences were significant enough to reject the H₁ null hypothesis in relation to statements S1, S2 and S3.

5.2 Data Screening and Analysis: H₂

Further testing was conducted to see if significant difference existed in attitude between archivists and users. Generally, respondents considered the information presented to be reliable. The skew is significantly less pronounced among both archivists and users for S3, suggesting that both groups were less positive about the reliability of information concerning how and why the record was created. Additionally, a markedly higher skew amongst archivists' in response to S2 indicates that they were more positive than users about the reliability of information about when the record was created.

For each of the first three statements, the data was explored using cross tabulation and a Mann-Whitney U Independent Samples test. Statistically significant differences at the 95% ($\alpha=0.05$) confidence level were demonstrated with statement S2 ($p=.028$) resulting in a rejection of the H_2 null hypothesis for this statement. The low p -value of S1 ($p=.069$), while not statistically significant, suggests that further study, employing a larger sample size, may be indicative of an attitudinal difference between groups. Overall, users are less positive towards the reliability of contextual information, particularly information pertaining to who and when the record was created (S1 and S2 respectively) than are archivists. There is no marked difference in attitude between archivists and users towards the reliability of contextual information pertaining to how and why the record was created (S3).

Additional Mann-Whitney tests were conducted on all three statements to test $H_{2.1}$. Statistically significant differences at the 95% ($\alpha=0.05$) confidence level were not demonstrated with any of the statements. Therefore $H_{2.1}$ is rejected for all three statements. The p -value for S1 ($p=.055$) and S2 ($p=.061$) do suggest the possibility that there may be a difference in attitude between archivist and users to the reliability of contextual information pertaining to the record's creator and when the record was created on Web 2.0 sites. A larger sample size is necessary to evaluate this possibility further.

5.3 Data Screening and Analysis: H_3

Additional testing was carried out to determine if significant difference existed in attitude between archivists and users to the reliability of user contributed content. The data displays a negative skew, indicating agreement among both archivists and users that comments and tags are reliable. The more pronounced negative skew and higher mode among users suggests that they are more positive about the reliability of comments and tags than are archivists.

The cross tabulation shows that the majority of both archivists and users neither agree nor disagree that comments and tags are reliable. Few respondents display strong agreement with the statement and both groups have some variation in attitude among respondents regarding the reliability of comments and tags. Statistically significant differences at the 95% ($\alpha=0.05$) confidence level were not demonstrated with statement S4 ($p=.728$) resulting in a retention of the H_3 null hypothesis. The low p -value of S1 ($p=.069$), while not statistically significant, suggests that further study, employing a larger sample size, may be indicative of an attitudinal difference between groups. Overall, users are less positive towards the reliability of contextual information, particularly information pertaining to who and when the record was created (S1 and S2 respectively) than are archivists. There is no marked difference in attitude between archivists and users towards the reliability of contextual information pertaining to how and why the record was created.

5.4 Discussion

Statistical testing reveals that both archivists and users are inclined to find the information on a Web 1.0 site to be more reliable than information found on a comparable Web 2.0 site. In addition, there is evidence to suggest a difference in attitude to the reliability of contextual information between archivists and users. Specifically, archivists are more likely to find contextual information about the record's creator and when the record was created to be reliable than users. While no statistically significant differences were noted between the attitudes of archivists and users to the reliability of contextual information on Web 2.0 sites, the results of statistical testing do suggest the possibility that a difference in attitude may

exist. Further testing, employing a larger sample size, is required to determine the extent of attitudinal differences between archivists and users and whether this difference is equally present amongst Web 1.0 and Web 2.0 sites.

Statistical testing also reveals that both archivist and user groups are not strongly disposed to agree or disagree that comments and tags are reliable. There was some variation of response among both groups of respondents indicating that there is little consensus of opinion regarding the use of comments and tags as contextual information.

Overall, the perceived reliability of contextual information is significantly different between Web 1.0 and Web 2.0. This may be due, in part, to users' reluctance to trust user contributed content and sites which contain this type of information. Flanagin and Metzger have noted that perceived low-expertise sources are considered less credible and therefore less trustworthy.

The lack of author identification makes it difficult to determine whether information is biased, since users cannot know the motives for information provision, and the lack of cues about the expertise of contributors similarly inhibits users' capacity to determine the accuracy of information provided.³⁶

The inherent lack of credibility of user contributed content, irrespective of the content on the specific survey case study sites, was also suggested by the survey results, which indicated that the Your Archives wiki was not considered reliable, despite the fact that its content was written predominantly by a National Archives archivist. Survey respondents, both archivists and users, were neutral towards the reliability of user contributed content as contextual information and this suggests the possibility that archivists do not consider contextual information on Web 2.0 to be as authoritative as information in the Web 1.0 finding aid. These results, particularly among archivists, are surprising given the scholarly recognition of the potential of user contributed content to broaden and enhance record descriptions.

6. Conclusion

A review of relevant literature has indicated that authors have written extensively on the fact that context is integral to the evaluation of archival records for authenticity and the establishment of user trust. Context has been recognized as incorporating not only the original provenance of creation but also subsequent interactions and use by both users and archivists.³⁷ In a digital environment, context becomes particularly important as researchers must evaluate a copy of the original record, often in isolation from contextual clues such as physical associations between records and documentation of digital reproduction.

³⁶ Flanagin and Metzger, "From Encyclopaedia Britannica to Wikipedia," 258.

The mandate and structure of Web 2.0 adds a further level of complexity to the nature and evaluation of contextual information. While the opportunity exists for user contributed content to enhance context by permitting multiple voices and interpretations of the record to be recognized, Web 2.0 is largely unmediated, allowing both accurate and inaccurate information to exist side by side, thus blurring, rather than enhancing, contextual information.

The intent of this study was to examine the differences in the presentation of context between Web 1.0 and Web 2.0 sites and measure differences in attitude towards the reliability of this information among archivists and users. Though only a preliminary study, the study found variation in the way in which institutions described context online and significant differences in attitude towards the presentation of context on Web 1.0 and Web 2.0.

It is clear, both from the site analysis and attitudinal survey, that the presentation of context, and attitudes towards the reliability of this information, are significantly different between Web 1.0 and Web 2.0. Despite the opportunities that Web 2.0 provides for broader, richer, contextual information, archivists do not appear to place much stock in the reliability of this information. Perhaps it is this distrust of user contributed content among archivists that has resulted in Web 2.0 sites serving a different mandate than their Web 1.0 counterparts, with Web 2.0 sites functioning less as sources of contextual information and more as outreach and awareness tools—places where select archival collections can be highlighted and new contexts and associations created. Through the creation of artificial contexts or displacement of original contexts, archivists are changing the contextual framework within which records will be evaluated. The resulting lack of contextual clues and the online search tools and item-level tagging and description threaten to present archival records in isolation without both physical and intellectual clues as to their history and reason for inclusion online, weakening the perceived reliability of the contextual information presented and ultimately undermining the authenticity and integrity of the archival records.

Preserving Social Media

Opening a Multi-Disciplinary Dialogue

Abstract

Digital artefacts generated through use of social media tools have potential long-term value to individuals, organizations and societies. If there is a desire to systematically collect and preserve accounts of daily life, government activities, and societies' documentary heritage, archival approaches must account for changing information systems—the tools, policies, and practices through which we engage in the contemporary information ecosystem. Through this paper we argue that in light of the growing complexity of digital information practices, particularly in relation to the use of social media, archivists need look to the scholarship of design and planning, in particular the work of human computer interaction designers. In turn, the designers of digital information systems need to engage, draw upon, support, challenge and inform contemporary archival theory and practice.

Authors

Lisa P. Nathan is an Assistant Professor at The University of British Columbia's School of Library, Archival and Information Studies (the iSchool@UBC). Since 2010, she has served as the Coordinator for the school's First Nations Curriculum Concentration. Her research is motivated by the high potential for interactions with information systems to have a long-term influence on the human condition. Through a range of projects she investigates theory and method related to the design of information systems that address long-term societal challenges; information practices that develop and adapt as we use these systems; and factors that influence the sustainability of these systems over time.

Elizabeth Shaffer is a doctoral candidate at the School of Library, Archival and Information Studies (the iSchool@UBC) from which she received a Master of Archival Studies degree. Her dissertation research is at the intersection of social media and archival theory focusing on the preservation, policy and recordkeeping challenges posed by information and communication technologies, in particular social media. Her work aims to build on existing archival theory and practice to inform policy on social media use and records management and preservation.

1. Introduction

The digital artefacts generated through use of social media tools have potential long-term value to individuals, organizations and societies. If there is a desire to systematically collect and preserve accounts of daily life, government activities, and societies' documentary heritage, archival approaches must account for changing information systems—the tools, policies, and practices through which we engage in the contemporary information ecosystem. Through this paper we argue that in light of the complexity of digital information practices, particularly in relation to the use of social media, archivists need look to the scholarship of design. In turn designers, specifically designers of digital information systems, need to engage, draw upon, support and challenge contemporary archival theory and practice. Through this paper we argue that the field of human computer interaction is uniquely positioned to work with archivists to both inform archival theory and practice and in turn to be informed by archival theory and practice.

Archivists are well aware of the long-term influence records and the information systems that hold them have on the ability of future generations to access and interrogate their documentary heritage. We illustrate the potential for these collaborations by applying the design scholarship of Rittel and Webber¹ to a specific archival challenge, governments' use of social media. Through a discussion of Rittel and Webber's concept of a "wicked problem" we identify paradoxes that arise as system designers, users, and archivists approach social media artefacts from a plurality of conceptions concerning what is of value. We identify intersections where these interested parties might engage the problematic situations that the wish to preserve social media documentary objects foregrounds. We posit that this nascent conversation between concerned parties has the potential to lead to future generations of digital platforms that more deeply engage the broad societal challenges of the long-term preservation of digital documentary artefacts.

2. Context

The near ubiquitous use of social media by individuals, organizations and governments is generating documentary digital artefacts, the nature of which much is unknown. The various platforms individuals and organizations utilize to generate social media artefacts are often held by third party for-profit organizations whose business models are predicated on the collection, aggregation and monetization of users' data. The ephemeral nature of this web based information and the rapid evolutionary nature of social media tools and technologies facilitates an information ecosystem whose modalities, affordances and practices challenge the application of traditional archival functions such as appraisal, preservation and access. Just in the past five years we witnessed the disappearance of entire online communities and the majority of their digital artefacts with the dissolution of GeoCities and the rebranding of the social bookmarking site delicious when it was purchased by Yahoo in 2005. The business models that facilitate the use of and access to these sites and their data are often in direct conflict with the obligations and motivations of societies to ensure the preservation of their digital heritage. Individuals, organizations and governments utilizing these platforms are challenged because of the conflicting values present in this environment—those of the platforms' designers; the platforms' owners; the platforms' users and the social, political and technical environments in which these roles operate.

These examples highlight how the challenge of preserving digital heritage increases exponentially as ever shifting digital information systems evolve, along with the practices and policies through which we enact them. Yet, the *UNESCO Charter on the Preservation of Digital Heritage*² declares the necessity to ensure the long-term preservation of the world's digital heritage in all forms. It states that digital heritage is a "common heritage" amongst all nations consisting of assets that are "unique resources of human knowledge and expression"—many of which "have lasting value and significance" requiring protection and preservation for future generations. The purpose of which is the long-term accessibility to the public. The threat of loss is very real and action is needed by all stakeholders as "continuity of the digital heritage is fundamental."³ The development of social media is simply one of many phases in the continuing evolution of information and communication technologies, and based on current tools and

³ Ibid.

practice, we are likely to lose the documentary artefacts from this stage. Although loss of entire systems of knowledge is by no means unique in the history of humankind, we are not convinced that this is a precedent to intentionally follow.

3. Reframing by Design

Through this position paper we argue that if the long-term preservation of documentary digital artefacts created through engagements with social media, is a goal, it requires the archival profession to (re)consider *where* in the digital artefact generation process they engage. Similar to the shift that happened in the realm of electronic records, when it became necessary for archivists to inform the design and use of formal record systems, we propose that archivists engage proactively with those who design contemporary and future information systems. As a nascent step in this direction, we suggest an inquiry into the field of design where scholars are well versed in the art of taking action in problematic situations when there are many unknowns.

To start the inquiry, we turn to the work of Rittel and Webber in the early 1970's and their description of a "wicked problem."⁴ Working at the intersection of the design and planning disciplines, Rittel and Webber's work is in large part a response to growing public dissatisfaction with unsuccessful crime reduction programs, disappointing education reform projects and similar failed societal initiatives. They begin with a strong critique of the idealized, linear representations of societal problems prevalent in the early 70's. They illustrate why rationalistic, hard science inspired approaches to highly problematic situations are doomed in large part because societal problems are by their very nature multi-faceted and ever changing, thus they are neither fully knowable nor solvable. As an alternative, Rittel and Webber introduce the term wicked problem, a moniker for societal problems that "are never solved. At best they are only re-solved-over and over again."⁵

We posit that if there is a desire to systematically collect and preserve accounts of daily life, government activities, and societies' documentary heritage as generated within social media platforms, then striving to meet that desire represents a *wicked problem*. In the following paragraphs we apply select characteristics of wicked problems as described by Rittel and Webber to one type of social media engagement, governments' communications with their publics. Through this exercise, the government adoption of social media serves as an exemplar to illustrate the potential of design to help archivists reframe and engage challenge of "preserving" social media documentary artefacts.

In the following section we discuss select features of wicked problems and demonstrate how these characteristics can be fruitfully applied to the context of governments adopting social media tools. There are more features to wicked problems, but we wish to be illustrative, not exhaustive. We explicate Rittel and Webber's points, drawing them into a government context in an effort to ground the higher level argument, that the design of information communication technologies (e.g., social media tools) needs to be informed by the scholarship and discourse around the long-term access to our digital heritage.

⁴ Rittel and Webber, "Dilemmas," p. 160.

⁵ Ibid.

3.1. No Definitive Formulation

Rittel and Webber argue that “the formulation of a wicked problem *is* the problem!”⁶ It is necessary to formulate the problem and conceive of the solution at the same time. Their presentation of the hard sciences approach describes a linear process from problem statement, to hypothesis, to experimentation and then to solution. However, for wicked problems, they claim that through determining the right question, one begins to develop the solution. Consider the question: how to preserve trustworthy digital artefacts generated with social media over space and time. A positivistic approach would start with identifying the problem, then moving through a series of steps to figure out a solution. For wicked problems, the model of planning is that of an “argumentative process in the course of which an image of the problem and of the solution emerges gradually among the participants, as a product of incessant judgment, subjected to critical argument.”⁷

Governments have harnessed the affordances of social media technologies to open up innovative communication channels to facilitate immediate and ongoing interaction with their citizens.⁸ This engagement often utilizes a variety of third-party platforms with any number of evolving affordances. Yet, little is fully understood about the attributes of these products, the potential challenges they pose to archival theory and practice and whether it is possible to effectively apply current concepts of archival theory and practice to ensure that social media artefacts contribute to a trustworthy documentary heritage.⁹ Additionally, the policy environment within which these platforms are utilized often predates the onset of these technologies and has its foundation in a pre-social media environment. It is early in the investigation into the complexity of social media, the artefacts generated, the online environment they inhabit and the challenges they pose to traditional archival theory and practice. Archival scholars, practitioners and organizations are in the nascent stages of the “argumentative process” and an “image of the problem” is manifesting from the dialogue around the potential issues that social media artefacts and their long-term preservation present.¹⁰ Additionally, ideas and approaches are appearing in the literature, representing initial dialogues seeking (re)solutions to issues of appraisal,¹¹ capture and preservation,¹² and

Lee, “Collecting the Externalized Me: Appraisal of Materials in the Social Web,” in *I*,

policy.¹³ Those engaging in the discourse around these various projects are attempting to articulate the problem space in order to identify potential (re)solutions.

3.2. No Stopping Rule

Rittel and Webber posit that wicked problems can never be solved for good and one can always do better, however, factors that are external to the problem necessitate stopping when a “good enough” (re)solution is achieved.¹⁴ Such factors may be limited resources—time, money, or political will. There is no singular “solution”; rather, there is a continuous series of ever-evolving processes based on a combination of theory and empirical inquiry that inform the design of systems, practices and procedures.

Governments are rapidly adopting social media¹⁵ predicated on the belief that it is an effective way to engage with citizens through dissemination of information and active, multi-directional communication.¹⁶ As such, the adoption often follows a bandwagon approach, utilizing the most prevalent and popular tools at hand. This approach points to the no stopping rule as archivists are required to spend time, resources and resolve to continuously develop their knowledge of new platforms, and accompanying affordance and products. Additionally, external factors such as limited resources and regulatory and legal constraints in a government context contribute to the constant need to find “good enough” solutions.

3.3. Solutions are neither true nor false

Wicked problems have no true or false answers. The assessment of proposed solutions are often judged on criteria of “better or worse” or how “satisfying” a solution may be.¹⁷ Government use of social media creates a variety of influences that will affect the satisfaction of any given solution. Tensions between and among legislation governing privacy, freedom of information, data protection, intellectual property, access and retention all complicate a potential agreed upon set of formal rules to determine the correctness of a solution. (Re)solutions that are supported technically may not fully support ethical or legal responsibilities.

¹⁷ Rittel and Webber, “Dilemmas,” p. 163.

3.4. There is no immediate and no ultimate test of a solution to a wicked problem

Experimentation with dependent and independent variables that allow a scientist to determine causal relationships are not possible when one is wrestling with a wicked problem. The variables refuse to be isolated. It is not possible to trace all of the repercussions of complex information systems (tools, practices, policies, protocols) developed to preserve social media, to a singular, temporal stopping point where they can be judged. There are unforeseen consequences to each solution that are played out over an “unbounded” period of time.¹⁸ These dynamic consequences, in a government environment, can lead to undesirable outcomes that have impacts across contexts, including policy, decision making, and/or legislation.

3.5. No true trial and error period

With wicked problems, every implemented solution is consequential and the traces of these solutions cannot be undone. A system’s very existence is going to influence human lives resulting in various personal, organizational, and political repercussions. A government’s use and subsequent action to engage with citizens via social media does not create “trial” information and/or records, but rather potential digital heritage material with long-term value. If the choice of system allows the monetization of citizen data, the design of data within a system wherein the identity or integrity of the information is in question, or if users’ privacy and security are put at risk by using the system, such actions have irreversible repercussions. Subsequently, the actions taken by governments to preserve this information, if implemented with an ineffective solution, could result in the loss of irreplaceable documentary heritage and/or potential records of government actions and accountability. As such, every attempted solution counts and must be weighed both for its repercussions and the consequences that may result from the necessity to “undo” the solution. For example, a government’s decision to elicit input into policy making or elicit voter registration via a third-party social networking site such as Facebook¹⁹ are actions with repercussions for the potential preservation of and access to this information. Can the government ensure the trustworthiness of data collected via Facebook? If this is the only way to engage with the process, what are the implications of citizens being “required” to use Facebook? What are the public policy implications for data access, privacy, and freedom of information?

Finally, we reflect on Rittel and Webber’s articulation of why they chose the term wicked:

[W]e are calling them ‘wicked’ not because these properties are themselves ethically deplorable. We use the term ‘wicked’ in a meaning akin to that of ‘malignant’ (in contrast to ‘benign’) or ‘vicious’ (like a circle) or ‘tricky’ (like a leprechaun) or ‘aggressive’ (like a lion, in contrast to the docility of a lamb).²⁰

Although a wicked problem is not indicative of malicious intent, it may be morally questionable, even deplorable, to ignore it. The design and use of social media by government bodies is by no means a morally deplorable act. It is actually necessary for citizens to gain access to their government through initiatives such as Open Data and Open Government. However, to ignore the difficulties of preserving the

²⁰ Rittel and Webber, “Dilemmas,” p. 160.

documentary artefacts created through these interactions with citizens has strong ethical (and legal) implications.

Through the exercise of applying the design concept of a wicked problem to the issue of preserving the documentary artefacts created through governments' use of social media to communicate with its citizenry, we develop an appreciation for the insights of design scholarship. The inquiry highlights the lack of a definitive formulation of the problem and that the argumentative process, the ongoing debates about what the problem is and how to address it, is indeed a critical part of the process. In turn, it is a process with no stopping point in that the challenges of digital preservation will never be solved for good. Instead there will likely be a series of iterative "good enough" (re)solutions. Indeed, the wicked problem framing suggests that there is no ultimate test for these solutions, no trial and error period, and there are many contextual constraints.

All of these obstacles, and yet, action needs to be taken. We suggest that archivists expand the dialogue to include consideration of design perspectives, not just in terms of utilizing design theory, but through direct engagement with the designers of digital information technologies. As one potential area for collaboration, consider the field of human computer interaction. Human computer interaction researchers and practitioners are informing, if not directly designing, the digital platforms upon which social media interactions take place and the resulting artefacts they generate.

4. Archivists Informing System Design

Scholars and practitioners from the field of HCI can assist archival theorists in facilitating the interrogation of attributes of records within a social media context, and in turn, be informed by archival theory in the design of future information systems. With a deep knowledge of human cognition, technological capabilities, networking, human computer engagement and the importance of cultural contexts, the field of HCI is particularly well positioned to buttress archival goals in the social media milieu. However, they must first develop an understanding of archival goals and the centrality of the record.

Archives have the responsibility of safeguarding and preserving *records* of citizens, institutions and governments for use by current and future generations. Within archival theory and practice there exists a nuanced understanding of the attributes of a record. Although contemporary social media documentary artefacts appear to hold the promise of serving as records they may not hold all the attributes of a traditional record. For them to do so presents complex challenges due in large part to their form and the context in which these forms of information are created. However, what these forms of information do hold is the potential for informing societal memory and holding governments, institutions (public and private), and individuals accountable for their actions.

As Terry Eastwood points out, "the first object of archival theory is the nature of archival documents or records."²¹ Archivists' expertise lies with the creation, preservation and use of records and archives and the context of their creation and use—including the social, legal, technological and cultural environment.²² The ability of the document to attest to the fact and act it captures for action, future reference and/or to extend memory,²³ the trustworthiness of records is what archivists can contribute to

²¹ Terry Eastwood, "What is Archival Theory and Why is it Important?" *Archivaria* 37 (1994): 122–130.

²² Elizabeth Shepherd, "Archival Science," in *Encyclopedia of Library and Information Sciences*, ed. Marsha J. Bates and Mary Niles Maack, 179–191 (Taylor & Francis, 2010).

²³ Eastwood, "Archival Theory."

the broader discourse on systems design. How might archival concepts such as trustworthiness and archival practices inform/educate designers as they work to design systems?

Politicians hold town halls and announce policy reform,²⁴ governments encourage voter registration²⁵ and citizens engage with agencies and commissions²⁶— all within third-party social media platforms. All of these actions have the potential to generate digital artefacts that contribute to the documentary heritage of the early 21st century. Yet, the modalities and ephemeral nature of social media artefacts can be antithetical to the archival requirement to preserve authenticity and ensure reliability and accuracy over time and space. It is not enough to “save it all”—archival attention to provenance and context, archivists’ understanding of the concepts that underpin trustworthy records are relevant principles that should be applied in this shifting social media landscape in order to effectively capture and preserve this digital documentary heritage.

At this point in the conversation we are not cheeky enough to suggest that we have answers; however, we have plenty of questions such as: how can archival theory and practice evolve to keep pace with rapidly changing technologies and transforming information practices in contexts utilizing social media? How can archival theory and practice inform the design of social media information systems? How can the information policies that mediate and regulate information practice account for ever-evolving technologies and their affordances?

5. Conclusion

Current practices in the field of HCI focus on ways to support interaction in the shorter-term rather than issues of longer-term preservation, societal heritage and understanding. In the past, thinking about how to preserve records post hoc worked pretty well. The difference between preserving records post-hoc in the pre-digital environment and the complexity of trying to do the same in the current information and communication technology environment is enormous. Pre-digital it was possible to gather documents in a box at semi regular intervals, knowing that at a later date it would be possible to effectively preserve the documents deemed records when resources permitted. In a paper environment, there was often sufficient information recorded on the documents themselves and within the recordkeeping system, information practices were often understood well enough to reconstruct context, and the medium was stable as long as environmental controls were monitored. In the contemporary social media environment, there is no digital box that Facebook transactions are being tossed into. We cannot depend upon standardized information being encoded in these transactions, the information practices are not well understood, there is limited or no control over the creation of these documents, and the medium is less stable than invisible ink. As research into long-term digital preservation has shown, preservation in the digital environment must begin at creation.²⁷ In the born digital environment archival input needs to be part of the initial information system design. If an archival professional is called upon only after the systems are created and the practices and policies are in place, all she can do is provide a professional opinion of what has been and will continue to be lost.

The Role of Culture in Digitization and Digital Preservation

Preservation Cultures

Developing a Framework for a Culturally Sensitive Digital Preservation Agenda

Fiorella Foscarini, Gillian Oliver, Juan Ilerbaig and Kevin Krumrei

Abstract

All current attempts to frame and normalize organizational practices in the digital domain have certainly enriched our understanding of contemporary recordkeeping. However, they have also functioned as mechanisms that have helped reduce rather than explore complexities. When tested against real-world situations, existing models and standards only appear to work in relation to types of organizations that resemble traditional bureaucracies. Additionally, because they are designed according to some engineering-like approach, those models prove to be hardly applicable to ill-defined problems, as most of the problems faced by information specialists tend to be. This paper argues for a non-prescriptive, empirical, and situated approach to digital preservation, one that takes into account the cultural properties (i.e., values and practices) of any stakeholder involved. Investigating cultures at all levels (i.e., organizational, national, supra-national, professional, group) and, in particular, trying to understand 'information cultures' (i.e., the values accorded to information and attitudes towards it) as well as the factors affecting those cultures, are the main goals of a research project whose initial steps are described in this paper. Applying the information culture concept will enable the development of a culturally sensitive framework for digital preservation.

Authors

Fiorella Foscarini is an Assistant Professor in the Faculty of Information at the University of Toronto, Canada. She holds a Ph.D. in archival studies from the University of British Columbia in Vancouver. Before joining academia, she worked for a decade as senior archivist for the European Central Bank in Frankfurt am Main, Germany. In her teaching and research, Fiorella uses diplomatics, genre theory, and organizational culture concepts to explore the meaning of records creation, and to enrich the theory and practice of records management.

Gillian Oliver is a Senior Lecturer in Archives and Records Management at Victoria University of Wellington, New Zealand. Her doctoral degree is from Monash University in Australia. Her professional practice background includes developing the initial requirements for Archives New Zealand's digital archives. Gillian's research interests centre on understanding organizational dynamics, and the influences of culture on behaviours and attitudes to information.

Juan Ilerbaig has a Master's in Information Studies from the iSchool, University of Toronto (2012), and a Ph.D. in the History of Science and Technology from the University of Minnesota (2002). His research interests focus on the intersection between record keeping and the practice of science, with particular attention to such issues as communication genres and information culture. He has published articles in the *American Archivist* and the *Journal for the History of Biology*, among other journals.

Kevin Krumrei is a graduate student in the iSchool at the University of Toronto. Having completed graduate work in philosophy (epistemology and ethics) and religion (religious semantics in the context of philosophy of science and logical positivism), he is interested in expressions of corporate and organizational culture, as they manifest in the presentation of identity in social media.

1. Introduction

For the past two decades, several models, methods, and strategies have been developed for the purpose of ensuring the longevity of our individual and collective memories in digital form. Archivists and records professionals, librarians, information systems (IS) and IT experts, and various other specialized communities concerned with the preservation of digital artefacts (from space agencies to pharmaceutical companies) have been trying to come up with ‘solutions’ that would ideally be technologically neutral, widely applicable, and cost-effective. Standardization and uniformity are basic ideas that have ever since been guiding those communities’ efforts, as ensuring accessibility and usability of information objects and systems involve some degrees of interoperability and universality. However, it seems to us that the domain-independency goal has been pushed too hard to the detriment of getting an understanding of the specific needs of each environment.

Being prescriptive is another characteristic of traditional approaches to digital preservation—and is a common trait of other areas of intervention concerning the management of records and information as well.¹ This is again a way of moving away or distancing ourselves from ‘what goes on’ in actual situations and focussing on the design of ‘solutions’ that, in their coming close to ‘perfection,’ tend to depart more and more from the real-world problems faced by real organizations and individuals. The models and standards that will be examined in this paper provide the readers with a clear picture of what a digital repository or a trusted records preservation system *should* look like, based on a set of shared assumptions regarding the form records should have if they are to be reliable and authentic, the types of controls that should be in place in order to protect such fundamental record qualities, the actions that those dealing with digital objects are supposed to take, how an organization should overall work to be compliant with professional standards.

As individuals educated in the records management and archival discipline, we do subscribe to the values embedded in the models that we critique; however, we at the same time recognize that as much as the term ‘record’ often means different things to different people, the notion of preservation is anything but neutral or univocal. We argue that a *descriptive* and *situated* approach, an approach that is sensitive to the cultural variations and the ‘centrifugal impulses’ (to borrow from Bakhtin)² that exist between and within any human groups, should become a priority, if digital preservation is to serve the diverse needs existing in society—not just the needs of particular professional communities. By drawing a parallel with theories of linguistics, current approaches to digital preservation seem to focus on the Saussurian ‘langue’ (i.e., “language as a self-sufficient system of signs”) while leaving aside ‘la parole’ (i.e., “speech as the situated realization of the system by particular speakers”).³ Pierre Bourdieu objected to structuralism by saying that “this kind of distinction ... leads linguists to take for granted an object domain which is in fact the product of a complex set of social, historical and political conditions of formations.”⁴ Similarly, all our models and standards only scratch the surface of the object domain of digital preservation. New tools

⁴ *Ibid.*, p. 5.

are needed to capture actual instantiations of the processes involved in the creation, management and storage of digital objects and their deep meanings.

Current preservation frameworks take for granted but fail to grasp the specific socio-cultural conditions of records creation and use. In such frameworks, if culture is considered at all, it is mainly understood either as an *abstract* concept or as a *barrier* to the implementation of digital recordkeeping initiatives. The ideal seems to be an organization without culture (i.e., without particularities that make it deviate from the norm). This would make the implementation of systems and strategies straightforward. In some of those studies, knowing the kind of culture you are dealing with amounts to nothing more than using this knowledge to figure out the right way to approach stakeholders in order to push recordkeeping initiatives. We believe that the question is not so much one of labelling cultures as ‘good’ or ‘bad’, or identifying barriers in order to overcome them, because this way of thinking implies that there is one best way of doing recordkeeping that applies to all organizations and oversimplifies the complexity of the situation.

In order to start building the theoretical and methodological framework that would inform what we have named ‘a *culturally sensitive* digital preservation agenda,’ we set out to investigate the ‘information cultures’—that is, “manifestations of organizational culture that portray values and attitudes to information in organizations”⁵—characterizing a number of different semi-public⁶ and private sector’s organizations operating on a global scale and involving different types of industry (e.g., banking and finance, non-profit, information products and services). This innovative framework has been developed primarily by drawing on management and organization theory, IS research, knowledge and information management literature as well as genre theory.

2. Limitations of OAIS and other existing standards and models

The Digital Curation Centre (DCC) in the U.K. defines an Open Archival Information System (OAIS)⁷ as “an archive, consisting of an organization of people and systems, that has accepted the responsibility to preserve information and make it available for a Designated Community.”⁸ Thanks to its cross-domain applicability and promises of present and future accessibility and interoperability, the OAIS Reference Model has become *the* standard for building trusted digital repositories. It is a high-level model that specifies the functional entities needed to ensure the continuing preservation of information objects over time in a systematic and structured way.

The OAIS model assumes that the “Producer” shares with the “Archives” the responsibility for—and, before that, an interest in—creating and maintaining meaningful digital assets. The entity Archives takes care of all kinds of information objects *from the point of ingest* and involves a logical, rule-based system for their transformation into preservable, usable, homogeneously structured information packages. On the other hand, the standard does not prescribe or recommend any specific behaviour to be put in place by the Producer, and implicitly suggests that there is no need to investigate the motives that might

⁵ Gillian Oliver, *Organisational Culture for Information Managers* (Oxford: Chandos Publishing, 2011): 4.

⁶ We consider central banks ‘semi-public’ as on the one hand, they are public institutions (not being profit-oriented as commercial banks are) but on the other hand, they do not do business with the general public.

⁷ Consultative Committee for Space Data Systems, *Reference Model for an Open Archival Information System (OAIS)*, January 2002. Available at <http://public.ccsds.org/publications/archive/650x0b1.pdf>.

⁸ Digital Curation Centre Glossary of Terms. Available at <http://www.dcc.ac.uk/digital-curation/glossary-terms>.

have prompted the creation of the information objects or any other contextual features ‘in action.’ Negotiations between creating agencies and archives, which would take place any time before the ingest moment and would likely be based on formal descriptions of the agencies’ functions and activities, are considered a sufficiently informative mechanism to feed the descriptive elements involved in an OAIS.

This observation is in line with what Australian archivist Adrian Cunningham wrote in the context of his critique of the idea of digital curation:

The OAIS model makes no attempt to address what is probably the biggest challenge facing digital archivists: How do we find (or indeed ensure the creation of) reliable records that can serve as evidence of decisions and activities among the mountains of what are often dynamic, anarchic, and unmanaged data that organizations and individuals accumulate? If digital archiving is to succeed, it must include intervention in the creation and management of digital information, not just take submission information packages as a given and go from there.⁹

The “intervention” wished for by Cunningham would, in our view, aim at *understanding* what happened in the pre-ingest phase, rather than prescriptively define how the Producer should act in order to facilitate the Archives’ operations.

Not less abstract than the OAIS reference model is the Curation Life Cycle Model developed by the DCC. The DCC model not only refers to a broad category of “data” as its target, but it also covers the whole life cycle of such data.¹⁰ Nevertheless, the model appears unsatisfactory for several reasons. First of all, the series of “Sequential Actions” occurring throughout the life cycle contradicts the notion of simultaneous and recurrent action that the ‘continuum’ model has convincingly put forward since the beginning of the 1990s. Secondly, the model does not elaborate sufficiently on important segments of the life cycle, such as the one labelled “Create or Receive.” Based on which factors, on which elements of the real world, is the organization or individual supposed to “Conceptualize” (i.e., “conceive and plan the creation of data”) and then design and implement a preservation strategy that fits its purpose? Once again, the model appears to be too high level and self referential to be a useful picture of any portion of the reality, to be used as a guiding framework by those who deal with any kinds of data in their daily activities.

More fine-grained and domain-specific are the representations of the chains of actions and relevant products, actors, and mechanisms involved in creating, managing, selecting, and preserving records that were developed by the InterPARES 2 Project and are known as Chain of Preservation Model and Business-driven Recordkeeping Model.¹¹ As recently emphasized by Brothman,¹² these kinds of

⁹ Adrian Cunningham, “Digital Curation/Digital Archiving: A View from the National Archives of Australia,” *The American Archivist* 71(Fall/Winter 2008): 530-543. Citation is at pp. 534-535.

¹⁰ The DCC’s Curation Lifecycle Model is available at <http://www.dcc.ac.uk/resources/curation-lifecycle-model>. In the DCC Model, “data” is defined as “any information in binary digital form.” This includes:

“Digital Objects: simple digital objects (discrete digital items such as text files, image files or sound files, along with their related identifiers and metadata) or complex digital objects (discrete digital objects made by combining a number of other digital objects, such as websites);

Databases: structured collections of records or data stored in a computer system.”

¹¹ Both models are published as Appendix 14 and 15 respectively in the International Research on Permanent Authentic Records in Electronic Systems (InterPARES 2) Project book, available online at <http://www.interpares.org/ip2/book.cfm>.

¹² Brien Brothman, “Designs for Records and Recordkeeping: Visual Presentation in Diplomats, the Record Continuum, and Documentation Strategy,” in *Documenting Society and Institutions. Essays in Honor of Helen Willa Samuels*, ed. Terry Cook (Chicago: Society of American Archivists, 2011), 279–316.

visualizations of the recordkeeping function, which make use of the graphical language typical of engineers with the ill-concealed intention to sound scientific and objective, in reality embed and promote a particular way of approaching the matter, which is rather conservative. Both of the InterPARES models provide a rigorous representation of the ‘right’ way of dealing with records that comes down directly from a noble lineage of archival thinkers, and by doing so, reinforce the values, beliefs, and other cultural manifestations shared by those thinkers. However, the world has much changed since Jenkinson’s times. When tested against most of today’s recordkeeping situations, those abstract models may only work in relation to types of organizations that resemble traditional bureaucracies, while they have difficulty accounting for more dynamic and unstable workplaces.

All current attempts to frame and normalize organizational practices have certainly enriched our understanding of contemporary recordkeeping and have contributed to promote a common terminology and a set of core competences for information professionals, among other benefits.¹³ However, they have also reduced our ability to penetrate and to accept as admissible ‘deviating’ practices, or attitudes towards records and information that only appear to make sense to a relatively small group of practitioners. In other words, those ‘perfect’ models do not help explore actual and therefore complex situations. Additionally, because their design follows some engineering-like approach, those standards are hardly applicable to ill-defined problems, as most of the problems faced by information specialists tend to be.¹⁴

Current preservation concepts appear to have been developed having in mind the features of traditional bureaucratic institutions—also known as ‘full bureaucracies,’ or ‘pyramidal organizations.’¹⁵ Do the cultural assumptions embedded in those configurations still make sense when we examine today’s unstructured, or less structured, and more dynamic and flexible workplaces? Organization theorists have moved beyond the consideration of organizations as monolithic, full bureaucracies, and have identified different social groups within each organization and connected the latter to different ‘sub-cultures.’

The idea that organizations either *have* cultures or *are* cultures emerged as a dominant theme of management literature in the 1980s, when special issues devoted to it appeared in several organization and management research journals. This interest in corporate or organizational culture emerged in connection with a surge of popular interest in new models of managing organizations, and with attempts to explain the success or failure of organizations. In particular, excellence was equated with a ‘good’ or ‘strong’ culture.¹⁶ Soon, the concept of organizational culture had become mainstream, moving into related areas such as IS.¹⁷

¹³ See, for instance, the Records Management standards ISO 15489-1:2001 and ISO 15489-2:2001 issued by the International Organization for Standardization (ISO); the standards relevant to metadata for records ISO 23081-1:2006 and ISO 23081-2:2009; European Commission, *Modular Requirements for Record Systems (MoReq2010)* (2011), available at <http://moreq2010.eu/>; International Council on Archives (ICA), *Principles and Functional Requirements for Records in Electronic Office Environments – Module 3: Guidelines and Functional Requirements for Records in Business Systems* (2008), available at <http://www.ica.org/sites/default/files/ICA-Guidelines-Principles%20and%20Functional%20Requirements%20Module%203.pdf>.

The majority of approaches in IS research tend to view culture more as a variable property—something an organization ‘possesses’ and which can be objectively measured and manipulated—rather than viewing it as something an organization ‘is’ using in-depth interpretative and longitudinal methods. In the archival discipline (and particularly, in the area of digital preservation), the former appears to be the most popular approach. Studying organizational culture in this context mostly means to identify those attitudes to information that are in conflict with ideal recordkeeping practices, in order to neutralize them, or to minimize their impact, so as to facilitate the implementation of the ‘right’ preservation strategies. Our study considers records and information as socio-historical phenomena whose creation, use, and preservation reflects specific culturally shaped practices, and do not attempt to alter those practices.

3. Organizational culture: A layered view

There is no consensus on the definition of organizational or corporate culture. Edgar Schein’s definition—one of the most quoted—reads: “A pattern of shared basic assumptions invented, discovered, or developed by a given group as it learns to cope with its problems of external adaptation and internal integration, that have worked well enough to be considered valid and therefore, to be taught to new members as the correct way to perceive, think and feel in relation to those problems.”¹⁸ Based on their different visibility to the observer, Schein identifies three distinct levels in organizational cultures:

1. Assumptions (i.e., deeply embedded, taken-for-granted behaviour which is usually unconscious, but constitute the essence of culture);
2. Espoused values (i.e., the organization’s stated values and rules of behaviour, such as, official strategies and philosophies, explicit goals and objectives); and
3. Artefacts and behaviours (i.e., tangible, visible elements in a culture, which can be recognized by people not part of the culture, such as, architecture, furniture, dress code, procedures, records and other “genres of organizational communication”).¹⁹

Since assumptions are generally invisible and pre-conscious, and artefacts, although being more visible, are hard to interpret, most research that attempts to conceptualize culture focuses on “reference group value orientation, such as value dimensions of national culture, or competing values framework at the organizational level.”²⁰

Most recent studies recognize that culture involves several layers, or sub-cultures, and each distinct layer embeds assumptions, values, and practices in different ways. These various cultural layers interact dynamically and permanently to form an individual and an organization’s culture and to shape behaviour. According to Karahanna et al., “depending on the behaviour, different levels of culture will have a

dominant influence on an individual's actions.”²¹ They identified the following types of cultural layers or levels:

- Supranational, i.e., “any cultural differences that cross boundaries or can be seen to exist in more than one nation” (e.g., regional, ethnic, religious, and linguistic sub-cultures);
- National, i.e., “collective properties that are ascribed to the citizens of countries;”
- Professional, i.e., beliefs and practices shaped by education opportunities and acquired professional tenets (e.g., concepts, methods, code of ethics), and that imply a “distinction between loyalty to the employing organization versus loyalty to the industry;”
- Organizational, i.e., “the social and normative glue that holds organizations together;”
- Group, i.e., “cultural differences that are contained within a single group, workgroup, or other collection of individuals at a level less than that of the organization.”²²

The levels of culture are interrelated and can present several configurations. In the case of multinational organizations, organizational culture can span national, religious, ethnic, regional, linguistic, and professional cultures.

Values and practices are two critical components of culture. Values refer to relationships among abstract categories that are characterized by strong affective components and imply preference for a certain type of action. Typically, values are acquired early on in life through the family and neighbourhood, and later through education. They provide us with fundamental assumptions about how things are. Once a value is learned, it becomes integrated in a system of values where each value has a relative priority. Values and practices are intertwined and tend to affect each other. Both are continuously evolving—although values, especially those acquired during the formative years, are hard to change.

Karahanna et al. observe that supranational and national cultural differences are composed primarily of differences in values and, to a lesser extent, of differences in practices. Progressively, the balance between values and practices changes, and practices become a more predominant component of organizational and group cultures. Professional culture implies the acquisition of both values and practices, whereas organizational cultures are made primarily of shared perceptions of organizational practices and to a lesser extent of values. Ideally, practices should reflect values, but this is not always the case. Discontinuity typically occurs when practices dictated by one level of culture (e.g., organization) are at odds with values comprising another level of culture (e.g., professional). An individual whose professional culture is driven by a ‘preservation imperative’ (an archivist, for example) might find it difficult to perform his/her functions in an organization whose practices are detrimental to records preservation. It is not uncommon to witness cultural clashes within task forces or other kinds of ad hoc aggregations, as such groups do often include members from several work units, professions, nations, religions, etc.

As mentioned earlier, behaviour appears to be influenced by different cultural levels according to the task to be accomplished. Thus, practices that involve consideration of values (e.g., archival appraisal) will mainly be influenced by national and supranational cultures; while behaviours that consist primarily

²² Karahanna et al., “Levels of Culture and Individual Behavior,” 5.

of practice (e.g., records registration) will more likely be influenced by organizational, and group cultures. Digital preservation is a complex enterprise that comprises both technical and value-based components. It is important to distinguish the various tasks and responsibilities involved, so that the different cultural layers to be considered when planning and implementing digital preservation strategies can be clearly identified.

4. Defining information culture

Information culture is as difficult to define as organizational culture. Most definitions equate information culture with the values, beliefs, behaviours, practices, and attitudes expressing an organization's orientation towards, and use of information.²³ Information culture is inextricably intertwined with organizational culture and involves all the levels mentioned above. Information culture preoccupations emerged in the mid 1980s in the context of the failure of IS projects. These failures were often the expensive result of a misfit between the culture embedded in the technology and that of the adopting organization. It became clear that a technological infrastructure for flow and sharing of information is not enough to ensure success. According to Cabrera et al., successful technology assimilation requires either the technology to *fit* the organizational or subgroup culture, or the culture to be *shaped* to fit the behavioural requirements of the technology.²⁴ In any case, it is clear that values are embedded in both the information created and the associated technology, and that these values are assumed in the underlying work practices that the IT is meant to inculcate.

Most IS research has investigated the cultural factors influencing technology development, implementation, adoption, use, and diffusion. Only relatively few studies have addressed the cultural transformations engendered by the continuous use of a given technology. Leidner and Kayworth suggest that studies need to move beyond trying to use cultural values to *predict* whether or not a group will adopt a new technology to *understanding the dynamics of adoption*. "Culture"—they write—"is less instrumental in predicting whether or not an IT will be adopted than it is in predicting the time of adoption, breadth of diffusion, and the objective of adoption."²⁵ Furthermore, Ortiz de Guinea and Markus suggest that over-emphasis on reasoned action theories by IS scholars has resulted in imperfect understandings of the complexity of human behaviour.²⁶ The implications for preservation are clear. Values, attitudes and behaviours all come into play in a discordant cacophony which challenges the appropriateness of our 'perfect' solutions. We have therefore embarked on a research project to identify the components of information culture to enable the development of a culturally sensitive digital preservation agenda.

5. Research project description

The research into information culture introduced in this paper aims at increasing our understanding of two fundamental aspects of contemporary, information-driven organizations: 1) their information management approaches—i.e., their ways of using information resources “to answer a question, solve a problem, make a decision, negotiate a position, or make sense of a situation”²⁷; and 2) their information technology ‘appropriation’ modes—i.e., their processes of incorporating technologies (e.g., EDRMS, ECMS) into the organization’s work practices.²⁸ Both aspects have a bearing on the feasibility of preservation, preservation planning and strategies, and more generally, the meaning attached to the word preservation by different human groups. We believe that only through an empirical investigation of the cultural forces at play in the pre-ingest phase, digital preservation may become an applicable concept.

The knowledge of specific work environments gained through the initial stages of this research project—consisting in an analysis of the websites of multinational organizations and a global survey—will enable the planning of subsequent stages. In particular, it will help identify organizations that appear suitable for conducting on-site, ethnographic research. In combining survey and intensive fieldwork methods, this project seeks to overcome the methodological split that characterizes research on information culture. By merging a quantitative study of perceptions of information behaviors and practices²⁹ with an interpretive approach based on ethnographic study,³⁰ this research aims at minimizing the limitations inherent in either approach, thus obtaining a rich and multidimensional understanding of culture.

The choice of international and multinational organizations as a target for this study is related to the objective of moving away from considering national culture values as the main component or determinant of organizational culture, as emphasized in previous research.³¹ Given the trend towards globalization that is typical of any aspects of contemporary society, we thought that studying organizations that are multi-cultural by statute would be relevant to most of today’s workplaces. Additionally, it is a fact that private sector corporations are overall under-researched, especially by the archival and records management community. It is likely that corporate information management in these kinds of organizations, having less legal constraints and being more ‘personalized,’ will reveal attitudes and values to information that might be closer to personal information management types of behaviour, in terms of effectiveness and engagement. That is why we decided to focus on private and semi-public organizations.

The two main components of the initial stages of this research project (i.e., website analysis and survey development) are briefly described below.

6. Website analysis: Preliminary findings

This project component consists of a comparative analysis of the websites of several multinational organizations operating in the following industries: information products and services (namely, Google, Apple, and Microsoft), banking and finance (Deutsche Bank, HSBC, and JP Morgan), manufacturing (Tata, Hyundai, and Ford), publishing (Amazon and Springer), and non-profit charitable organizations (The Red Cross [IFRC] and Unicef). The goal of exploring the corporate culture projected by these companies is to get a grasp of their ‘espoused values,’ and to facilitate the selection of a few case study sites within each functional area identified. The questions guiding this study were:

1. What is the self-representation of each company’s organization culture, if stated?
2. What themes distinguish each company’s website, and what might that suggest about their organizational culture?
3. What kinds of information do they seek and provide?
4. What can one infer about the ways in which the companies manage their information and the values they ascribe to it?

Findings from the preliminary analysis of the websites of the information products and services companies and the financial services sector companies provide interesting insight into culture as projected. These findings are summarised below to provide a snapshot of the type of differences that can be detected in superficially similar organisations and that will ultimately play a part in influencing the choices made relating to the ways in which information is regarded and managed.

Google, Apple, and Microsoft, three corporations that are among the giants of software, hardware, and Internet applications and media, portray themselves in very distinct ways. While Google, a relative newcomer having only been founded in 1998 (as opposed to 1976 for Apple and 1975 for Microsoft), appears intentionally to project a corporate culture,³² Apple and Microsoft are much more traditional in the way they present themselves online. Aside from product searches and information about software and services, Apple offers very little corporate information to website users.³³ Microsoft is, in some ways, the midpoint between Google and Apple. Overall, whereas Google wants to project a trustworthy air to consumers, and Apple wants consumers to buy its products, Microsoft seems relatively confident that it is already structuring the technological experiences of most of its website’s visitors. Information about Microsoft’s governance and finances is, for instance, richer and better accessible than that provided by its competitors. Unlike Apple or Google, Microsoft’s primary financial report is presented in HTML format under investor relations, with links to more detailed information and yearly reports, as well as SEC files.³⁴

Three of the world’s largest banks, Deutsche Bank, HSBC, and JP Morgan Chase, have one characteristic in common, i.e., their ‘brand culture,’ which may be interpreted as pride in their history and exhibition of symbolic power. All three companies specifically recognize and speak of their own corporate culture. However, what each lists as constitutive of that culture is not very unique: each emphasizes earnings and stability with respect to finances, conducting business with integrity,

³² <http://www.google.com/diversity/index.html>.

³³ <http://www.apple.com/about/>.

³⁴ <http://www.microsoft.com/investor/CorporateGovernance/Overview/default.aspx>. SEC is the US Securities and Exchange Commission.

environmental sustainability, and social responsibility. All three companies list impressive accomplishments in terms of philanthropic endeavours, and their emphasis on environmental, social, and corporate responsibility is very prominent. Additionally, each reassures their potential and current clients and stakeholders that they are earning profit and well poised to meet any possible global financial turmoil. What seems to distinguish them is a preoccupation with what they think makes their bank the best: Deutsche Bank is convinced that their brand speaks for itself;³⁵ HSBC has spent more time than the others in predicting the future of global markets;³⁶ JP Morgan emphasizes their trustworthiness in that they have the best performing employees.³⁷

A comparative analysis of these two sets of websites will highlight cultural differences related to the distinct goals the industries pursue. However, it is only through further investigations into the actual attitudes towards information of the employees of the companies analysed that the characteristics of national, professional and group sub-cultures can emerge, and we can see beyond the superficial manifestations of organizational culture.

7. Information Culture Survey

This kind of close-up analysis, though still primarily quantitative, will be achieved through the online survey tool that we have developed and are now in the process of pilot testing. The purpose of the survey phase of the project is, again, exploratory, and is going to be complemented by means of in-depth, ethnographic research.

The questionnaire has sections on organizational and societal requirements to manage information (awareness and compliance with regulations and policies, formal/informal decision-making processes, etc.), information sharing, trust in information, and a series of scenarios where values/attitudes/practices are tested (e.g., value of documenting one's work [evidence/memory], belief in the technological fix of every problem, engagement with information-related tasks, feelings towards mobility and online access provided by the new digital technologies—in most scenarios, individual assumptions are confronted with organizational/management assumptions). The objective is to get a sense of the values, beliefs, practices that management and staff of the study organizations associate with information, and their perceptions of the role and effects of information and its management on their daily work and on the organization's operations. We are interested in the views of employees working in all organizational departments and performing a variety of functional roles, not just those in charge of records-related functions.

Data will be analysed by applying primarily, quantitative statistical methods. The measurement of different cultural characteristics and the identification of possible factors responsible for such characteristics will be used to formulate initial hypotheses to be used in subsequent research phases.

8. Conclusion

Existing models and approaches to digital preservation have enabled much progress to be made in developing the necessary technological strategies and systems. However, the messy and difficult factors

³⁵ http://www.deutsche-bank.de/en/content/company/mission_and_brand.htm.

³⁶ <http://www.hsbc.com/1/2/about/advertising>.

³⁷ http://www.jpmorgan.com/pages/jpmorgan/about/culture_new.

that people bring to the mix have only partially been taken into account and the risks involved have been over-simplified. By employing a situated, empirical approach, and by leaving aside any prescriptive purposes, our research into cultural characteristics and relevant factors aims at mapping the digital landscape and identifying the different needs of any stakeholder involved. Understanding and applying the information culture concept will enable the development of a culturally sensitive framework for digital preservation.

The envisaged framework will celebrate diversity and idiosyncrasy of approaches. It will not assume that the 'right' way of doing recordkeeping should be imposed in order to correct 'deviating practices'—which we would rather call 'innovations.' Actual uses of information artefacts, perceived values, and concrete appropriations of relevant technologies will be examined in depth, so that individual, specific, socially and historically situated 'preservation cultures' can be described and used as a basis for action.

Political, Cultural and Professional Challenges for Digitization and Preservation of Government Information in Papua New Guinea

An Overview

Tukul Sepania Walla Kaiku and Vicky Puipui

Abstract

There are political, cultural and professional challenges for the digitization and preservation of government information in Papua New Guinea. First and foremost of these challenges is that digitization and preservation of government information is not a national government agenda. Some other challenges relate to struggles by individual government agencies for a correct definition, understanding, inference, usage and application of the terms digitization, and digitization and preservation. An examination of such challenges should contribute to resulting determination, discussion and a national agenda for digitization and preservation of government information in Papua New Guinea. It is envisaged that the overview serves as a means to attain UNESCO's proposal for the conference to explore the main issues... "affecting the preservation of digital documentary heritage, in order to develop strategies that will contribute to greater protection of digital assets and help to define an implementation methodology that is appropriate for developing countries, in particular."

Authors

Mrs. Tukul Kaiku is a lecturer in Information and Communication Studies at the University of Papua New Guinea. She worked with the Papua New Guinea National Archives and Public Record Services from 1983-1997, the Department of Provincial and Local Government Affairs from 1997 – 2001 and the Public Sector Reform Management Unit of the Department of Prime Minister and NEC from 2002-2004. Her interests are in the areas of Indigenous Knowledge systems and Cultural Documentation.

Ms. Vicky Puipui is acting National Archivist with the National Archives and Public Records Services of Papua New Guinea. She began work with the National Archives in 1993. From 2005-2010 she was in charge of the Lae Branch of the National Archives until recalled to National Archives Headquarters in 2011. She has attended training in Malaysia in Records Management and international conferences in Record and Archives Management.

1. Introduction

In this paper, the immediate issue of contention is that Papua New Guinea as a nation state is struggling in terms of digitization and preservation of government information of cultural and historic significance and heritage. Hence, this overview of political, cultural and professional challenges for digitization and preservation of government information in Papua New Guinea, in which are highlighted inferences, usage and application of the term digitization. Also highlighted are current digitization and preservation projects by selected government agencies as well as references to government information stored in selected cultural institutions. A conclusion will leave off with a summary of the points discussed in the paper whilst a set of recommendations provides a list of suggestions for consideration in view of UNESCOs proposal for the conference.

2. Papua New Guinea

Papua New Guinea is a developing country and nation state located in the Pacific region. It consists of a main island which it shares with Indonesia and outer islands and atolls and is located north of the continent of Australia. The names Papua and New Guinea are respectively credited to European explorers who sailed by and sighted the mainland and islands of Papua New Guinea in the 1500s.

The people of Papua New Guinea are known as Melanesians with skin colour ranging from light brown to dark brown. Prior European sighting, initial contact and colonization, societies coexisted with the natural environment resulting in a state of rich interaction between nature and man. Today, there are more than 800 cultural linguistic groupings each with their own knowledge systems and traditions. Much of the indigenous knowledge systems remain undocumented.

The country went through a chequered history. It was administered by three colonial administrations, Britain, Germany and Australia, went through a war turbulent period during the Pacific War of 1942-1945 and attained political independence in 1975.

At independence in 1975, the country assumed all administrative activities, as legacy of Australian rule, with a Westminster system of government and a national parliament, a Governor General, a Judiciary and an Executive Council and Bureaucracy consisting of government departments and agencies. The country currently has a three tier government system, a national level government and national parliament, twenty-two provincial governments, three hundred and fourteen Local-level Governments (of which there are urban and rural) each of which consists of wards. There are also districts within each province of which there are 89 such. Each of these layers of governments and administrations produce records.

Most government departments in Papua New Guinea create and receive records. In this discussion, we limit the scope of government information to those of significant cultural, social and historic value. These records are held in agencies such as the Papua New Guinea National Museum and Art Gallery and include cultural artefacts of various societies of Papua New Guinea. The Institute of Papua New Guinea Studies holds sound recordings, literature and photographs; documentary heritage of societies of Papua New Guinea. The National Broadcasting Corporation holds sound recordings pertaining to songs and dances and speeches the significant speech being that of the announcement and declaration of Independence by former Governor-General Sir John Guise. The National Archives and Public Records Services of Papua New Guinea holds government records from 1883 for British New Guinea and Papua and post war records of the country. The Papua New Guinea Patrol Report which spans from 1886 and works by government anthropologist, Francis Edgar Williams are among those records of national significance also housed at the National Archives and Public Records Services. The FE Williams papers have in fact been registered as a Memory of the World Collection. The Michael Somare Library at the University of Papua New Guinea holds unique literature materials of the country including the proclamation of British New Guinea on 6 November 1884.

2. Digitization, what is it really all about?

There is a need for a clear definition of the term digitization. In the meantime, inferences, usages and applications of the term digitization are widespread in literature and online discussions. One online source¹ for instance defines digitization as ‘Conversion of analogue information in any form (text,

¹ <http://www.businessdictionary.com/definition/digitization.html#ixzz23yLENnPI>

photographs, voice, etc.) to digital form with suitable electronic devices (such as a scanner or specialized computer chips) so that the information can be processed, stored, and transmitted through digital circuits, equipment, and networks.’ Here the inference is in the application of the term digitization, where computer hardware technology such as flatbed scanners or a slide projector, tripod, and digital camera and software are used to capture analogue information. Images of texts or photographs such as printed photos or taped videos and other images are replicated and converted into an image file such as a bitmap and off loaded either into a computer hard drive or external drives or as JPEG image onto a web page. Hence, in general digitization is the usage and application of computer technology hardware and software in and for the production of digital copies, representations or versions of information held either in texts or symbols and or sound or audio and or photographs and pictorial works or artwork and or film or images and texture maps or such other 3D objects.

The discussion by Roberts² is one which wraps up the concept, inference, usage, application and context of digitization. In his discussion, digitization is an imaging technology used in archives work alongside micrographics technology. It is a recent reformatting and an alternative imaging technology which offers a range of benefits, including integration with other uses of information and communications technology. As an imaging technique, digitization involves a host of activities as Roberts³ discusses.

Digitization involves defining of the purpose and benefits of digitization for its long-term gains including funding and the purpose for digitization, whether for protection and preservation of original records, or to make the records more accessible where these can be easily found for use, and thirdly for security purposes in case of loss.

Records to be digitized for preservation reasons are those which are in poor physical condition and those at risk such as being fragile and those that are frequently requested or used. Those for easy access and use include popular materials such as photographs and other pictorial materials which are appealing and have wide interest, records for inclusion in interpretive products such as online exhibitions etc, discrete groups with a flair of a project. Those for digitizing for security purposes include records with great iconic value or significance to their creators and or archives, those which have high monetary value and or those which are rare.

Specific technical requirements and considerations include technological equipment including hardware and software to use on the one hand, and the objects to be digitized, colour and pixel depth to use and so on are taken on. The question of optical character recognition (OCR) to ensure the digitized copy can be read, searchable, edited and or published with the use of an electronic device, technical specifications are further sought. Also established are benchmarks or the setting of quality standards such as outputs and outcomes to be attained from the project. Planning and management of a digitization project takes on critical questions such as who is to undertake the digitization project, at what cost and where and how.

Those objects and or materials to be digitized must undergo preparations such as, cleaning and repair of materials to be digitized, ensuring materials are in correct order, identification of materials which may require special treatment and types of formats of materials. Even, identification of special equipment such as cradles, preparation of instructions for staff, moving materials safely and securely to digitization location, setting up suitable location and space for materials undergoing digitization,

² David Roberts, “Digitisation & Imaging,” In *Keeping Archives*, 3rd ed., ed. Jackie Bettington, Kim Eberhard, Rowena Loo, and Clive Smith (Canberra: Australian Society of Archivists, ACT, 2008), 402-434, .p. 402.

³ Ibid.,” pp. 402-434.

preparing of targets and rulers to indicate size and clarity of items, establishment of a file-naming structure or protocol for image files from the project. Of course the total number of items must be accounted for to ensure none is missing.

For image capture, questions to take into account are those such as types of equipment for use to regenerate digital copies of other items or records. For instance equipment such as a flatbed scanner where materials are placed face down on a glass plate for scanning and digital cameras. As well, are processing software such as Adobe Photoshop, etc., to absorb the image.

The task of metadata capture involves capturing and maintaining information about the images to provide and assist users to find and use the digital records which were copied, and to support the documentation process for the management of the digitized records, either internally or externally

Considerations in relation to quality assurance ensure quality of imaging and data capture meets the requirements set for a digitization project while management of digitized archives is concerned with ongoing work to ensure special care, special storage requirements and periodic maintenance and monitoring take place. And finally, the output and outcome of digitization ensure availability, access and use of digital records either online and or replicated CD or DVD or paper copies.

Clearly as alluded to above, digitization is a venture that involves a host of activities including careful planning and identification of those analogue materials to be digitized and the type of technological equipment to use as well as the outcome of such a venture.

3. Political Challenges

Given that digitization is a formatting technique which has reached the shores of Papua New Guinea, the following political challenges are highlighted in view of political and administrative arrangements for coordination and management of government information resources at national, provincial, district and local-level government levels.

A cascading political and administrative challenge at national level is the need for management of government information to be a national agenda. Currently it is not. Compounding this challenge is the issue of the lack of a central coordinating agency responsible for overall coordination of government information. This observation is also seen in the guise of a number of agencies of government and stakeholders who are operating in isolation from each other. Collaboration and partnership between government agencies that manage and have an interest in government information is absent. For now the agencies that fall into this category include:

Department of Communication and Information, National Archives and Public Records Services of Papua New Guinea (NAPRS), National Information and Communication Technology Authority (NICTA), Department of Personnel Management (DPM), Department of Provincial and Local Government Affairs (DPLGA), Papua New Guinea National Museum and Art Gallery (PNGNM&AG), National Cultural Commission, National Statistics Office. PNG Electoral Commission, , Information and Communication Studies Strand and the Michael Somare Library both of the University of Papua New Guinea, Department of National Planning and Monitoring, Department of Community Development and the Papua New Guinea UNESCO Office. As well there are twenty two provinces, eighty nine districts and three hundred or so Local-level Governments and six thousand Local-level Government Wards across the country.

In the absence of a coordination mechanism and framework at national level, government agencies have been left to do their own thing. To fill the void vendors and or donor agencies who see a need for

digitization step in. For instance, the digitization of sound recordings of the National Broadcasting Corporation in 2007 by an Australian Aid funded consultant, the Digitization Project of the Mineral Resources Authority of 2008 by the World Bank and more recently, the Digitization project for the Department of Agriculture and Livestock Land Use Files by the Australian National University.

Another political challenge is the need for establishment of necessary information infrastructure, purpose built buildings, network facilities and connections, equipment and staffing at provincial, district, local-level government and local-level government ward levels. Currently, there are twenty-two provinces, eighty-nine districts and at least three hundred and fourteen Local-level Governments. Each of these entities have no purpose built records or archival facilities for the storage and preservation of government information resources.

There is also need for legislation and national policy on digitization and preservation and National Standards on digitization and preservation of government digital information. Currently there are none in place.

The status of the National Archives and Public Records Services is one political and administrative challenge. Currently, the National Archives and Public Records Services of Papua New Guinea is a Branch of the National Library Services of Papua New Guinea with the Office of Libraries, Archives and Literacy (OLA). As well, the post of the National Archivist is below that of the National Librarian and instead is equivalent to that of a Branch Head of the National Library Services. The National Archives needs to be elevated to a level such as that of an Authority or Department with a professionally qualified Archives Administrator and an equally professionally qualified staff capable of formulating and developing policy guidelines and standards for archival practice including digitization and preservation.

4. Cultural Challenges

The following cultural challenges are in view of the concept of imaging and or digitization and preservation of government information of significant national and cultural value for national heritage, research and preservation purposes. This is in view of Roberts discussion above where digitization is an imaging technique for preservation of those records which are in poor physical condition and or those at risk such as being fragile, and those that are frequently requested and or used as well as popular materials such as photographs and other pictorial materials which are appealing and have wide interest and so on.

The Institute of Papua New Guinea Studies out of their own initiative in 2010 embarked on digitizing photographic negative film strips of photographs of people from various areas of the country using HP Standard scanner and a Desktop computer. The intention was to scan the negative film strips with a view to maintain the original quality of the photographs. The scanner setting was set at default mode with the required quality output displayed on the desktop computer screen. The outputs of the scanning procedure were JPEG format photograph copies saved in an external hard disk drive. The originals were in turn stored in archives storage boxes at the Institute of Papua New Guinea Studies mini archives. The staff member who undertook the project was a trained records and archives graduate of the Information and Communication Studies Strand at the University of Papua New Guinea who knew what to do, hence no major hassles were encountered.

Some challenges in this project included imaging limitations where the scanner used was able to only scan about four to five negatives at one instance. The project was able to scan photographic film strips captured with camera equipment that no longer exist. The possibility of viewing the images on film strips was minimal and the scanning project (a reformatting one) made it possible for the images to be

converted to JPEG images which for now can be useful government information resources for researchers and possibly future generations.⁴

The National Broadcasting Corporation, the Voice of Papua New Guinea is a Radio station which is embarking on digitization under the auspices of AusAID, an Australian government Aid Agency. Theirs is a case of enhancing sound recordings by digitizing tapes to computer disks. A graduate of the Information and Communication Studies Strand is the Archivist on location in this organization and an assistant is capturing and compiling metadata for those recordings.

Other cultural challenges include the need for digitization and preservation projects for other government information resources. For instance, the collections of the National Museum and Art Gallery, the Francis Edgar Williams Photographs which have been included in the Memory of the World Register and the PNG Patrol Reports are some government information resources needing to be digitized for enhancing of the images and possibly newer, cleaner and clearer paper copies.

5. Professional Challenges

The following professional challenges for digitization and preservation of government information in Papua New Guinea are in view of the question of what digitization actually involves as presented in Roberts discussion above. These challenges are in relation to the need for a clear understanding and definition of what digitization and preservation are all about and the purposes and other considerations involved in digitization.

One professional challenge for the digitization and preservation of government information in Papua New Guinea is the lack of a Digitization and Preservation division within the National Archives and Public Records Services establishment. Currently, there is none. There is a need for a Digitization and Preservation division with qualified staff to oversee, facilitate and coordinate digitization and preservation of government information projects and programmes across government. The staff will be qualified professional staff in records, archives and digitization and preservation training.

Training is a professional challenge. There is need for training of officers in digitization and preservation practice. Staff in areas requiring digitization and preservation must be those with digitization, records and archival training qualification. This is necessary for proper understanding and identification and systematic control and documentation of those records which will undergo digitization. It was found for instance during the digitization and preservation project of the Department of Agriculture and Livestock that records selected for digitization initially had no file listing for individual folios. A whole book or file would have been scanned without the minute details such as individual folios or page and metadata capture would undoubtedly be a nightmare exercise. The Department did not have a records manager or an archivist. During the digitization project, the contents of each file were not itemized or listed and would have been copied without such an itemized list of such⁵

Another professional challenge for digitization and preservation of government information would be that of the need for a database and inventory of government information resources. There is a need for a survey of government information types and where these are held and which are candidates for digitization and preservation. For instance, there are government information resources of national and cultural significance such as the Proclamation of British New Guinea Protectorate of 6th November 1884

⁴ Robert Natera, questionnaire response, August 20, 2012.

⁵ Vicky Puipui, in an interview July 10, 2012.

held at the University of Papua New Guinea Michael Somare Library. Also there is a tape containing the declaration and announcement of the newly independent state of Papua New Guinea by then Sir John Guise at 12midnight of 16th September 1975. This tape is at the PNG National Broadcasting Corporation. Photographs of the lowering of the Australian flag on evening of 15th September 1975 and raising of the newly independent nation state of Papua New Guinea flag on 16th September 1975 are at the National Archives and Public Records Services of Papua New Guinea. These documents of national historic significance need to be identified and a database to be kept of such..

Digitization and preservation inferences are also professional challenges. Currently, inference, usage and application of digitization and preservation are inadequate and there is a lack of a working definition and understanding of what digitization and preservation entail. A number of cases attest to this:

The first case in point is where digitization and preservation have been assumed to be solutions for easy access and fast retrieval of information. In this case, a certain government agency⁶ with insistence by vendors and donor consultants pulled together active and semi active personnel files from other geographical locations to the national headquarters for the purpose of digitizing such. The idea was to have details of staff in a system in order for personnel information to be easily and readily available in a computer system instead of staff section personnel of the department having to wade through manual paper-based information to search for information. The files were brought to headquarters, lists were not in order, equipment was purchased but there were no qualified persons to conduct the digitization project. The donor agency project also wound down. The files had to be placed in a shipping container for four years and this year had to be relisted and placed into nine hundred standard archives boxes and transferred to the National Archives and Public Records Services. Another agency where digitization has taken place with the intention for information to be in a computer system for easy access and retrieval originally had no lists to the files and records and in the process of digitization, the records were organized into chronological order and scanned/In so doing certain provenance details of the records were disregarded..

Another case in point is in relation to software and hardware vendors. There are cases where vendors are prompting and pushing government agencies into digitization projects. In most instances, the records of some department are not in any systematic order due to poor or nil records management system in place. Currently, one government agency is digitizing its records for the purpose of space saving.

In general, professional challenges here have been limited to the inference, usage and application of digitization and preservation and in most instances, the challenges are in relation to a lack of understanding of the purpose for digitization and what digitization involves. In so doing there is not clear picture and no systematic approach to digitization and preservation

6. Conclusion

Government information in Papua New Guinea comprises records of its historic colonial past and state of nation hood including its cultural documentary heritage and cultural artefacts. Digitization has come to Papua New Guinea, however, there is a need for a definition of digitization for inference, usage and application in Papua New Guinea. Papua New Guinea needs to rise up to the challenges and benefits that can be derived from the application of digitization as an archival reformatting technique and technology. Political, cultural and professional challenges exist in Papua New Guinea for digitization and preservation

⁶ Known to the authors.

of government information. Government agencies need to understand what digitization and digitization and preservation are all about and for government to rise up to the challenges of digitization as a technological invention even if the benefits are those to serve scientific, education and developmental needs of the country and its people.

7. Recommendations

In view of the overview of political, cultural and professional challenges for the digitization and preservation of government information as presented above, the following broad recommendations are proposed for initial attention and action:

1. An agency to coordinate management of government information to be identified by government
2. For a Government Information Task Force or Committee to be established to comprise members of those government agencies and others including the PNG UNESCO Office who have an interest in the area of Information Management and for the Task Force. And for this Government Information Task Force or Committee to coordinate and oversee various aspects of management of government information in Papua New Guinea.
3. For the roles and responsibilities of stakeholders of the Government Information Task Force or Committee including the PNG UNESCO Office to be defined and for the Task Force to take into account some of the challenges discussed in this paper and to build an issues discussed in this paper
4. For the status of the National Archives and Public Records Services of Papua New Guinea status to be upgraded to an Authority Status for it to play an active role as venue for coordination of government agencies in matters of management of government information including digitization and preservation of government information.

Abstract

There are a large number of precious historical documentary resources standing for the long history of the Chinese nation, which are of great significance for human civilization. In recent years, the digital preservation of the documentary heritage has made great advances, but there still are many problems. It is argued that the current situation and problem exists in China, which suggests the need for improved documentary heritage preservation in China. Achieving this will require that we constantly improve the laws and regulations, strengthen the research of the theory and practice, pay attention to personnel training, broaden the financing options, expand the digitization category of the documentary heritage, and strengthen the database construction of the documentary heritage preservation in the future.

Xincai Wang is Professor and Deputy Dean of School of Information Management, Wuhan University, Commissioner of Teaching Guidance Committee of Archival Science of Institution of Higher Education, the Ministry of Education of China, PR China. Research fields include Archival Preservation and Information Management.

Yunxia Nie is a Ph.D. candidate in the School of Information Management, Wuhan University, and a Lecturer at Nanchang University, PR China. Research fields include Archival Preservation and Information Management.

1. Preface

The General Conference of UNESCO (United Nations Educational, Scientific and Cultural Organization) approved the Recommendation for the Protection of Movable Cultural Property (hereafter Recommendation) at its twentieth session on November 28, 1978. As the Recommendation points out, “Except for the immovable cultural heritage, the cultural heritage also includes the documentary forms of movable objects, which means the documentary heritage as the recording and transmission of knowledge and thinking, such as paper archives, photos, films, tapes, machine-readable records and manuscripts, ancient version book, ancient manuscripts, modern books and other publications of special significance.”¹ Based on the recommendations and the efforts of the International Council on Archives (ICA), the Memory of the World List was founded by UNESCO in 1992. Meanwhile, the Memory of the World Programme was launched as a way to preserve the world’s documentary heritage, which includes manuscripts, archives, books and oral history that are deemed to be of such significance and common value to the world’s cultural heritage.

¹ UNESCO, “Recommendation for the Protection of Movable Cultural Property,” http://portal.unesco.org/unesco/ev.php?URL_ID=13137&URL_DO=DO_TOPIC&URL_SECTION=201&reload=1203999345.

“Documentary heritage” is a specific concept in the Memory of the World Programme, but not as a depository institution of a certain type. Chapter 2 in the “General Guidelines to Safeguard Documentary Heritage” (UNESCO, 2002) points out, “It is usual to think of documentary heritage being kept in the museums, archives and libraries, but the Memory of the World is not defined by institutional types or professions. The heritages may exist in a variety of social and communal frameworks with a close relationship between them, which may have an effect on the ongoing survival, safety and use of the heritages.”

Providing advanced preservation strategies for the world’s digital heritage using digital technology is the main focus and task of the Memory of the World Programme. We should make full use of digital storage media to accelerate the documentary preservation process in China, such as disk storage, CD storage, database storage, etc.² Digitizing the country’s documentary heritage is the strongest tool to promote the national culture and to showcase it to the rest of the world. This paper explores the current situation and the problems, and suggests some measures for documentary heritage digitization.

2. The Current Status of Documentary Heritage Preservation in China

The digitization of the world’s heritage was launched by UNESCO in 1992, aiming at preserving permanently the world’s cultural heritage for the use and enjoyment of all. In the 1990s, Europe and America, Japan and other countries had carried out the digitization work of their cultural heritage. For example, the French government made construction of the information network an emphasis, and made full use of the digital resource in teaching and tourism. The America memory programme digitized 5 million documentary items, and provided plenty of information.

In view of the success of digital technology in the field of preservation of foreign documentary heritage, while forced by the huge pressure of the current situation of the preservation of the documentary heritage in China, digital preservation is becoming common practice. As well, the increasing development and popularity of digital technology and network technology has spurred interest in the digital preservation of the documentary heritage in China, which is manifested as follows.

Firstly, the large collection of digitized resources. As the main storage places in China, libraries and archives are good at digitizing the collection. Taking the National Library of China for example, its digital resources amounted to 561.3 TB by the end of 2011, including 466.8 TB of special resources, which accounts for more than 80% of the total collection. And the National Digital Library of China has already been established and is being enriched and perfected constantly. At the same time, the National Digital Archives of China is under steady construction.

Secondly, the digitization of local documentary heritage is emphasized. At present, the National Library system provides a public platform that integrates all parts of cultural information resources in China for all the people in the world to gain access to the local documentary heritage via the National Cultural Information Resources Sharing Project. This project provides online access to a precious documentary heritage that was once secret. For example, the Stele Forest of Beijing Dongyue Temple has already been scanned into the multimedia resource database collected by the Capital Library, and readers can access and research these resources on the library’s LAN.

² Kaifang Tian, “Preservation of the Memory of the World Programme and the Documentary Heritage,” *Information and Documentation Services* 6 (1995): 42. [authors’ translation of original Chinese source]

Thirdly, the digital preservation of minority documentary heritage has been achieved. Since the 1980s, computer operating systems, character recognition systems, font standardisation efforts, etc., have made great progress in the field of the national characters in China. During the years 1997-1999, the international standards of code character sets of Tibetan, Mongolian, the Yi language, Uygur and Kazak were formally introduced into the international code system.³ These achievements are the solid foundations, which make the digital preservation of the minority documentary heritage possible.

There are network columns for the conservation of ancient books in Tibetan and ancient books in Xinjiang at the digital unit of the Conservation Network of Ancient Books constructed by the National Library. And there are many precious minority documents from the three open batches of the List of Archives Documentary Heritage in China, such as the ancient books of Naxi Dongba, the Guizhou “water book”, the Yi Archives, etc., which will be digitized in order to be protected further. As regards laws and regulations, the National Archives formulated and released the interim provisions of the software functional requirements for archives management in 2001, which were the basis and the reference for the functional design and relevant data format for the digitization system of the minority history archives in Yunnan.

Fourthly, there are great achievements in the digital preservation of precious documentary heritage. Through the efficient use of computer and network technology, the most precious documents have been digitized, and mass databases have been established in order to share these invaluable documentary resources. For example, the digital resource of the Conservation Network of Ancient Books has set up a database of the ancient Chinese books, which is accessible worldwide via the Internet, and has also set up navigations for the ancient books bibliographica. And there are network columns of the ancient books, Dunhuang documentary heritage, and the world of the oracle bone in the special database of Chinese Memory. People anywhere in the world can now easily access this documentary heritage at the click of a mouse button. Virtual Reality technology has been used to protect the cultural heritage, such as the 3D digital project of Longmen Grottoes, which is cubic and impressive. During the process of documentary heritage digitization, the precious original documents have been protected, and the information level and the utilization ratio of the documents have been promoted by establishing the network and database, announcing the dynamic information, offering the digital documentary resources, disseminating the knowledge of the documentary heritage, publishing the expert database of preservation, sharing experiences and successful cases, and linking to the world memory web portals.

3. The Problems of China's Documentary Heritage Preservation

As far as it goes, the documentary heritage protection in China has made unprecedented achievements; many precious artefacts have been salvaged and preserved, which has made an important contribution to inheriting and sharing humankind's cultural heritage, and has also aroused concern for the protection of documentary heritage. However, as a coin has two sides, at the same time, the existing problems or inadequacies cannot be ignored.

³ Jian Gong, “Summary of the National Information Resource Researches Recently,” *Modern Intelligence* 10 (2007): 208-211. [authors' translation of original Chinese source]

3.1 Poor preservation of current status

There are abundant and historical documentary heritage artefacts in China. During the of the reform and opening-up, documentary heritage preservation has been effectively strengthened, especially in recent years. With the promotion of the “Memory of the World Programme,” documentary heritage preservation in China has made great progress, such as the Memory of China Archive Documentary List. Nevertheless, the overall situation is not optimistic. Take the archives department with better custody conditions, for example. Some precious historical archives are suffering from varying degrees of damage due to age and other reasons. Some have been endangered, manifested by archive documents that suffer from mildew and rot, boring insects, creases, paper adhesion, yellowing, fading text, brittle and crumbling paper and so on. According to the National Archives’ statistics, by 2005, there were more than 280 million volumes (pieces) in the National Archives. However, it is estimated that there more than 3300 million volumes (pieces) of historical archives formed before 1949. At present, the number of nationwide crucial archives that need salvage and preservation is 1200 million volumes (pieces),⁴ and many of them are considered precious archival heritage. Another example is the precious ancient maps of China’s territory and terrain, with varying degrees of damage amounting to 45.7% of the total, and in which serious damage occurs in 30%. Some ethnic minorities’ archives are endangered or have already been destroyed.⁵

In addition, according to incomplete statistics from libraries, museums and document collection units, Chinese ancient books amount to more than 27 million. In addition to these national collection units, individuals and temples also hold a large number of ancient books. Due to reasons of environmental pollution and human factors, the extent of ancient acidification and embrittlement has accelerated. In the National Library, since the 1960s, due to the increase of acid rain, the situation had been deteriorating. A recent survey shows that the average pH value of Ancient Books in the National Library was reduced to 6-6.5 from 7-7.5 in the 1960s.⁶ As is well-known, once the pH value drops below 5, books become ‘dead bodies,’ and cannot be used again. A large number of precious documentary resources stored by individuals and temples succumb to such phenomena as loss, discarding and burning; in addition, the constraints of custody and environmental conditions make the preservation status quo worrisome.

3.2 Unsound system and rule for preservation

Currently, China has no authority dedicated to documentary heritage preservation standards and management systems, and there is a lack of a national long-term preservation strategy. As well relevant laws and regulations are not perfect. There is only policy to encourage the declaration of documentary heritage, but no detailed reward and punishment system or national policy framework. Compared to foreign efforts, many countries have clear and overall strategies about cultural heritage development and preservation together with science and technology development planning. For example, the “Wealth plan to save the United States” and “National plan of protecting US” proposed by the U.S. government, which aim to stimulate public concern about cultural heritage, strengthen peoples’ regional geographic identity, pride and sense of participation, and thus save the past and protect the future. The French launched the

⁵ Yuejin Tang, “Thought about China Archive Documentary Preservation,” *Archives Science Bulletin* 5 (2007): 31-34. [authors’ translation of original Chinese source]

⁶ Center of National Ancient Books Preservation, <http://news.sina.com.cn/c/2007-05-25/134413075968.shtml>.

“National planning of cultural heritage (technology) research” programme. Funded by the government, this programme involved 53 research groups focused on scientific research on technology, theory, basic research and protection strategies.

On the other hand, the evaluation system is imperfect, and is mainly reflected in assessment indicators that are too extensive. Promulgated by UNESCO, the Guidelines are the implementation of the basic outline of the Memory of the World Programme. China also initiated the China Archive Documentary Heritage Programme in 2000, and then formulated the Selected Rules of China Archive Documentary Heritage. Although the Rules identify seven selection standards—time, region, nation and character, form and style, systematic, and rarity—the assessment indicators are still too extensive. And the Rules only relate to the first-level assessment indicator of documentary importance, such as the “Subject” of indicators reveals that “under normal circumstances, the archives have great value which reflect the development of productive forces, production and technological progress and the major scientific discoveries and invention, and which involve the significant change of relations of production, economic system and political system in various historical periods, and which reflect the typical significance of some major events of a certain stage of development in the history of China in political, economic, military, culture, diplomacy, science and technology, social life.”⁷ Among them, terms such as “significant change”, “typical significance”, and “symbolic” are fuzzy and difficult to grasp in actual meaning. Another example is the “rarity” indicator. “If the documentary heritage is unique, particularly rare,” this implies that it apparently has high value; however, the phrase “particularly rare” is a vague expression and not conducive to specific action. Secondly, the selection field is relatively narrow. China’s documentary heritage is selected by the National Advisory Committee of the China Archive Documentary Heritage Programme. The Committee is composed of well-known academic experts of documents, archives, ancient books, and history, according to the Selected Rules of the China Archive Documentary Heritage Programme. However, of the 113 selected documentary heritages, nearly 90% belong to archival types; non-archival documentary heritages from libraries, museums and other institutions are extremely limited. To a large extent, adding the word “archive” results in public misunderstanding of the documentary heritage list, as it limits the scope of a declaration and leads to the absence of precious documentary heritage that is stored in our libraries, museums and other places, including a large number of precious books or early, classic, block-printed editions. These include manuscripts, such as *Zhaochengjincang*, held in the National Library, *Manichaeism manuscripts of Tang Dynasty*, *Heavenly Creations of Ming Dynasty*, copper typed *Imperial Past and the Present integration of Qing Emperor Yongzheng*, the oldest official set of Confucian books engraved onto stone tablets, the *Xiping Stone Classics*, the silk book “Lao-tzu” of the Han Dynasty, the Art of War Residuals in Linyi Yinqueshan Han Tomb, and so on. The absence of these precious documents creates an obstacle for the further improvement of the documentary heritage list.

According to the UNESCO Guidelines, most of the world’s documentary heritage exists in libraries, archives, museums or other places. However, a lot of the documentary heritage appearing in the Memory of the World List is non-archival and comes from libraries or museums. For example, the “Gutenberg Bible” is Europe’s first lead movable-print; “*BaegunHwasang Chorok Buljo Jikji Simche Yojeol (vol. II)*” is the oldest existing movable metal print in the world.

⁷ XinCai Wang and Wen Li, “Analysis on the Importance Evaluation of the Chinese Literature Heritage,” *Journal of Macau Documentation and Information* (2011) :4-9. [authors’ translation of original Chinese source]

To some extent, as a national list that corresponds to the Memory of the World Programme, the standard of the Memory of China Archive Documentary Heritage List is far from the inclusion standard of the Memory of the World Programme, and thus is insufficient for the digitization of China's documentary heritage.

3.3 Shortage of personnel training

China's personnel training structure for documentary digital preservation is not adequate; the students' knowledge structure is singular, teacher resources are weak and there are temporary shortages. Examining the personnel training of digital preservation for archives, there are fewer than 20 persons in the universities and colleges in China, according to the survey. The teaching content is mainly about traditional paper documents rather than the digitization of archives, which results in students who, after graduation, often are at a loss as to what to do once faced with requests for the digitization of archives.

As a matter of fact, the digitization personnel are not professionally-trained, and they have not received systematic education on documentary digital preservation. In addition to constraints resulting from age, the knowledge structure and the education level, a labour shortage emerges in the field of documentary digital preservation. Furthermore, the work of documentary heritage digitization is monotonous and arduous, and work-place treatment is relatively poor, which often makes the experienced workers eager to leave. Therefore, talent shortages are the main obstacle restricting the fast development of documentary heritage digital preservation in China.

3.4 Weak preservation awareness

In the practical work of documentary heritage preservation, lack of awareness of digital preservation is reflected at both the macro and micro levels. On the macro level, the society as a whole lacks understanding of the documentary heritage, and preservation awareness is weak. Thus, a good environment for protecting the documentary heritage has yet to be created. The micro level refers to the documentary heritage workers who do not follow digital preservation rules strictly, such as ignoring the control of temperature and humidity, and neglecting the impact of polluted air and magnetic interference, all of which are bad for the digital carriers. What is more, some people think that digitization may pose a risk for the safety of information, while others think that it is not necessary to digitize printed documents.

One of the direct effects of weak preservation awareness is to "pay attention to the application, while scorning the protection." For example, although some documentary departments actively apply to be included into the List, once selected, they do nothing more. They believe that once the documentary heritage is selected for the Memory of the World List or the Memory of China Archive Documentary Heritage List, everything is all right, and do not think further preservation is required, such as preservation of the originals or the preservation of digital reproducibility. Moreover, some departments also expose some problems with respect to special funds for digital preservation of documentary heritage. For instance, inappropriate funding, where the funds cannot be earmarked, resulting in the documents needing digital preservation not being digitized. This influences both digital utilization and sharing, and wastes the best time to undertake digital preservation. Just as the famous culture scholar Jicai Feng said, "Applying for a 'World Heritage' is a sacred thing, but now, being in the 'World Heritage' application wave, most government's motives are questionable." Therefore, "regardless of material or non-material

cultural heritages, preservation is more important than the development. If there is no science-based conservation and rational planning, this heritage will ultimately be unworthy of the name.”⁸

3.5 Backward of the large-scale database construction

Although there have been some achievements in the construction of a digital library, digital archives and digital bibliographies of documentary heritage, these are far from the requirements for a special database of documentary heritage that would encompass the whole of the resources shared. Take the documentary digitization of the Republic of China as an example. The National Library undertook the Preservation Project for the Documentary Heritage of the Republic of China, which is a national documentary preservation project for the Preservation Planning of the Ancient Books in China, aimed at screening the documents to remove duplication, while repairing and digitizing them. This helps to avoid the duplication of documents in each place, and also protects the documents of the Republic of China. However, this project does not include the construction of a special database. At present, the database of the Republic of China either is embedded in the digital library project—such as the China-America Digital Academic Library, which is a part of the digital library project invested by the government—or the database is self-established by the institution where the documents are kept—such as the database of the Republic of China developed by the Shanghai Library, the special collection database of the Republic of China developed by Nanjing Normal University Library, and so on.

However, a comprehensive analysis of the present construction of the domestic database reveals that there are many problems, which are described as follows. Regarding content, the database is confined to the library collection, so it is hard to access the total digitized documentary heritage. Regarding the database function, some self-built databases just transform the documents into digital or microfilm format, such as the database of the Republic of China. These databases are not the real database for the documentary heritage. Furthermore, these databases fall short of a uniform standard, which is further compounded by complex problems related to the design structure, the description standard, the retrieval platform, and the browser.⁹ Therefore, it is impossible to make the digitized resources available without preconditions.

3.6 Less capital and backward technology

In China, documentary heritage preservation mainly relies on special funding provided by the central government. Nevertheless, the shortage of funds seriously affects the protection process of numerous documents. For example, although the central budget for the archive documentary heritage preservation fund has increased year by year, because of the huge number of documentary heritage items in the archives in China, combined with too many earlier outstanding accounts, the limited funds are only enough to invest in the salvage of important projects, so the increased funding is like a ‘drop in the bucket.’ Given the lack of supervision, the uneven development of regional economics, the insufficient funding of the archives sector, and the phenomena of misappropriating funds and not dedicating special funds, current conditions for the continued preservation of documentary heritage are extremely unfavourable.

⁸ Jicai Feng, “Concerns for More Protection While Applying the World Heritage,” [authors’ translation of original Chinese source] <http://beijingww.qianlong.com/1470/2010/08/20/229@127376.htm>.

⁹ Qin Sun, “Analysis on the Digital Construction of the Republic of China Records,” *Shandong Library Quarterly* 1 (2008):71-73. [authors’ translation of original Chinese source]

On the technical support level, the level of digital documentary heritage is low, particularly in the selected projects that take fonds as a unit. Due to age and improper conservation, the physical carriers of these documents become fragile. Some archives will break into pieces once touched. Digitization in these instances is very difficult, particularly since the digitization technology mainly depends on scanning, and it is very hard to accurately grasp the repair principle “as the original features.” In addition, the documentary heritage repairs that are undertaken suffer from a lack of matching standards of selection, procedures, methods, and inspection.

4. Prospects on China documentary heritage preservation

In October 2011, the 17th Plenary Meeting of the Communist Party of China put forward the resolution to build a socialist culture authority, so the development of socialist culture will be speeded up. The documentary heritage protection undertakings are bound to usher in greater development in the future to take advantage of this opportunity. Documentary heritage preservation is a huge social engineering undertaking, which not only requires the joint efforts of national, regional and documentary heritage preservation agencies, but also needs the participation, concern and action of every citizen. Given the current status of our documentary heritage protection and the existing problems, there is an urgent need to develop a reasonable and scientific documentary heritage protection system to promote our documentary heritage preservation in an orderly and sustainable manner. Specifically, we should effectively do as follows.

4.1 Improve the legal norms and evaluation system

In the construction of a legal system, we should take relevant international and domestic laws and regulations as reference points to formulate a special law—China Documentary Heritage Preservation Act—or else increase the relevant legal items of the documentary heritage preservation into the existing Cultural Relics Protection Law of the People’s Republic of China, so as to effectively address the problems of documentary heritage preservation and ensure that all of the work undertaken has the necessary legal support. With respect to the development of standards, we should learn from the international Guidelines promulgated by UNESCO and from the selected rules of the United Kingdom, Australia and other countries, and formulate the Selected Rules to China’s Documentary Heritage Programme and China’s Documentary Heritage Preservation Standards. This also should involve refining the assessment of the relevant standard indicators, such as simplifying the second level of evaluation indicators on the basis of the importance of the first level assessment indicators and enhancing the operability of the evaluation indicators, while increasing the percentage of non-archival documentary items, including community documentary items of spiritual value. This will help ensure the preservation of a broader scope and field of distinct documentary heritage in China by helping avoid the underreporting of items, and paying equal attention to both local fields and international fields, thus improving the overall degree of standardization of China’s documentary heritage preservation.

4.2 Deepen theoretical research and strengthen resource integration

Theoretical research is the summary and promotion of the digital preservation of the documentary heritage. In the future, the theoretical research should pay more attention to the development and

promotion of feasible measures of digital preservation and offer practical suggestions for carrying out such work.

Firstly, we should conduct multi-interdisciplinary research into the damage mechanisms, protection environments and preservation methods of the digital heritage carriers, absorbing the newest achievements of modern materials science, to establish the basic theories, concepts and procedures of great general significance for providing the best practical guidance for documentary heritage digitization.

Secondly, we should study and formulate a list of documentary preservation that is inclusive and cohesive. If the list is established, it could rectify the awkwardness of the current “archives only” nature of the list. As well, it could help avoid the problems of ‘list fighting,’ resources distribution, and the division of policies from various sources. It is suggested that we integrate the Memory of China Archive Documentary List and the National Precious Ancient Books List, and establish the Memory of China Documentary Heritage List, while concentrating the necessary manpower, material and financial resources to strengthen the joint application of documentary heritage preservation in order to avoid preservation rivalries among the various documentary heritage sectors.

Finally, we should integrate research resources. On the one hand, researchers of the digital preservation of the documentary heritage should work together to ensure effective communication, dialogue and cooperation, thus creating a ‘big stage’ for the digital preservation of our documentary heritage. On the other hand, the archives, libraries, and museums should keep developing features and advantages among themselves, as this is helpful to ensure a diverse culture.

4.3 Strengthen public awareness and personnel training cultivation

In the future, our country should take advantage of the advanced international experience to preserve the documentary heritage as well as enhance public awareness. In particular, we should actively and publicly promote the importance of documentary heritage preservation in all sectors of society. This could include, for example, carrying out interactive preservation activities during “World Cultural Heritage Day” to improve social awareness of the issues and to promote a collective consciousness about documentary heritage preservation that will, in turn, engender a good preservation environment. Preservation of documentary heritage cannot be separated from the personnel training, so shortage of professional preservation and management personnel is a bottleneck restricting the development of documentary heritage preservation. To solve this problem, on the one hand, we should strengthen the introduction and exchange of international talent; on the other hand, we should encourage the self-cultivation of professionals, gradually form the talent echelon for archives preservation and research, and enhance further the national self-consciousness of cultural inheritance.

4.4 Broaden the financing path and manage funds strictly

The current financial allocation to documentary heritage preservation is the most important and stable funding source, but it often is too little to fully carry out the work, so we should broaden our funding base for documentary heritage preservation. For example, we could actively encourage private capital by outsourcing documentary heritage preservation to businesses, and so on. In this area, we can learn from

the successful documentary heritage preservation experiences of the USA's "the founding era",¹⁰ to engage actively in private fund-raising activities while trying to secure more national funding. In particular, we should strictly implement a policy of "a fixed sum is for a fixed purpose" for the allocated documentary heritage preservation funds, and increase both social supervision and the punishments for the misappropriation of funds. We should implement a project schedule for the process of special documentary heritage preservation, implement a mid-term project inspection measured against acceptable project development, comply with the documentary preservation and repair principles, and put in place strict quality controls. Furthermore, we should ensure that we do not delay the timing of these actions so that we do not miss the best preservation opportunities.

4.5 Innovate the technology of preservation and accelerate the construction of the database

Because advances in digital technology happen quickly, and because the preservation objects are complicated, documentary heritage digital preservation is a dynamic process. Consequently, digital scanning technology based on optical character recognition (OCR) technology alone cannot satisfy the preservation requirements. Instead, we must continually explore new digital technology to meet the different needs, and strive for the most cost-effective approaches that balance speed and quality during the digital preservation of documentary heritage.

At present, the level of digitization of the precious documentary heritage is not high in China, and the database is still at the initial stage. In the future, we should pay more attention to the database of the local, minority and the special documentary heritages. In particular, we should speed up the pace of digitization of the original documentary heritage items that are not included in the Memory of China Documentary Heritage List, construct a platform of preservation and management, study and establish the huge database mode for the documentary heritage preservation, establish a comprehensive database management system, and improve the capacity of the system against risks. In addition, we should emphasize the construction of standard and special collections, while importing advanced databases and building the special databases ourselves. Only in this way will we be able to construct a digital preservation system for our documentary heritage.

4.6 Promote the digitalization and cover all kinds of documentaries

China's documentary heritage is wide ranging, and the standards of classification vary widely. Depending on the locations of individual documentary heritage items, they could be preserved in public institutions (archives, libraries, museums, etc.), or be kept with folk organizations or in the custody of individuals. The different types of documentary heritage items include minority documentaries, Republic of China documentaries, the Cultural Revolution documentaries, celebrity documentaries, and so on. At present, the objects of digital preservation are the documentaries kept in the public literature institutions—i.e., the local documentaries, the minority documentaries, and the Republic of China documentaries. However, the Cultural Revolution documentaries, celebrity documentaries, and scientific and technical documentaries, which are rich in social, cultural, historical and economic values are not included in the digital preservation planning. In the future, we should gradually expand and extend the scope and depth of the

¹⁰ Jianghua Wu, "Documentary Heritage Preservation Process in the USA 'the founding era'," *Archives Science Bulletin* 4 (2011): 30-33. [authors' translation of original Chinese source]

digital preservation documentary heritage to include these other areas so that our entire documentary heritage is covered.

5. Conclusion

At present, the documentary heritage preservation programme has begun to take shape and has achieved some results in China. However, there are a lot of problems at the same time. The future road of documentary heritage preservation is long and tortuous. Only if we are able to take full advantage of the rich documentary heritage resources in China and effectively solve the relevant problems will be able to make our valuable documentary heritage available to the Memory of the World List and allow the rest of the world to share more fully in China's cultural achievements.

Open Archival Information System Reference Model: Answer or Inspiration?

Digital Archiving Systems Confronted with the OAIS Reference Model

Stefano S. Cavaglieri

Abstract

The OAIS reference model defines Archival Storage as the entity that contains the services and functions used for the storage and retrieval of Archival Information Packages. Can we use this term to define a digital archiving system? A clear definition of Information is central to the ability of an archiving system to preserve it. A system can be said to have a knowledge base, which allows it to understand received information, where information is defined as any type of knowledge that can be exchanged, and this information is always represented by some type of data. In the digital domain, in order for bits and bytes to be successfully preserved, it is critical for an archive to clearly identify and understand the data and its associated representation. This requires transparency to the bit level, and is a distinguishing feature of digital information preservation, which runs counter to trendy object-oriented concepts. This presents a significant challenge to the preservation of digital information.

Author

Stefano Sergio Cavaglieri is Chief Technology and Information Officer for the Swiss National Sound Archives in Lugano, Switzerland. His career started back in the late 70s in the audio engineering field. In the late 80s, in parallel to audio, Stefano broadens his interests with computer science. His expertise and analytical skills lead him to be now one of the most recognized technical authorities in the multimedia archives community. Stefano holds a degree both in electroacoustics and in computer science. He serves as an active member of IASA – TC, ALA, and AES.

The Open Archival Information System (OAIS) reference model, a standard (ISO 14721:2012) now widely adopted all over the world by all kind of archival organizations, defines Archival Storage as “the entity that contains the services and functions used for the storage and retrieval of Archival Information Packages (AIP).”

The terms “archival storage” and “digital archiving system” are often confused with each other and mistaken, probably because both contain the word “archive”. But archival storage is only one of the various components that constitute the OAIS functional model, and only one piece of a proper digital archiving system, which should be understood as a bunch of physical, as well as logical parts, all aimed to the preservation of digital information. The basic set of functional entities of such a system is made up of Ingest, Archival Storage, and Data Management. While the full set expands it by adding Administration, Preservation Planning, and Access. There is no one-to-one correspondence between each single functional entity of the OAIS reference model and any physical or logical component, the only exception being perhaps any non-digital parts, such as a printed manual for instance.

A clear definition of Information is central to the ability of an archiving system to preserve it. A system can be said to have a knowledge base, which allows it to understand received information. Information is defined as any type of knowledge that can be exchanged, and this information is always represented by some type of data.

As an example, the information in a printed book is typically expressed by the observable characters which, when they are combined with a knowledge of the language used, are converted to more meaningful information. If the recipient does not already include this language in its knowledge base,

then the written text needs to be accompanied by relevant dictionary and grammar information, in a form that is understandable using the recipient's knowledge base.

The same should apply in the digital domain. In order for bits and bytes to be successfully preserved, it is of essential importance for an archival organization to clearly identify and understand the data and its associated representation. This requires true transparency to the bit level, and is a distinguishing feature of digital information preservation, even though it runs counter to the object-oriented concept and trend, which indeed tries to blur everything behind a user interface. This presents a significant challenge to the preservation of digital information.

The software layer that is typically used to access digital information, does incorporate some understanding of the network of representation information objects involved. However, the fact that we have this piece of software at our fingertips should not be used as rationale for avoiding identifying and gathering readily understandable representation information that defines the information object. Please keep in mind that it is harder to preserve working software than to preserve information in digital or hard-copy forms.

Having said that, when designing and implementing a digital storage system conforming to the OAIS reference model, we are requested to think and act with absolute coherence from the top to the bottom. We must ensure that the information to be preserved is independently understandable to the community. In other words, a series of bits, usually packaged into a file, should be accessible transparently, without needing any third party assistance, all the way long, down to the physical storage media, being it a disk, a tape, a chip, or whatever built into the digital archiving system.

A key to success, on this matter, for organizations such as libraries and archives, is to consider a digital archiving system in a very much similar way as a traditional, physical archive, and to pretend it to function likewise. But how? Let's start by tracking a typical journey of a physical sound carrier, from the very moment it enters the archival premises, down to its final storage in the vaults, keeping constant, side-to-side comparison with its digital derivative:

- A sound recording is delivered by means of a physical carrier (i.e., a CD, a vinyl disc, a tape, etc.) to the archival organization. There, it gets visually inspected for damages and, if no visible issues are detected, its acquisition, or entry, gets recorded. Otherwise, it is sent back to the distributor, asking for a replacement copy. If this is the case, the process restarts from the beginning. In OAIS terms, this corresponds to the interaction between Producer and Archives, by means of a Submission Information Package (SIP), under Administration control.
- Next step is to proceed to inventorying, where our sound carrier is assigned a call number, which identifies the specific Item we hold in our hands. This is the beginning of the Ingest process, where we start generating an AIP.

Already at this very early stage, if the item (i.e., the sound carrier) is solely identified by a code only readable by a machine, such as a numeric barcode for instance, its accessibility starts relying on the availability of the logistics management system, which says number "n" belongs to room/rack/shelf "xyz". Take off, for any reasons, this set of hardware machinery and related software, and you're done! In case your organization spans a number of vaults, storing millions of items, your specific sound carrier might be buried forever, and its preservation compromised as a consequence.

You can prevent this from happening, and make life easier for your archive staff, by defining and strictly enforcing a clear naming convention. Our recommendation: the call number assigned to an item should be some sort of a human-readable, and understandable, unique identification, possibly relating to

the item's physical location within the storage facility. It shall contain enough information for an archivist to understand what room, what rack, what shelf to look for, first to archive it and later to find it again whenever needed.

In OAIS terms, the naming convention defined for-/ and applied to a call number, together with some basic understanding of the logistics of the vaults, constitute the knowledge base, which allows the archivist to understand the received information.

- Cataloging comes next, where unstructured data is read from the sound carrier itself and its container, which may be an envelope, a box, or any annex. All data is then structured (i.e., split and normalized) according to some standard set of cataloging rules. Assuming we adopted the Resource Description and Access (RDA) standard (as an OAIS note—Did we already include this information in the overall knowledge base of our organization?), which embeds the Functional Requirements for Bibliographic Data (FRBR) model, all document-wide data is grouped and entered as a Manifestation entity, while each track-related set of data is entered as an Expression entity, and refers respectively to a Work entity.

If we, as many of us already do, use a database system for keeping track of the information, each of the above entities usually gets its own identification (ID). Most of the times this IDs are automatically generated and assigned, maybe hidden, by the system, then cross-linked in a way or another. Is the linking mechanism transparent enough? You may ask your vendor whether it is possible or not to determine the relationship between the various documentation entities (i.e., talking databases, between the various records and files, or rows and tables, depending on the underlying architecture) in case we'd take off this particular piece of software. When not, your collection is in danger, although a possible, but not always viable workaround would be to enter some additional linking information "that makes sense" into each and every record. Here again, in OAIS terms, we are in a situation where our best preservation intents might get locked in, in this case by some technology.

The descriptive information (i.e., the various cataloging entities) is an additional sensitive point by itself. Does it only exist as entries in a database? Is the filing system of the database proprietary? Is the data encrypted somehow? Did anybody decide for any particular character sets? Those are some of the questions an archival organization aimed to be OAIS compliant, should ask itself. As yet another recommendation: if one or more answers to the above questions are positive, we better think of protecting ourselves by storing this descriptive information in parallel (i.e., a periodic export from the database system would do the job), at the operating system level, as text-only, such as XML-based files for instance.

At the cataloging stage, the sound recording we received at the very beginning of this journey by means of a sound carrier, gets to life within the digital archiving system (i.e., the electronic catalog itself is a system component)—now its avatar exists and can be further exploited.

- Next, the sound carrier is taken to the re-recording facility, where it gets "digitized". In case of an analogue sound recording, its content is extracted using a suitable player and converted from analogue to digital (i.e., we generate a sequence of numbers, representing the amplitude of the original signal at specific points in time). In case of a digital sound recording, its content is simply transferred (i.e., the numbers are simply extracted as-they-are). This series of numbers (i.e., the digital information, also known as "essence") is then packed and stored as one or multiple entities into a particular filing system, which may consist of records, when talking Document Management Systems (DMS), or files, when talking straight file-/ operating systems (FS).

It would make sense to keep some sort of a relationship between the entities just generated and the original sound carrier. What about reusing, extending when necessary, the same naming convention already in place for assigning the call number? As of today, this is generally possible in a FS environment. It is true that file systems enforce some limits concerning the use of several specific signs, they may also make a difference between upper-/ and lower case, but as long as we are concerned with numbers, plain Latin alphabet characters, and some basic punctuation, there is no particular restriction. Assuming we agree with the initial statement and question, why don't we take our notion of room, rack, and shelf one step further and also apply it to the file system architecture (i.e., the directory structure, for instance)?

As an example, let's take a Compact Disc (CD): according to our naming convention, we assign it a call number, such as "CD123"—where "CD" refers to the format, thus to the vault and rack type (assuming we have some dedicated, optimized space for CDs), and "123" is a sequential number that, together with some range labels on the racks, refers to a position on a specific shelf. Now take its digital derivative: the contents extracted are a series of files, sharing the same call number, identified such as "CD123_1.wav"—where "CD123" refers to a (sub)directory in our file system, "_1" refers to track #1 on the original CD, and ".wav" refers to the file format we are actually storing. If all data we derive or extract (sound, images, text, etc.) from the original CD is treated and stored the same way as for the above file, following the same principles and rules, and put into the same directory, this directory potentially becomes our AIP, thus fully OAIS compliant.

In a DMS environment, things tend to get more complicated, in a very similar fashion as earlier described for the linking of cataloging entities. We can re-raise the cross-linking issue by saying we need some sort of a human-understandable mapping between the IDs assigned to these "essence-records" by the system and the real world. In case of a negative or non-exhaustive answer from the system vendor, (we're still trying to conform with OAIS, right?) we are once again in danger of getting locked in by some technology.

- As a last step, our sound carrier is prepared for long-term archiving (i.e., it is cleaned and repackaged, if necessary), then taken into a secured, climate-controlled vault, and placed in the rack and on the shelf it belongs to, according to the information embedded in its call number. From now on, only its digital derivative is delivered to any patrons or customers, on demand, as a Dissemination Information Package (DIP).

We may think we are on the safe side now—we just put a number of potential issues on the table, and for some we even found a solution—there comes the next problem: the storage. Digital storage in not equal digital storage, under several perspectives. Let's start from the core, the storage medium:

- Is it a hard disk? Besides any sudden crashes, as a very common head crash for instance, the data stored on it looks quite safe... as long as you keep it spinning—otherwise strange behavior as bit-flip may occur; and attached to the same device—its input/output bus might become obsolete; and you drive it with the same operating and file systems—although there's a certain cross-compatibility between those, no guarantee you won't lose data when you switch it.
- Is it a disk array? The security level is somewhat higher, compared to a standalone disk, and very much depends on the so called RAID level we adopt. Assuming we have enough resources, and go for a most reliable level, as RAID-6 for instance, which can tolerate the concurrent failure of no less than two hard drives, are we aware that data, when written to, is automatically split across

several disks? And that just removing one of such disks from the array, trying to read it as a standalone unit, will turn into a miserable failure?

- Is it a cartridge, perhaps in a robotic library? The security level becomes even higher... provided that, among other things, the data written on the cartridge are directly accessible, thus unmodified by any software layer sitting in front of it; the drive needed for reading this specific format is also available as a standalone device and it can connect to your computer.

If you are lucky enough to own-/ or plan for one or more cartridge-based robotic libraries, we strongly recommend to ask your vendor (i.e., you better do the test personally) whether it is possible or not to do the following with your system: write a file to the system using its full functionality; take note of the ID of the cartridge your file is being written to; brutally switch-off the system, open the door of the robotic library and pull the affected cartridge; connect a suitable drive to your computer (please consider running some version of Unix or Linux) and insert the cartridge; mount it as a regular volume and eventually try to find and to read your file. Was your test successful? If so, you are one step closer to OAIS compliance. If not, you may, sooner or later, get into big troubles.

Although not exhaustive, this list of considerations somewhat scratches the surface of the subject as in the title of this paper. The main intention is to give a basic understanding of it, to highlight a number of difficulties and potential points of failure, some of it very basic, as well as to show the level of complexity everyone is facing when trying to design, to implement, and to eventually run a proper OAIS conforming digital archiving system.

One might even wonder, at this point, whether it is possible or not to get through and to solve all these issues. The good news is: this is possible, although rather expensive, in terms of resources required! The bad news is: it is fairly supported by most solution providers. Why are they not supporting it?

Anyone familiar with the words benefits and revenues? And the fear of seeing any glitches on the mid-/ to long run? This is probably also due to the difference in perspectives, when talking long run—for a typical Information Technology (IT) company “long run” is something between 5 to 10 years, while for an archival organization it means just forever.

Talking resources, money is unfortunately the foundation for keeping digital archiving systems alive. Need some arguments? Each and every digital archiving system relies on energy—mainly for keeping it running and cooling it down—and the amount of energy required can be huge, depending on the system architecture, the place it is located, etc. Handling and management of such systems need very specific skills—which translates in expensive training for resident staff and maintenance contracts—and dedicated staff, in case of medium to large scale systems. IT components in general become obsolete very quickly—hard disks have a typical lifespan of about 5 years, cartridges would last longer but new generations are introduced approximately every 3 years, not to mention any software related issues—thus major migrations must be regularly scheduled.

All this means you are required a constant flow of money, from the very first day you even think of your own digital archiving system until a new revolutionary, universal archiving technique is invented. This may sound frustrating but it sums up the current, real situation.

What to do if you are a smaller organization? Think of being in a privileged situation. In fact, an attractive, complementary option to what discussed so far is merging (i.e., harvesting) your collections and problems with a conforming OAIS archiving system of a larger organization. This has lots of benefits and almost no negative side effects.

In conclusion, the main advantage offered by a digital archiving system is that it is self-contained, which means everything is available from the same source, at your fingertips. In some cases, as in the audiovisual world for instance, it is even the sole means for preserving (at least part of) our cultural heritage. While the main disadvantage is that it is made up of a large number of unstable components, which are assumed to keep talking to each other. With the term “unstable” I mean that each and every component is constantly updated, in some cases enhanced or even replaced with new ones, which requires the perpetual allocation of enormous resources.

Besides all that, beyond technology, the most important thing we should never forget is that the knowledge base is your life-jacket—everything (procedures, standards, workflows, technical insights, etc.) should be documented, to the bone... preferably on plain paper.

A Model for Managing Digital Pictures of the National Archives of Iran

Based on the Open Archival Information System Reference Model

Saeed Rezaei Sharifabadi, Mansour Tajdaran and Zohreh Rasouli

Alzahra University, Iran

Abstract

The present research is to represent a model for managing digital pictures of National Archives of Iran, based on the Open Archival Information System reference model (OAIS). The research is quantitative and uses the library method. Descriptive and analytic survey is also used for data analysis. The data are gathered through a researcher made check list. The statistic population involves 32 persons, expert at digital preservation field and familiar with OAIS reference model, among whom only 20 persons accepted to complete the check list. Regarding experts' viewpoint, 89 elements from the total 135 elements available at audit list, have been represented for the suggested model of managing digital pictures of National Archives of Iran. Digital pictures are important records which have considerable role on the meeting of users' information needs. Since there has been done no research at the field of managing digital pictures of National Archives of Iran, based on OAIS reference model so far; this research is to represent a desirable model for managing digital pictures of National Archives of Iran through developing a check list based on OAIS reference model.

Authors

Saeed Rezaei Sharifabadi received his Ph.D. degree in Library and Information Science from the University of New South Wales (Australia) in 1996 and is currently an Associate Professor and the Dean of Faculty of Education and Psychology at Alzahra University (Iran). He has served as the Editor-in-Chief of *Ganjine_ye Asnad* (a historical research and archival studies quarterly) since 2006. Dr. Rezaei is also former Deputy National Archivist of Iran and a former member of the Iranian National Committee of the Memory of the World Program. He has been part of the InterPARES Project during his sabbatical leave at the University of British Columbia in 2009. His publications/research deal mainly with IT Applications in Libraries and Archives, srezaei@alzahra.ac.ir.

Mansour Tajdaran is an Assistant Professor in the Department of Library and Information Science at Alzahra University, tajdaranmansour@yahoo.com.

Zohreh Rasouli holds an M.A. in Library and Information Science from Alzahra University, rasoulizohreh@yahoo.com.

1. Introduction

Today, many information centers have digitize their resources. With the development of technology, various formats developed the old softwares and hardwares are replaced with the new ones. All these cause a big challenge for the long-term access to the content of digital resources. Therefore, applying the digital life cycle, which is responsible for the preservation and long-term access, is considerably important. Many national libraries and archives have benefited from OAIS reference model for designing and constructing their digital archives. Currently, this reference model is a well-known standard in the field of digital preservation that has been approved by ISO in 2003. The OAIS has created a general

model or framework for the construction and maintenance of information warehouse for the long-term preservation and access to digital materials (Samiee, et al. 2011, p. 165).

2. Research Questions

The present research is an attempt to answer the following research questions regarding the experts' viewpoints:

1. What are the most important components of the OAIS reference model ingest functional entity for managing digital pictures of the National Archives of Iran?
2. What are the most important components of the OAIS reference model archival storage functional entity for managing digital pictures of the National Archives of Iran?
3. What are the most important elements of the OAIS reference model data management functional entity for managing digital pictures of the National Archives of Iran?
4. What are the most important components of the OAIS reference model administration functional entity for managing digital pictures of the National Archives of Iran?
5. What are the most important components of the OAIS reference model preservation planning for managing digital pictures of the National Archives of Iran?
6. What are the most important components of the OAIS reference model access for managing digital pictures of the National Archives of Iran?

3. Review of the Related Literature

The review of the related literature which includes the previous studies conducted inside and outside Iran are further discussed in details.

Samiee (2010), in her Ph.D. dissertation titled "an Examination of the digital preservation posture of the resources of national libraries members of the Internet Preservation International Consortium and representing a suggested model for the National Library and Archives of Iran," studied and analysed the OAIS reference model as the only digital preservation standard in digital repositories and suggested the implementation of this standard at digital libraries' software.

Beedham et al. (2004) in a research paper titled "Assessment of Ukda and Tena conformity rate to METS (Metadata Encoding and Transmission Standard) and OAIS reference model," examined six main entities of the OAIS reference model and METS and then explained about their functions at digital archives such as Tena and Ukda.

Sample (2004) in a research paper titled "Developing strategies for Digital preservation in Edinburg Academic Library," studied the general view toward developing preliminary project of digital preservation in Edinburg University; the integrity of METS; the OAIS reference model and development of digital preservation operations at digital materials system in Edinburg Academic Library.

Anderson et al. (2006) in a research paper titled "An archival study of digital photos," described digital photos features, preservation strategies, metadata available for digital photos and digital photos life cycle at the OAIS reference model and trusted digital repositories (T.D.R.).

Nordland (2007) in his Ph.D. dissertation titled as “International Development and Research Center (IDRC), a case study for long-term preservation strategy, has considered challenges for archivists and records managers at long-term preservation management of digital records. This dissertation has studied IDRC as a prominent instance in different areas of digital long-term preservation such as digital preservation standards and strategies, permanent digital repository, web archiving and alike. The results of this research have contributed to the OAIS reference model for maintenance and preservation of information resources at archives.

The reviewed studies indicate that the OAIS reference model is a formal standard at digital preservation area and using it at digital repositories will contribute to the integral management of existing digital resources, saving cost and time for setting up digitizing systems and easy sharing of and access to information. This research aims at suggesting a framework and model for managing digital pictures of the National Archives of Iran, based on this model (OAIS).

4. Research Methodology

Regarding the content of this research, it is a survey study (descriptive and analytic). First, OAIS reference model was studied in order to determine the prominent activities at main functional entities of reference model, including: ingest, archival storage, data management, administration, preservation planning and access. Final entity is common services which underlies all the others, and includes operating system services, network services and security services.

After determining these activities for data gathering, a list of 135 closed questions—based on Likert scale (5 options)—was designed which included the 6 main entities: ingest (23 questions), archival storage (21 questions), data management (21 questions), administration (28 questions), preservation Planning (25 questions) and access (16 questions). Content validity method has been used to assess the researcher made assessment list validity. After preparing the checklist, experts in the archival field and members of scientific board were asked to assess its validity, and then the suggested revisions were made, Cronbach alpha coefficient was used for assessment of the checklist reliability at this research; the checklist reliability has been calculated through Cronbach alpha coefficient, separated into 6 main entities of the OAIS model (Table 1).

Table 1: Cronbach Alfa quantities, separated into 6 main entities of OAIS model

number	OAIS reference model entities	Cronbach Alfa
1	Ingest	.754
2	Archival storage	.744
3	Data management	.853
4	Administration	.865
5	Preservation planning	.848
6	Access	.718

As we can see in the above table, Cronbach Alpha for each main functional entity of the model is higher than 0.7. This shows that the checklist stability is favorable.

5. Data analysis

After gathering the existing data at the researcher made checklist, these data were analysed through descriptive statistics (including cumulative frequency percent, average, and standard deviation) and SPSS software. The results are represented at the following tables.

5.1 The most important elements at OAIS reference model Ingest entity

Before Ingest of the data, a data transmission contract (negotiation with works authors about dedication agreements) will be concluded and then the activities of this entity are accomplished, including: obtaining Submission information package (SIP), quality guarantee of SIPs, production of archival information package, extraction of descriptive information from archival information package and coordinate updating.

Among 23 prominent elements at the ingest entity of OAIS reference model, 14 elements with the averages of 5, 4.5 and 4 and with the cumulative frequency percent higher than 80, were identified as the most important prominent elements at the ingest entity, which are presented in Table 2.

Table 2. The prominent elements at OAIS reference model Ingest entity

1. Ingest functional entity		
A transmission contract with dedicator (work author)	Data delivering way (at archives location, through computer network, ...)	
	Determining necessary information at SIP	
	Determining the rate of originality (original or copy)	
Ingest of SIP	Way of SIP delivering	File transfer protocol (FTP)
Quality guarantee of SIP	Controlling of SIP to have no virus before transmission	
	Scanning to control errors	
	Controlling of SIP not to have virus	
Production of archival information package (AIP)		
Extraction of descriptive information from AIP	Cataloging records	
	Index files	
Coordination of updating at archival repository	Making descriptive information integrative	
Data management	transmission of AIP to archival storage	
	transmission of descriptive information to data management	

5.2 The most important elements at OAIS reference model archival storage entity

This entity includes activities such as: the Ingest of archival information package from ingest functional entity and adding it to the permanent memory; hierarchical management of repository; replaced media; determining the rate of the importance of methods for controlling regular and special errors; retrieval improvement; and data acquisition.

Among 21 prominent elements at OAIS reference model archival storage entity, 11 elements with the averages of 5, 4.5 and 4 and with the cumulative frequency percent higher than 80, were identified as the most important prominent elements at archival storage entity, which are presented in Table 3.

Table 3. The most important elements at OAIS reference model archival storage entity

2. Storage functional entity			
	acquiring of AIP from Ingest functional entity and adding it to permanent memory	Determining media type for AIP storage	
	Hierarchical management of repository	Storage methods	Online
		hierarchical	offline
	replace media	Selection of replace media type	
		Transmission methods	Refreshment (like transmission from old DVD onto new DVD)
			Replication (like transmission from DVD onto CD)
	Repackaging (like transmission from GIF format into JPEG)		
	Determining the importance rate of methods for controlling regular and special errors	Allocation of identifiers (ID)	
		Checksum of each data file	
	Retrieval improvement (backing up)	Copying digital content	
	acquisition for information representing	Acquisition a copy from AIP for access entity (for order completion)	

5.3 The most important elements at OAIS reference model data management entity

This entity includes activities such as: management of archival information base, question representation (query), acquisition of report from answers and updating of database (placing of new descriptive information or archival management data).

Among 21 prominent elements at OAIS reference model data management entity, 16 elements with the averages of 5, 4.5 and 4 and with the cumulative frequency percent higher than 80, were identified as the most important prominent elements at data management entity, which are presented in Table 4.

5.4 The most important elements at OAIS reference model Administration Entity

This entity provides services and operations for archival systems and manages the general operations of archival systems. Management tasks include: arrangement of data transmission contract (negotiation with producers about representation agreement), management of hardware and software systems configuration, physical access control, creation of archival standards and policies, activation of cumulative requests, services for users.

Among 28 prominent elements at OAIS reference model data management entity, 23 elements with the averages of 5 and 4; and with the cumulative frequency percent higher than 80, were identified as the most important prominent elements at administration entity, which are presented in Table 5.

5.5 The most important elements at OAIS reference model preservation planning entity

This entity supplies services and operations for monitoring Open Archival Information System (OAIS) and also is responsible for theory provision to guarantee the long-term access to the stored information at

Table 4. The most important elements at OAIS reference model data management entity

3. Data management functional entity		
Archival database management	Creation of descriptive metadata (like Dublin Core and VRA Core)	
	Creation of constructive metadata	
	Creation of preservation metadata (like PREMIS)	
	Creation of legal metadata (like ODRL)	
	Creation of technical metadata (like MIX)	
	Metadata Encoding and Transmission Standard (METS)	
	Studying of information originality and controlling of information integrity	
	Exerting of users' ideas about repository content	
Query implementation	Production of responses set	
	Acquisition of descriptive information	
Acquisition of report set from among responses set	Applying of statistic indicator for access to archival holding	
Updating of database	Updating of descriptive information for new AIP	
	The necessity of system's information updating	Applied statistics
	Checking updating	Checking important information (names and signs)

Table 5. The most important prominent elements at OAIS reference model Administration Entity

4. Administration functional entity	
Arrangement of data transmission contract	Determining of data transmission format at transmission contract
Management of hardware and software systems configuration	The necessity of following up system operations for warranting archival operations
	The necessity of following up system implementation for warranting archival operations
	The necessity of following up system application for warranting archival operations
Updating of archival information	Creation of a mechanism for updating archival content
	Updating through sending dissemination request to access entity
	Updating of the resulted DIP and redelivering it to ingest entity as SIP
	acquiring changes request, procedures and configuration management tools
Exerting physical access control	
Creation of standards and policies	The necessity of determining physical access control policy
Archives	The necessity of determining copy right policy
	The necessity of determining budgeting policy
	The necessity of determining policy for retrieval improvement

	The necessity of determining resource usefulness
	The necessity of determining standards for dissemination formats (according to users' priority, e.g., TIF, GIF, JPEG)
	The necessity of determining pricing policy
	The necessity of determining new archival data formats
	The necessity of determining transmission goals
	The necessity of determining transmission formats
Activation of accumulative requests	The necessity of periodical review of conformity rate of user's request with archives content (in order to assess information availability)
Services to users	Responding to the requested information
	Responding to the users' feedbacks against access services and products

OAIS, even if the environment and the main calculation system is useless. The tasks of preservation planning include: monitoring community of the goal, surveillance technology, developing standards and preservation strategies, developing packaging plans and transmission programs.

Among 25 prominent elements at OAIS reference model data management entity, 14 elements with the averages of 5, 5, 4 and 4; and with the cumulative frequency percent higher than 80, were identified as the most important prominent elements at preservation planning entity, which are presented in Table 6.

5.6 The most important elements at OAIS reference model access entity

The tasks of this entity include: coordination of access activities(methods of user interaction with archives, request type, making resources available, and users validation for access to resources), production of dissemination information package (DIP), and delivering answer to user.

Among 17 prominent elements at OAIS reference model data management entity, 11 elements with the averages of 5, 5, 4 and 4; and with the cumulative frequency percent higher than 80, were identified as the most important prominent elements at access entity, which are presented in Table 7.

6. Conclusion

About 80000 pictures have been so far digitized at the National Archives of Iran. The National Archives of Iran needs strategies for digital preservation in order to supply future generations with access to this digital heritage. "Since reference model is responsible for long-term access to digital resources and has been used for long-term preservation of digital resources by many national libraries and archives, a checklist was designed based on 6 main entities of this model at the present research—including 135 closed questions based on Likert scale (5 optional)—and were given to experts in order to determine the importance rate of each of elements and finally 98 important elements were identified among which 14 elements are related to ingest entity (Table 2), 11 elements to storage entity (Table 3), 16 elements to data management entity (Table 4), 23 elements to administration entity (Table 5), 14 elements to preservation planning entity (Table 6), and 11 elements are related to access entity (Table 7).

Table 6. The most important elements at OAIS reference model preservation planning entity

5. Preservation planning	
monitoring technology	Determining of new digital technologies
	Determining of software detects for new storage and retrieval formats
	The necessity of exerting changes at conditions of services to users (regarding changes at users' information needs)
	Determining of hardware detects for new storage and retrieval formats
Developing of standards and preservation strategies	Migrate
	Transfer
	Emulate
	Technology preservation
	Creation of new standards for dealing with new transmission conditions
	Prediction of changes at conditions of services to users
Developing of packaging plans and migrate programs	Developing of new EEP patterns for responding to migrate goals
	obtaining standards from administration entity and acquisition of SIPs and EIPs
	obtaining new standards for dealing with new transmission conditions
	Applying pre-sample software for responding to migrate goals

Table 7. The most important elements at OAIS reference model access entity

6. Access functional entity		
Through computer network	Methods of user interaction with archives	Coordination of access activities
Interaction through web		
Determining of request type		
(queries, reports, orders)		
Making resources available		
Determining of request posture		
The necessity of user's name	Users validation for access to resources	
User's email address		
retrieving holding (through searching meetings, identifiers on AIP, representing of queries, and returning responses set)		
Determining of request type (set of descriptive information, dissemination information package (DIP), available information resources at archives, reports results)		
Production of DIP (dissemination information package)		
Way of delivering answer to user by archives		delivering answer to user

Collaboration in Digital Preservation or Lack Thereof: What Works

Digital Preservation in Europe

Strategic Plans, Research Outputs and Future Implementation. The Weak Role of the Archival Institutions

Maria Guercio

Abstract

The European investments for digital preservation in the last decade have been large and persistent but not able to support, at the moment, an accepted common vision, general services and adequate infrastructures. The author investigates this weakness by analysing the nature of the European funding programs in the field and the weak role played by memory institutions, specifically those with archival competences and knowledge, in the European research activities. A specific attention will be dedicated to the relevance for successful results of concepts such authenticity and the role played by a consistent terminology.

Author

Maria Guercio, a full professor in archival science and electronic records management at the University of Rome Sapienza (coordinator for research projects at Digilab Centre), cooperates with the State authority for ICT to define Italian legislation for ERMS and manages ERM training programs for the government school for public administration. She is a partner in many international projects for digital preservation (ERPANET, DELOS, CASPAR), was director of InterPARES' TEAM Italy (1999-2012), and is co-leading the investigation on digital authenticity for the European project APARSEN (2011-2014). She is part of the steering committee of the Section for Archival Education and the Programme Committee of the International Council on Archives. She is author of many articles and manuals in the field. In 2009, she received the Emmet Leahy Award for information and records management.

1. A Premise

The subject here discussed presents a high level of complexity due to the dynamic nature of the technological innovation, the increasing role of the organizational aspects and the interdisciplinary character of the research projects dedicated to digital preservation. To face these difficulties an accurate in-depth and contextualized approach is required. Even if this effort cannot be analysed in detail on this occasion, this conference and its setting offer an extraordinary opportunity for discussing the main promising but also controversial questions in this field. In Vancouver, thanks to UBC's continuing research work on digital preservation, an incredibly productive international environment has been developed in the last twenty years with stimulating results, such as a common terminology, robust conceptual frameworks and significant occasions for international and cross-domain comparisons and advanced educational programs. The UBC's projects—this is an important aspect of their success strictly related to their special original nature—had a very clear archival focus but had and have also the capability of involving other communities with an interdisciplinary approach. Moreover, the questions here proposed for debate have to face new scenarios and new organizational environments which are still undefined: large investments have already been spent or, at least, planned. The main innovative and challenging question is related to the fact that the global financial crisis not only implies new economic difficulties for the research environment but also makes evident the major responsibilities of universities and scientific center, recently defined as *entrepreneurs of innovation* able to “balance the need to articulate a broad strategic vision with the need to execute the day-to-day activities that translate the

vision into reality.”¹ Therefore, the topics here proposed for investigation cannot be ignored, not only for professional and technical reasons, but also and mainly with reference to the centrality in the global society of “research labs, classrooms, and innovations centers, where big ideas are hatched and subsequently translated into reality.”²

Similar to UBC research, many European research initiatives have been largely funded in the same field of digitization and digital preservation in the last decade, but with minor success. They have not been able to maintain a similar level of continuity and, in particular, a comparable level of such global influence. The role and the relevance of the European effort in this research area are undeniable, but they have not been able to re-create (with the partial exception of ERPANET)³ the InterPARES atmosphere of international cooperation and a similar original and authoritative contribution to the research in one scientific domain (in case of InterPARES, the preservation of authentic digital records) and to the enlargement of the interdisciplinary cooperation boundaries. Are these exceptional outcomes due only to the unquestionable quality the researchers involved in the project possess or is something not convincing in the direction and strategies followed in the European funding system in this specific sector? Other successful projects (which are not strictly related to the digital preservation, but connected to the digital heritage) can be mentioned because of their similar global influential capacity as InterPARES: Dublin Core Initiative, the OAIS model, Encoded Archival Description standard, digital curation paradigm, audit framework for trusted digital repositories are just some of the best known products, developed in one sector or thanks to the strict coordination of archival and librarian scholars and professionals and transformed into general and basic elements and tools for building enhanced infrastructures. None of them has been implemented thanks to European funds. Besides, many or all of them have been developed on a domain basis, with a strong commitment of one or two scientific and professional communities. If this did not happen by chance, is it possible to identify and replicate successful conditions as a framework for developing an efficient research environment or, at least, to avoid negative consequences if the requirements are not respected?

These questions are simple and demanding at the same time. Specifically, they concern the identification and the analysis of the main obstacles weakening the relevant investments of the European Commission in the area of digitization and digital preservation and the role played by a cross-domain strategy as factor influencing and partially determining the fragmentation of intermediate and final results of the financed projects. Some assumptions are of course required as a basis for a sustainable line of reasoning.

A first provisional assumption is that the level of success in this complex and dynamic research area was and is linked to the capacity of investigating the domain specific questions with an open approach, based on general principles, solid and consistent concepts and rigorous methods. This means that a common methodological ground is necessary and has to be accepted as fundamental by the research community. The existing scientific traditions, of course, have to be assessed and updated. Well designed and contextualized dictionaries have to be discussed and approved. For this specific reason, a long and cumbersome series of activities are necessary before an investigation program could be operative and fruitful.

¹ Holden Thorp and Buck Goldstein, *Engines of Innovation. The Entrepreneurial University in the Twenty-First Century* (Chapel Hill: The University of North Carolina Press, 2010), 8.

² Ibid., p. 2.

³ “ERPANET - Electronic Resource Preservation And Access Network,” www.erpanet.org (Accessed August 22, 2012).

A second, still provisional, assumption concerns the interdisciplinary nature of the research. Once more, a solid interdisciplinary approach requires highly qualified specialization. The integration of competences can be fruitfully supported only as a second step after the recognition and the comparison of the research values inside each scientific domain.

The theoretical implications behind these two points are very complex and cannot be here investigated in detail. In this specific context, the attention is *simply* dedicated to illustrate the negative consequences (in terms of lack of generally recognized results because these assumptions have been ignored) of the European ‘political’ strategy dedicated to support digitization of cultural heritage and its preservation by facing the technological innovation. This strategy was initially defined in the period 2005-2007 and only partially updated in 2011⁴ with the goal of financing mainly (if not solely) interdisciplinary projects explicitly focusing on digital convergence. But the nature and the content of this interdisciplinary approach and the meaning and consequences of the digital convergence have never been defined and the convergent inclusion has excluded many relevant scientific communities and domains. The archival sector, in particular, even if its digital heritage is one of the most challenged by present and future technological innovations, has been substantially ignored by the European investments. One of the reasons is related to the underestimation of the potential negative potential impact and consequences of this marginalization (not only for the domain itself) in terms of advanced solutions for the research and for services implementation.

As a matter of fact, the limited contributions made available to the research activities of the European archival community (as will be further illustrated) have prevented its institutions from participating efficiently in the investigation regarding the main innovative topics. Therefore, the great European documentary traditions, diversified but also consistent in their basic common principles and methods, could not have been recognized and exploited in Europe and internationally with at least two relevant limits for the global (not only European) research. Firstly, it has been impossible to develop at the European level a strategy toward a systematic and standardized approach for electronic recordkeeping and preservation systems.⁵ Secondly, this delay has prevented the archival and record management community from providing effectively (that is as a recognized and authoritative network) its contribution to the research in the specific field of digital preservation and to the definition of digitization standards and parameters. The low level of qualified convergence and satisfactory level of interoperability of digital library initiatives (including Europeana, the EU digital library) provides undeniable evidence for these limits.

Since its first steps, and especially after 2007, the European strategies for the digital heritage have marked the centrality of actions aimed at promoting the cultural contents convergence, by overcoming quite always the specificities in the research investments and favoring (and selecting) quite only projects able to guarantee the largest participation of cultural institutions of the widest and most variegated nature

⁴ The relevant European reports on these aspects are: “i 2010 Digital Libraries Initiative” (2005), Commission Recommendation on Digitisation and Online Accessibility of Cultural Material and Digital Preservation (2006 – updated October 27, 2011), “Member States’ Expert Group on Digitisation and Digital Preservation (2007), “Communication from the Commission: ‘Scientific Information in the Digital Age: Access, Dissemination and Preservation’ (2007), Recommendation on Digitisation and Digital Preservation (October 2011).

⁵ The case of European recommendations for electronic record management systems, known as MoReq (MoReq1, MoReq 2 and MoReq2010), is emblematic: the specifications have required 10 years to be approved and to develop certification process but the final version of MoReq2010 is still under development, services for certification are not in place: and the European organizations at the moment are not compliant with them. See M. Guercio, “MoReq1, MoReq2 e MoReq2010: raccomandazioni e prove tecniche di certificazione per la gestione informatica dei documenti,” *Archivi* 1 (2012): 7-32.

and provenance as possible: as mentioned, the focus of all the European recommendations for digitization and digital preservation was and is on convergence of domains for accessibility and for interoperability. The quantity but not the quality is crucial for this strategy. At a matter of fact, the explicit political goal in 2007 and, even more, in 2011 was and is to ensure a critical mass of contents for the European digital library, called Europeana by:

[...] setting up or reinforcing national aggregators bringing content from different domains into Europeana, and contributing to cross-border aggregators in specific domains or for specific topics, which may bring about economies of scale, ensuring the use of common digitisation standards defined by Europeana in collaboration with the cultural institutions in order to achieve interoperability of the digitised material at European level, as well as the systematic use of permanent identifiers.⁶

The challenges involved in these new services risk to underestimate the role of the cultural heritage scholarships and knowledge differentiation and specialization which were and are at the basis of the European quality. “Convergence against integration” can appear as an easy and rapid shortcut for dealing with the digital convergence processes, but not necessarily will provide efficient solutions. In our specific area, this general policy had the consequence, among other things, of pushing the research institutions (and of course also the institutions of memory) to present projects characterized by a high degree of heterogeneity of purposes, participants and research components and activities. Even if nobody in any domain explicitly contested and contrasted this perspective and this orientation, the final result has been the marginalization of all the sectors not really involved in digital access and dissemination of published and native open public materials (that is digital resources immediately available on the web), such in the case of e-health records, or in the private business environment and in general in the recordkeeping systems).

Of course, as a consequence, any possibility for scientific investigation in each domain has been sacrificed to ensure multiplicity and diversity of actors, of contents and vocabularies and, more recently, to increase the quantity of information available and not the quality of its representation in terms of contextualized relations (that is with reference to the digital objects intelligibility and the capacity to assess over time their integrity and authenticity, to trust both digital contents and their relations). Even more, the illusion that the complexities involved in the digital preservation research could find at the end exhaustive answers in the multidisciplinary comparison has influenced the whole research sector: the partnerships could not be developed on the basis of the specific qualifications of the institutions to involve. The domain diversity of the projects partnerships was and still is an obliged requirement for successful funding. It has to be said that the institutions of memory (mainly the archival organizations) have shown here their limited capacity for developing strategic alliances (relevant not only for funding and for exploiting finance channels but mainly to create strong and permanent institutional interconnections. In the specific archival sector, another negative factor has been the substitutive role of coordination assigned, on an unclear basis and with insufficient commitment, to organizations like DLM Forum Foundation.⁷ This association, born in 1994 as “an inter-disciplinary cooperative effort led by the

⁶ Commission recommendation of 27.10.2011 on the digitisation and online accessibility of cultural material and digital preservation, Accessed August 21, 2012, http://ec.europa.eu/information_society/activities/digital_libraries/doc/recommendation/recom28nov_all_versions/en.pdf.

⁷ The recommendations of the European Council of November 14, 2005 were limited to ask the initiative of the Commission on the following aspects: “further development of European interdisciplinary co-operation on

EU member states and the European Commission,” became in 2002 an independent body and, in 2010, a non-profit foundation in the area of “archive, records, document and information lifecycle management throughout Europe.” More and more the Foundation has seen the increasing interests and direct participation of software companies and has diminished its original potential nature of a neutral network based on institutional values. Even if recognized by the European Commission, the organization has never been strongly involved in the European research projects. The role assigned by the Commission to the European Archival Group which (will be analysed more deeply in the second part of this presentation) had a similar marginal nature for the opposite reason: it has been supported for coordinating archival actions among the European institutions but it has never been included in the core research projects dedicated to the technological innovation, specifically preservation and digitization. The only exception is the APENET and now APEX projects and the portal dedicated to make the archival data available on the web and cooperate for ensuring interoperability with Europeana.

It is surprising to observe that the international scenario shows less archival marginality than the European context, even if (or because?) the work is done on the voluntary basis and the resources are very limited in comparison with the large amount of European investments. It includes the work done under the umbrella of the International Council on Archives, or the international research projects such as InterPARES and the projects on trusted digital repositories, but also the working groups of ISO committees and subcommittees on archival and record management (TC 46 SC 11). The archival Europe supported at various levels (mainly with direct participation) all these efforts thanks to the commitment of single institutions, but these actions and their strategic objectives have been substantially ignored by the EU funding bodies, as the available information on the last decade funded projects clearly illustrates:

- With exclusive reference to the research on digital preservation for the period 2006-2011, fifteen projects have been financed under ICT programs (the most important in the field here investigated); they have been funded with 86 million Euros with the specific aims of creating technology solutions and innovative methods to keep *digital resources available and useable over time*,⁸
- In 2012 other 30 projects have been approved for the amount of other 30 million Euros;
- None of the funded projects had and has an archival leadership (academic or institutional);
- The institutions with a specific and recognizable archival competence involved in these projects are very few (5-6), while the European partners involved are hundreds: as far as I know, Institution for Archival Studies at the University of Urbino (Caspar⁹), the National Archives of the Netherlands, the National Archives of England, Wales and the United Kingdom, the Swiss

electronic documents and archives, updating and extension of the requirements for setting up electronic document and archive management systems, such as MoReq and a continuation of the DLM Forum conferences on electronic documents and archives”. Federal Archives (Planets),¹⁰ the National Archives of Sweden and the National Archives of Estonia (Protage).¹¹

In contrast with the recent evolution, the first European strategy for digital preservation was, at least apparently, differently oriented. The ERPANET project, a *network of excellence* active in the period 1999-2003, was run by only 4 partners. Three of them had archival competences (the National Archives of Netherlands, the National Archives of Suisse, and the Institution for Archival Studies at the University of Urbino). The principal coordinator, Seamus Ross, director of HATII at the University of Glasgow, was at that time a close observer of progress made by the documentary disciplines in the field. The same partners (only the National Archives of Suisse were not included) successfully collaborated in the DELOS¹² project within the same work package dedicated to the digital preservation and developed promising ideas which were further implemented by following projects such as PLANETS¹³ and DPE¹⁴ (among other results, a set of procedures to document self-auditing with reference to the requirements for digital repositories trustworthiness, the systematic analysis of file formats for preservation, the creation of test-bed environments).

In the recent projects the archival dimension of the research progressively became marginal and sporadic. Other domains have been able to develop their influence and assume a strategic role in cooperation initiatives such as the library sector with reference to the European digital library Europeana¹⁵ or the network of government cultural institutions which still play a coordinating role thanks to a continuing series of EU funded projects (Minerva and Minerva eC,¹⁶ Michael¹⁷ and, more recently, Athena¹⁸ and Linked Heritage¹⁹). Also the audiovisual institutions were strongly supported in Europe with dedicated programs able to create a healthy chain of continuity (Presto, Prestospace²⁰ and Prestoprime).²¹

How effective is the cooperation in these cases is a question assessed only when the single project is evaluated by the Commission in the course of the funding process. At the moment there are no mechanisms in place (but only political initiatives) to develop on more general basis assessments of research areas and/or financing lines, or to evaluate and solve critical questions like the lack of interactions and cooperation or integration among sectors, even if explicitly recognized by official documents.

It is the case of the official critical remarks (published in the final report of the project) about the low level of inter-sector cooperation verified and recorded by the archivists involved in the APANET project when a *convergence* process was activated to create compliance and interoperability between the descriptive systems and standards of archival sector and those already developed by Europeana:

This is the final report of the APEnet WP3 team in which it describes the interoperability efforts it undertook throughout the whole APEnet project period as well as the difficulties it came across and the ways it found to deal with them [...]. The overall conclusion of this report is that the APEnet WP3 team has succeeded in making the technical interoperability fully operational, so in fact has done the job it was supposed to do, but could have accomplished more in case the Europeana team would have been more cooperative. The reason for this is that – despite a lot of efforts from the APEnet WP3 team – the interoperability on a strategic level has been a one way communication most of the time during the entire APEnet project period, plus the fact that on a technical level Europeana was much like a moving target and at the end of the APEnet project even out of reach for the APEnet WP3 team.²²

The fact is that the European archival institutions, whose historical custodial function could have supported, with the knowledge and experience accumulated for centuries, the understanding and the translation in the technological environment of crucial concepts such as digital trust, reliability, accuracy and authenticity and identify implementation methods and tools in the field of digital preservation, have never acted as main characters or leading protagonists. They obtained merely *protection* but not recognition as crucial players for central challenges. They have not yet created an effective European network able to support research and initiatives related to digitization processes and digital preservation. The DLM Forum Foundation²³—as has been already observed—lacks the institutional status for playing this role. The only initiative, lightly supported by the European Commission and previously mentioned, is the *European Archives Group*²⁴ but its attention is mainly dedicated to the traditional and still complex challenges of the analogue archives.

In the specific area of European research for digital preservation, a general and relevant critical question concerns the brief funding period always granted to the projects, no matter how promising the initiatives are: according to this policy, each research project should be able to survive and become sustainable in only 3-4 years of financial support and should be able to develop its own research center for strategic future programs. In other scientific sectors (as in the so-called *basic research*) European support ensures more continuity of funding and, for this reason, makes success and international recognition more possible.

The fragmentary nature of the European support for digital preservation research—partially mitigated by the not unusual opportunity for an institute and its researchers of being funded for years even if in different projects (as happened in the case of University of Urbino)—has strong and specific political

²⁴ “European Archives Group – EAG”, Accessed August 18, 2012, http://ec.europa.eu/transparency/archival_policy/eur_arch_group/index_en.htm. The working group is based on the participation of National archives directors. The main activities have concerned the creation of a European archival portal (Apenet, now Apex), the database of European archival legislation Euronomos (in cooperation with the ICA European Branch EURBICA), the definition of guidelines on the thefts of archival materials and other studies. Relevant goals and actions, but not sufficient for building a strategy and a solid and persistent infrastructure.

EU reasons, which cannot be easily overcome even if in the European Research Framework new perspectives have been identified and could be able to create a radical and positive evolution in the near future. It is moreover clear that many other factors contributed to maintain the present situation, specifically characterized by isolated projects and by difficulties in creating fruitful interconnections and supporting an effective strategy:

- The market and the stakeholder interests are relevant, variegated and conflicting and, also for this reason, the differentiation of the investments is prevailing in the evaluation process;
- Archival institutions, which are involved (even if they are not numerous) in the European projects, have not been able to develop a common strategic leadership and promote a coordinating action; the other institutions which have not been involved not seem even aware of their exclusion in the last decade of European funding.

With particular reference to the last point and to the obstacles which have further limited the effective cooperation in Europe among archival institutions, many elements have to be considered. They include:

- The institutional resistance and reserve about working on single projects without insurance for continuity, while (or because) they are facing other dramatic, still open and unsolved challenges (such as the documentary proliferation and the complex problems related to e-government initiatives both in the legislation and in the national governmental implementation);
- The difficulty of and the delay in conjugating the institutional activity for protection and custody of archival sources with the scientific investigation and in cooperating with the research initiatives conducted by the academic institutions;
- A traditional autonomous attitude attested in the past by the delay in supporting standardization processes;
- A passive acceptance of the European policies established in the period 2005-2007 focused on principles of convergence and interoperability of the digital cultural heritage;
- The underestimation at European and at national level of the problems related to the preservation of digital archives and to the need of building an early and consistent network of custodial institutions, which are authoritative, reliable, certified, trustworthy and neutral. It should be sufficient to remember the very recent proposal of the European Commission to modify the regulation related to the European historical archives²⁵ with reference to the removal of the obligation of transfer to the central archival repository in Florence for the European institutions when the records are digital: in this case the creators, according to this new proposed rule²⁶ and against any consolidated archival principle, will maintain their complete responsibility for ever (“the originating institutions will remain responsible for the long-term preservation of their digital

²⁵ “For a Council regulation amending, Reg. (EEC/Euratom) No 354/83, as regards the deposit of the historical archives of the institutions at the European University Institute in Florence”, Accessed at August 24, 2012, <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:DKEY=687809:EN:NOT>.

²⁶ The annex related to the provision for the deposit of the historical archives of the European Union institutions makes only explicit that “in the case of digital archives, the EUI shall have permanent access to the documents in such a way as to allow it to fulfill its obligation to make the historical archives accessible to the public from a single location and to promote their consultation”, *ibid*.

archives”). Because no other rule is defined with respect to this responsibility, the Commission proposal seems to completely ignore the risks of losing control over the quality and the integrity of the records when they are no longer active (and relevant for the creators) and are not yet (and perhaps will never be) transferred to dedicated *trusted* archival repositories. As stressed by Angelika Menne Haritz, when the proposal was discussed at the EAG meeting in October 2011, because “digital archives are not fixed,” only the custody in archival repository assigned to third neutral parties is able to guarantee that “these archives will not change after they are opened to the public.”²⁷ The decision of the European Commission is in patent contradiction with the main results of the research projects funded by the Commission itself, explicitly in favor of the creation of certified institutions dedicated to the digital preservation as the essential requirement for long-term preservation.

From this point of view the archival institutions, the absence of archival competences and knowledge in the European research for digital preservation determined, among other consequences, that many research questions, which are still relevant and critical for the domain, have not yet found an adequate and systematic analysis and risk remaining unanswered (and sometimes also unexpressed). Only some of them can be here listed:

- How should one apply OAIS in the archival domain?
- How should one transform the archival requirements for information representation and the specific references to contexts and complex relations into the digital library standards without losing the intelligibility of the digital objects made available on the web?
- How should one develop services able to document the custodial history in the transfer processes?
- How and when should one document the authenticity evidence and who would be responsible for its maintenance?

These questions (and many others) are urgent and cannot find adequate answers if the institutions are left alone. It is not by chance that recently, thanks to the request of some European governments and, specifically, of Slovenia, a specific action concerning *long-term data archiving* has been finally proposed to the European Commission (*Proposal for support of eArchiving in CIP ICTPSP WP12*) and partially accepted. The focus is—at the moment—limited to the transfer of custody for digital archives disposed for long-term preservation as proposed by Jože Škofljanec (Archives of the Republic of Slovenia) at the first meeting. This meeting was held in Luxembourg in February 2012 with the participation of many archival stakeholders and experts for digital preservation and the proposal was presented with the following motivations: “the level of digital preservation is very different among member states; (limited) practical experience is available; pan-European standardisation is taking place in the field of RM (MoReq) but not regarding ingest procedures.” The Slovenia proposal was promptly supported by all the archival institutions of many European countries (among others Austria, Denmark, Estonia, Finland, Italy, Hungary, Latvia, Netherlands, Norway, Portugal, Spain, Sweden, UK) and the experts involved in this internal workshop. The project obtained the recognition of its relevance when the government representatives met some months later. The basic request concerned the increase of efforts and support for

²⁷ European Archives Group – EAG, Minutes, accessed August 18, 2012, http://ec.europa.eu/transparency/archival_policy/docs/eag/cr/111007_minutes_en.pdf.

developing guidelines and common tools (that is, fewer projects and more coordinating actions, programs and working groups). Specifically, the final report made explicit the need for “common set of guidelines and tools for transfer and ingest processes and formats in line with European interoperability initiatives” to make available to the member States “simple pan-European access tools and e-services – strengthen reuse.” A pilot project is now planned in the form of a call for a proposal for “developing and piloting eArchiving service solutions, the necessary technical infrastructure, policies and processes to support the preparation and transfer of content and its ingest to repositories, ensuring its authenticity, provenance and integrity over time as well as its continued availability and usability”—in synthesis for implementing “scalable sustainable practical eArchiving services.”²⁸ Of course, the recognition of the critical value of this topic does not imply a correct archival solution. The risk of delegating the main preservation problems (such as authenticity and integrity) to technological mechanisms is always around the corner, as was made evident by the Italian legislation approved in 2004.²⁹

2. The methodological contribution of the archival knowledge for digital preservation research

From the methodological point of view, the most relevant open question concerns the concrete and specific content of the contribution that the archival domain should be able to provide to the research dedicated to the digital preservation. The answer can be found by analysing the results of the European researches and, specifically, their main weaknesses. Of course, there are no parameters for identifying such deficiencies and no metrics available to support such analysis. Evidence for this risk can be found in the APARSEN deliverable for work package on authenticity and interoperability.³⁰ On this occasion the researchers had to revise dozens of deliverables and reports published by recent European projects dedicated to digital preservation and were able to verify how limited at the moment the investments (internal to the projects) are for the definition of a project’s stable vocabulary and for a systematic conceptual framework³¹ and how difficult is to orient users without such tools which be able to function as *protocols of understanding*.

On the contrary, both the terminology and the conceptual framework are fixed ideas, even an obsession, for the archival community, specifically when they operate at the international level. There is no doubt about the capacity of the documentary disciplines and, in particular, the archival science, to provide effective contribution to this activity, specifically for the creation of a theoretical outline. The international experience matured by the archival community on this subject is long lasting and well qualified (as it will be later explained).

²⁸ Cfr “Orientations for CIP ICT PSP WP2013” (internal document) and in particular the point dedicated to “Scalable sustainable practical eArchiving services”.

²⁹ See Maria Guercio, *Archivistica informatica* (Roma: Carocci, 2010), chapter 5.

³⁰ APARSEN Project: Deliverable 24.1. Report on Authenticity and Plan for Interoperable Authenticity Evaluation System, 2012, Accessed August 22, 2012, http://www.alliancepermanentaccess.org/wp-content/uploads/downloads/2012/04/APARSEN-REP-D24_1-01-2_3.pdf.

³¹ It is frequent to meet new and specific glossaries, created for each deliverable and developed by simple accumulation of terms of various provenances. Even the compliance with recognized standards is not always required or pursued. Of course, building and sharing vocabularies is a very complex and ambitious task: it is never a question of collecting terms, but it implies a strict control of the relations and, more important, their contextualization. The agreement among co-authors is also a very demanding work.

With reference to the conceptual framework, someone could object that digital preservation systems already follow a standardized reference model, which is at the same time both consolidated and flexible, that is the OAIS model. This model is very important and generally appreciated both when general rules have to be developed (see the case of Italian legislation under approval³²) and when a digital repository has to be created and implemented (as in the case of Regione Toscana which is presented at the conference by Ilaria Pescini paper) or reconsidered (again, as in the case of e-health standard for Italian government, UniSInCRO³³). This model is today and will remain for a long-time the benchmark for digital preservation projects, but (also because of its nature necessarily open, flexible and abstract), it is unable to meet more specific requirements. The critical aspects regard not only the sectorial, domain-dependent vocabularies, but also the conceptual structure needed for sustaining in the daily life of the digital resources the implementation of the main categories of Preservation Descriptive Information (provenance, reference, context and fixity). These categories are very often difficult or impossible to handle separately. A robust methodology is required to avoid ambiguities and overlapping.³⁴ It is not by chance if the just published release of OAIS has reinforced its relationships with some archival concepts, such authenticity, even if it developed in a peculiar manner.³⁵

In particular, the authenticity is a very crucial subject, increasingly recognized for its centrality among the concepts commonly used and referred to by the communication, information and knowledge society. The information society by its nature directly works on the creation and narration of social and individual identities and, for this reason, requires tools, procedures and fundamentally robust concepts for entrusting and documenting their authenticity specifically when facing the digital world challenges. Moreover, the authenticity in the sense of identity of the resources and their integrity has not by chance been developed by the documentary disciplines. It has been creatively and thoroughly analysed by Paola Carucci³⁶ with reference to the contemporary records and investigated for the digital environment by Luciana Duranti and other InterPARES researchers.³⁷ The knowledge and the experience of archival

³²“Regole tecniche di conservazione di documenti digitali”, <http://www.digitpa.gov.it/sites/default/files/Bozza%20-%20Regole%20tecniche%20conservazione.pdf>, accessed September 5, 2012.

³³ Uni 11386:2010 – “Supporto all’interoperabilità nella conservazione e nel recupero degli oggetti digitali (SInCRO)”, Accessed August 22, 2012, <http://webstore.uni.com/unistore/public/searchproducts>

³⁴ To make these concepts practically applicable in preservation cross-domains environment, a double exercise is required. First of all it is necessary to translate/accommodate them into the OAIS framework, specifically into the information package relevant for handling digital content preservation, the Preservation Description Information which includes Reference, Context, Provenance and Fixity Information. Of course, this ‘translation’ is not automatically extensible: an interpretation is required based on the definition of resource typologies and linked to specific domains knowledge. Some contradictions among OAIS PDI categories still require to be solved, as in case of the reference information: for archival records this concept implies identifiers of various levels (persistent identifiers, but also registry, classification code) and includes context information like archival bond while OAIS defines context as a separate area of PDI (the relationships of the Content Information to its environment, i.e., why it was created, how it relates to other Content Information objects, etc.).

³⁷ See, among other, Luciana Duranti, Terry Eastwood, Heather MacNeil, *Preservation of the Integrity of Electronic Records* (Dordrecht: Kluwer Academic Publishers, 2002), Chapter 1; Luciana Duranti, Heather MacNeil, ‘The Preservation of the Integrity of Electronic Records: An Overview of the UBC-MAS Research Project,’ *Archivaria* 42, no. 2 (1997): 46–67; Heather MacNeil, *Trusting Records. Legal, Historical and Diplomatic Perspectives* (Kluwer Academic Publishers, Dordrecht, 2000).

institutions and scholars are in this respect undoubtedly central and the concept of authenticity is undoubtedly central for the research on digital preservation and for building measures and tools for trusted digital repositories of any type.

Another sector where the archival contribution is substantial and unavoidable—as, at the end, was also by the information scientists involved in the research environment—concerns the use of principles, concepts and tools borrowed from the *record management*. This also includes recommendations and standards developed in the course of the last decade by ISO committee on archives and record management and by ICA. Among other things, they concern the recognition that the digital preservation, intended as dynamic process for digital continuity, can be sustainable and can be handled only on the basis of information lifecycle management or in the form of digital continuity because of standardized and well controlled vocabularies consistent with the functional model which governs the information phases and layers. From this point of view OAIS is the essential reference model, but—as previously underlined—is not self-supporting when consistency of contents is required.

With reference to the global research on digital preservation, conceptual frameworks, well defined vocabularies, contextualized concepts should be further developed and discussed if a real and effective interdisciplinary approach would be supported for improving the general investigation methodology. They are fundamental requirements for any successful project, specifically when the sector is undetermined and in continuing transformation as the digital environment is. As was underlined years ago by Seamus Ross in his keynote speech at the Budapest conference on digital libraries, the digital contents in any domain “require knowledge of its context of creation, and they demand evidence of its provenance. These are processes to which archives respond well because they have developed an appropriate theoretical framework and have operationalised it in repository design, management and use over at least three centuries. The archival framework meets requirements surrounding the production, management, selection, dissemination, preservation and curation needs of information. It also supports a layering of services from repository services at the foundation to user services at upper levels.”³⁸ As been noted, this archival framework has been further developed and standardized in the last decade both with reference to the vocabulary and to the functional model by the theory of electronic recordkeeping and the standardization processes developed in this sector, thanks to the cooperation of a large international community based on ISO and ICA initiatives, has provided a significant contribution to support the collection of relevant information for integrity and identity of digital resources in the creation and preservation processes. In general, this effort (which is not necessarily linear, but on the contrary is very often conflicting and contradictory) is still operative and implies working groups at national and international level and thorough knowledge from each domain.

With specific reference to the authenticity, a rich archival literature has been developed, based on the InterPARES research and its *template for analysis*. Nevertheless, not many European projects have used this reference structure. The only exceptions have been CASPAR and now APARSEN³⁹ which have

³⁸ Seamus Ross, “Digital Preservation, Archival Science and Methodological Foundations for Digital Libraries” (keynote speech presented at ECDL Budapest 2007), p. 8. Accessed August 18, 2012, http://www.ecdl2007.org/Keynote_ECDL2007_SROSS.pdf.

³⁹ This analysis has been discussed by the author in the deliverable D24.1 of APARSEN project: Silvio Salza, Mariella Guercio, Monica Grossi, Stefan Pröll, Christos Stroumboulis, Yannis Tzitzikas, Martin Doerr, Giorgos Flouris, “D24.1 Report on Authenticity and Plan for Interoperable Authenticity Evaluation System,” April 2012, accessed August 18, 2012, http://www.alliancepermanentaccess.org/wp-content/uploads/downloads/2012/04/APARSEN-REP-D24_1-01-2_3.pdf.

integrated, thanks to the presence of archivists involved in the research and of course with the support of experts of OAIS functional model, the template elements into OAIS. The other European projects, even those which had the authenticity management as part of their crucial requirements, have not proposed original solutions and have normally ignored the question and its definition. This lack of interest is not easy to understand and even more is difficult to justify, specifically because today terms such *trust* and *reliability*, at the centre of any research and any debate on digital preservation, acquire their intelligibility and resonance, if and when they can be concretely measured against the capacity to verify or, at least, presume the authenticity of the digital resources to be preserved. The same question is at the basis of any digital certification process of digital repository.⁴⁰ The question of authenticity and how the research projects are or not normally able and/or willing to handle it can be emblematic of the present tendency to overcome the critical factors by ignoring them, instead of sustaining the effort to identify the nature of the problems, the complexity of the actions involved and the related responsibilities on the basis of the operational contexts.

The need for consistent and reliable vocabularies is again central (but of course cannot be handled as an accumulation of terms). They make the research results intelligible, measurable and exchangeable and allow for the continuity of the investments and the research work done. As already has been said, the archival community had a strongly commitment in this area. The promotion of a consistent archival terminology has been, not by chance, a key point of the initial program for ICA when launched by the director of US National Archives, Solon J. Buck, in 1946 and still is at the center of ICA attention.⁴¹

3. The future of the European action: New opportunities within the Common Strategy Framework

The European bodies are certainly aware of the limits and of the challenges still open at the present state of their investments and which are here only partially listed and discussed. One of the main qualities of their policies is the capacity to continuously update their high level evaluation processes. More complex is the transformation of the intermediate decision level, specifically when the challenges involved are even difficult to be defined and to be designed for future strategies. An important (even if not decisive)

⁴⁰ See on this aspect APARSEN Project: Deliverable 24.2. Implementation and testing of an authenticity protocol on a specific domain, 2012, Accessed August 22, 2012, http://www.alliancepermanentaccess.org/wp-content/uploads/downloads/2012/04/APARSEN-REP-D24_2-01-2_2.pdf.

⁴¹ The Buck roll call, titled *A Proposed Archives Program for the United Nations Educational, Scientific and Cultural Organization* (September 1946) is published as annex in the article of Oliver W. Holmes, "Towards an International Archives Program and Council, 1945-1950," *American Archivist* 39, no. 3 (1976): 296-299. See on this aspect Giulia Barrera, "Il villaggio globale degli archivisti. Organizzazioni internazionali e forme di cooperazione tra gli archivi del mondo," in *Archivistica*, ed. Linda Giuva and Maria Guercio (Roma: Carocci, in press). The ICA has dedicated time and financial resources to develop and update its dictionaries. The first dictionary was published in 1964: *Elsevier's lexicon of archive terminology: French, English, German, Spanish, Italian, Dutch*, compiled and arranged on a systematic basis by a Committee of the International Council on archives (Amsterdam - London - New York : Elsevier, 1964). A second series of tools has been published in many languages: *Dictionary of Archival Terminology: English and French, with Equivalents in Dutch, German, Italian, Russian, and Spanish = Dictionnaire de terminologie archivistique*, ICA handbooks series, 7, 2nd rev. ed., ed. Peter Walne (München - New York: K.G. Saur, 1988). A third edition completely renewed with contextualized definitions developed in 2004 was only published on the web by Angelika Menne-Haritz, Accessed August 20, 2012, <http://www.staff.uni-marburg.de/~mennehar/datiiii/intro.htm>.

step in this process was the EU workshop held in Luxembourg (Shape New Visions for EU-Research On Digital Preservation, May 4-5, 2011),⁴² with the participation of many European and North American researchers and experts in the field, invited for defining the new vision for EU research on digital preservation. The final report recognized that:

There was not yet a corpus of best practice to refer to. These communities were not, however, well connected, and had not yet engaged widely beyond public memory institutions and research bodies. There also appeared to be lack of dialogue between digital preservation specialists and those who produce and curate data.⁴³

The results of this workshop, by recognizing (even if partially) some of these needs, suggested:

- Shifting the attention from the preservation of data to the preservation of knowledge: this shift would be “be able to demonstrate the authenticity of preserved data,”
- Focusing more on the integration of digital preservation into lifecycle management of digital contents as proposed a decade ago by the record management and archival science scholars.

These two conclusions seem to confirm what was previously observed with reference to the areas where the contributions from the archival community could have been more than productive. The workshop provided many other opportunities for discussing all the open questions in the field, even if many aspects were not debated at all, specifically those of strategic value. For instance, the report in any way did not include, in the list of missing actions, the creation of reference centers or networks for the definition of rules, services, procedures, tools and also methods, even if similar ideas are present in projects like APARSEN (Virtual Center of Competence)⁴⁴ or in PLANETS (Open Planets Foundation).⁴⁵ The eArchiving pilot proposal (see above) can also be interpreted as a first recognition of this weakness, in this case specifically referred to the archival domain. It will be the responsibility of the European archival institutions to transform this tepid credit opening into a real opportunity and an occasion for collecting

⁴³ Clive S.G. Billness, “Report on the Proceedings of the Workshop The Future of the Past. Shaping New Visions for EU-Research On Digital Preservation,” organized by Cultural Heritage and Technology Enhanced Learning, Luxembourg, May 4-5, 2012. Accessed August 19, 2012, http://cordis.europa.eu/fp7/ict/telearn-digicult/future-of-the-past-summary_en.pdf. See also the report presented at the workshop, Stephan Strodl, Petar Petrov, Andreas Rauber, “Research on Digital Preservation within Projects co-funded by the European Union in the ICT Programme, 2011,” Accessed August 20, 2012, http://cordis.europa.eu/fp7/ict/telearn-digicult/report-research-digital-preservation_en.pdf. The report presents an overview of the past and present European research projects. It is interesting to note that it is recognized that in the first phase (Delos and ERPANET) a significant effort was developed - under the influence of the library and archival communities - for the “establishment of common problems, definitions, terminology and concepts” (p. 52), while in a second phase the attention was (and is) concentrated on non-traditional objects and on more technical aspects, with less attention to the development of common bases. By illustrating the outputs and topics of the funded European projects, the report makes evident, even if not explicitly, the fragmentation of the whole picture. It is useful to stress that only two archival experts were invited to the workshop and the awareness that this absence could have produced a negative impact on the definition of a more complete strategy was not at all expressed in that occasion.

⁴⁴ “Aparsen - Alliance for permanent access to the records of science network,” Accessed August 22, 2012, www.alliancepermanentaccess.org/current-projects/aparsen.

ideas and proposals and creating the basis of an effective network or of a virtual center of archival competence.

Another important initiative, which should attract the future attention of the stakeholders, is the new European financial infrastructure proposed for the period 2014-2020, specifically with reference to the definition of a Common Strategy Framework for innovation and research and to the future plans included in the program called Horizon 2020.⁴⁶ In relation to the aim of “Connecting Europe Facility (CEF)—cross-border infrastructures in energy, transport and ICT to strengthen the internal market” the new program defines the need to reinforce with adequate research resources “*competence centres on digitisation and preservation of digital cultural heritage*.” The European and international networks for cooperation are here indicated as strategic tools. These changes could provide new possibilities for overcoming the old critical difficulties but the challenges (which were not faced in the past as has already been indicated) will be even more complex in the near future and will require great capacity for cooperation, clear ideas and qualified alliances. The present is characterized both by the instability of the technological innovation and the complexity of the creation of digital contents, but also by the continuing growth in the development of digital data which is “outstripping the rate of growth in data storage technologies.” This uncertainty can be faced or at least limited with contextualized definitions of solid basic concepts and with a persistent coordination among qualified institutions, possibly characterized by common goals, even if the dynamic nature of the digital environment will never stop in provoking new conflicts and creating new uncertainties. The digital environment imposes (not only in case of digital heritage) undefined boundaries and *seems* to make irrelevant the traditional specificities, but implementations in the real world does not accept a high percentage of ambiguity as has been increasingly recognized in the recent debate on postmodernism decline.⁴⁷ Good methods, good concepts, consistent vocabulary cannot be provided when the knowledge is not well developed and openly discussed and if the boundaries are still unclear or even completely unknown. These challenges cannot be faced by any research sector involved in the digital preservation without a contemporary double investment both in strengthening its own domain knowledge and competences and in supporting adequate and qualified cooperation processes.

Of course, many of the questions here proposed do not concern only the European institutions and, naturally, are not confined to the archival world. These demanding and global challenges involve the whole international scientific community at large, specifically scholars and professionals involved in the research and in the implementation actions. For this reason, it is more than probable that our academic and professional communities will not waste any possible present and future opportunity for strengthening their cooperation. But to reinforce their will and their reasoning capacities, it is important to recognize that not all the efforts already made are in the right direction and that it is essential to recover, with a stronger will and more intellectual consistency, the precious scholarly assets accumulated in our scientific studies and technical practices.

Models for National Collaboration

Coordination of the Digital Cultural Heritage in Sweden

Rolf Källman

The National Archives of Sweden

Abstract

On the basis of the national cultural policy, the European council conclusions, the responses from the heritage institutions and the digital agenda for Sweden - ICT for Everyone, the national strategy for digitization, digital access and digital preservation was established by the Swedish Government in December 2011. The aim of the strategy is to regulate the work for the government agencies and institutions that collect, preserve and make cultural heritage information available for the end users and furthermore to increase digitization and accessibility and to enhance digital preservation of digital cultural heritage holdings and collections online. In order to coordinate the continued development work on digitization issues, and coordinate the activities connected to the National Digital strategy, within the timeframe of 2012-2015, the government has established a coordinating secretariat for digitization, digital preservation and digital access to the cultural heritage – Digisam.

Author

Rolf Källman is Head of Department at The National Archives of Sweden, responsible for Digisam, the Swedish national secretariat for coordination of digitization, digital preservation and digital access to cultural heritage. Rolf has for more than 30 years worked with cultural heritage and heritage information in local, regional and national museums, and national authorities. For the last 15 years he has in various positions been engaged in the work with accessible and usable digital heritage information.

1. Introduction

For hundreds of years the cultural heritage information have been separated and handled in the frames of different academic disciplines. That has in many ways been a successful way to deepen the knowledge about our heritage, but in the perspective of the end users it has led to difficulties when it comes to search and retrieve complex cross domain information. With the rapidly growing amount of creative web based tools it has now become possible to promote access for everyone, researchers as well as pupils or the common interested citizen.

What happens when the collections and holdings held by archives, museums and libraries is digitized and how does it affect the daily work at our institutions when the digital born material rapidly grows? In what questions is it necessary to coordinate the work on a national level and work differently than in the past? And how can we make best use of powerful digital tools to gather, communicate and communicate our common heritage? These are some of the questions that Digisam—Swedish national coordination of digitization, digital preservation and digital access to cultural heritage has been commissioned by the government to manage.

In Europe, as in the rest of the world, digitization of our common cultural heritage is pointed out as a highly important business for knowledge building, amusement, democracy, innovation and economic growth.

This is clearly stressed in the European digital agenda, an important document within the framework of EU 2020, the European Union's strategy for economic growth, European Council Conclusions and ICT strategies on a national level.

The two most important Council Conclusions for the work with digitization of the cultural heritage is on Europeana, and on the digitization and online accessibility

of cultural material and digital preservation. It is here pointed out that it is essential to enable access for all to culture and knowledge in the digital era and to promote the richness and diversity of European cultural heritage which is an important resource for European cultural and creative industries, for contribution to economic growth and job creation and to the achievement of the digital single market through the increasing offer of new and innovative online products and services.

Common goals and broad cross boarder collaboration as a necessary platform is widely accepted among the member states. Europeana is established as the most important common platform and a strong and growing network. Europeana is the access point for European digital heritage and the natural environment for creative development and handling challenging questions that has to be solved along the line.

A necessary fundament for Europeana is a well organised technical infrastructure for digitization on national and regional levels.

The rapidly growing digitization is of course supported by the ongoing technical development, but to reach the goal of a free accessible and usable digital cultural heritage much more is needed

Digitization is a complex business that starts with strategic decisions and steering on a management level, and involves digital production with necessary steps taken for preservation and usability. The aims are of course clear defined effects in the society. This may sound trivial and commonly accepted, but when you look more closely into the single digitization projects on a national or a local level it becomes obvious that too many projects have not taken all the necessary steps into consideration with minor, to severe, negative consequences as a result and that lack of plans for long-term management and preservation jeopardizes tangible values and investments made.

The digital development gives the memory institutions and state media companies new opportunities to give citizens access to and use of cultural heritage. That is a strong statement in the Swedish national strategy for digitization, digital preservation and digital accessible cultural heritage materials and cultural information, the government has decided.

2. Towards coordination

In November 2009, the Swedish Government initiated the process aiming at a national strategy for digitization of our common cultural heritage.

A total of 27 cultural heritage institutions (archives, libraries and museums) under the rule of the ministry of culture and the ministry of education were assigned to deliver information and basic data for a strategy. Furthermore, 21 regional institutions responded to the invitation to contribute.

The responses varied a lot and were unfortunately difficult to compare with one another and it was therefore not possible to fully analyse and draw the picture of the situation as a whole. What was clear though was a lack of, but strong wish for, coordination and cross domain collaboration. It means that something has happened in the last 5-6 years. At that time, a common comment from memory institutions was that it was not relevant to coordinate their systems with other institutions because they had special and specific needs because since their collections were special and differed from other institutions. There

are several reasons for the changed attitudes and why the vast majority of the institutions today argue for the need for coordination on the basis of the lowest common denominators. Rising costs for IT management is one of the reasons, but primarily increased IT maturity and user requirements for seamless search and usability are the driving forces.

A lack of common terminologies was also obvious. The responses showed for example that the term digitization was used with different meaning, and was sometimes used for all kinds of IT-supported processes. The responses also showed a need for greater coordination within the field of standards, terminologies, infrastructure and long-term preservation of digital information.

3. A National Strategy for Digital Heritage

On the basis of the national cultural policy, the European council conclusions, the responses from the heritage institutions and the digital agenda for Sweden - ICT for Everyone, the national strategy for digitization, digital access and digital preservation was established by the Swedish Government in December 2011.

The aim of the strategy is to regulate the work for the government agencies and institutions that collect, preserve and make cultural heritage information available for the end users and furthermore to increase digitization and accessibility and to enhance digital preservation of digital cultural heritage holdings and collections online.

The strategy covers the whole range of digitization issues, from priorities to preservation and use. The focus is on the opportunities that digitization offers for use, reuse, participation and creativity.

Apart from fulfilling the commitment that follows with the conclusions in the European commission concerning Europeana, one of the government's cultural policy priorities, heritage for the future, underlines the importance of the digitization of our common cultural heritage. The Swedish culture policy also stresses the need for the government to continue efforts to digitize, preserve and disseminate cultural heritage

In the strategy it is decided that all government agencies and institutions covered by the strategy shall deliver plans for digitising and make their archives, collections and libraries available to the citizens. Digisam's role is to support them in their work by coordination and general guidance. The plans are stated to include selection criteria priorities, and the planned volume of digitized material is to be presented.

4. Digisam – a secretariat for National coordination of digitization, digital preservation and digital access to cultural heritage

In order to coordinate the continued development work on digitization issues, and coordinate the activities connected to the National Digital strategy, within the timeframe of 2012-2015, the government has established a coordinating secretariat for digitization, digital preservation and digital access to the cultural heritage—Digisam. Digisam started its work in the autumn of 2011 and is organized as a department at the National Archives. The main task is to promote the achievement of the objectives of the national strategy for digitization.

General guidelines, proposals for responsibility and how an integrated digital information management and a coordinated and cost-effective preservation should be designed are also key issues for Digisam to handle.

Digisam is therefore assigned to be a broad resource for questions about digitization, digital preservation and digital accessibility and will:

- Monitor and evaluate the institutions work within the task of the national strategy
- Work with issues of standards and systems for digital preservation,
- Conducting business intelligence, and collect and disseminate current research in the field of digitization and otherwise support the authorities and institutions
- Establish and arrange contacts with relevant organisations and private actors
- Work with and inform the participating authorities and institutions on the relevant issues of intellectual property rights
- Participate in working groups within the EU dealing with issues of digitization
- Explore possibilities for EU funding
- Provide support with communication, and seminar and training courses to participating agencies and institutions

It is important to underline that though Digisam is set up in the National Archives, its task is to be a resource for all state agencies, institutions and interested media companies in the field of cultural heritage.

Digisam's mission is focused on the state authorities and institutions, but the goal is that the results of the work will be beneficial and useful for anyone working with digitization and use of digital cultural heritage information. Therefore Digisam invite representatives from the private sector and civil society with an interest and involvement in digitization issues to participate in the work.

In the assignment to Digisam, the government has pointed out three key issues that are important to handle if the overall target is to be achieved. Those are common standards, priorities and usability

The government also has defined the deliverables as follows:

- Present recommendations for coordinated digital information management of collections and holdings.
- Develop proposals for cost-effective long-term digital preservation of collections and holdings.
- Define roles and responsibilities for the work on aggregation, access and preservation of digital cultural heritage information.

5. Collaboration between Digisam and the memory institutions

In the dialogue with the memory institutions, they accentuate steering and supporting guidelines for the selection of standards, formats, priorities, support for handling copyright issues, etc., as high on their wish list. The question that most institutions point out as the most difficult is the long-term preservation of digital information. Without secure and stable solutions for conservation, we cannot guarantee an accessible, use and re-use of heritage information neither today nor in 500 years. But how coordinated and cost-effective solutions for conservation to be designed are not obvious. The National Archives of course have a long experience within these matters which will be very useful in the continued work in collaboration with Digisam.

Preservation is just one of the issues where European cooperation is important. By participating in the joint work with Europeana and other projects and contexts, we can contribute to and benefit from a shared knowledge building and avoid reinventing the wheel, have extensive networks and funding opportunities. More Swedish heritage institutions need to be involved in European collaborative projects and Digisam hope to support such a development.

An important field of collaboration is of course the conversion process where analogue material is digitized. For various reasons it is sometimes necessary with small-scale and piecemeal digitization at a single institution, but in most cases there are considerable economic and rational benefits when digitization is made at large, more industrially organized production facilities, such as at MKC, the Swedish National Archives department for media conversion. On an average day about 100.000 digital is produced at MKC. *(not till <http://www.riksarkivet.se/default.aspx?id=19196&refid=1135>)*

Memory institutions have grown and evolved from their core of specific collections. . This means that the specificity of the collections has been the take-off point when systems and methods for managing have been chosen. When the digital tools were established at the institutions they came, in most cases only for use in the process of cataloguing and managing collections. It is therefore not difficult to understand that the systems were applied built to suit each institution's needs. There were not any collection systems to pick off the shelf.

On the road to a coordinated work within the field of digitization, preservation and use of digital information, the most commons needs that is highlighted by the institutions are common definitions and terminologies, common authorities and knowledge about the semantic web, support in IPR issues, long-term preservation, infrastructure and recommendations about almost everything.

6. How do we get there?

The list of all questions that need to be addressed in the context of Digisam's mission is long. We have a large and exciting task ahead of us to operate, collaborate, coordinate, inspire and be inspired. The only thing we know for sure is that it is essential to work close with all inside and outside the field of cultural heritage, who share our passion for these issues if we are to achieve the common objectives of the Swedish national strategy for digitization, preservation, accessible and usable digital heritage.

To achieve the objectives of increased digitization, preservation and use within established financial framework requires coordination and a clear allocation of responsibilities and roles. The strategy places the responsibility on the state authorities and institutions, but in order to reach the goals actors among the whole field of culture heritage institutions, public as well as private, and their collaboration partners, must be invited and involved in the work. A living used and re-used cultural heritage, today and tomorrow, is a concern of the whole society and therefore many voices must be heard.

On the highest level in the conceptual model we have defined the concepts steer, produce, use and preserve as central. This may seem obvious, but when look at the digitization projects that has been undertaken so far, we note that very few have taken all these four concepts in consideration. Very few of the digitization projects have started as an outcome of strategic plans, decided by the managements of the institutions. The institutions often holds a lot of knowledge and experience within the field of converting analogue data to digital, but too often the applied processes lead to either use or preservation and seldom take both these necessary outcomes in due consideration.

If Digisam reaches the goal of our mission, we by the year of 2015 have established the conditions, in a wide range of everything from infrastructure to practical advices for a successful work, for all actors involved in the complex issues of digitization. It is the archives, libraries, museums, other institutions and engaged citizens, with different missions and interests, that do the hard work making the information on our common cultural heritage accessible, usable and used. And it is they, the producers and users, that have the best prerequisites' to develop best use and benefits from new and old tracks. If Digisam shall be

able to support this, we need help from and to collaborate close with those who on different levels and with different perspectives are involved in the work.

7. Strategies

The most important strategy right now is to gather the state authorities and institutions that are targeted by the national strategy for digitization. A starting point for that is the plans for their digitization activities that they all have been commissioned to write. It is important that the plans will be powerful and effective tools for the single institution's work. And it is very important that the individual plans are interrelated. Digisam has offered the institutions to lead, coordinate and support the work with the plans. An important task in this process is to support the heads of the authorities and institutions to choose and define the necessary strategic decisions that has to be decided by the managements.

Interrelated plans as a common ground and consensus among the heads of the institutions, over the most strategic issues, will be a powerful tool in the work to come.

8. Challenges

Perhaps the greatest challenge of all is to think different. The technical development is today much faster than the development of creative use of information. And in the shift of perspectives and thinking it is important to be aware of not to, without reflection, copy an analogue way to work when it is transformed to a digital one. To look at the single institutions information as a part of a worldwide infrastructure is of outmost importance.

So there is definitely a need for a shift of focus. The building blocks in the knowledge processes are the data kept by the institutions. We have to accelerate our work with improvement of data quality with interoperability and sustainability as two of many important key words. A growing amount of linked open data leads to a necessity to review strategies and re allocate resources. The institutions need to see themselves as important nodes in a knowledge infrastructure. To raise quality of data is part of an ongoing information management, but the massive increase of large amounts of information is a resource-intensive work. Some data is also probably more important to improve the quality of than others, and here it is important to have clear strategies.

A strategy is to open up so that many more can join the work. And with the shift of focus follows a need for let go of control and invite other actors in the processes. Crowd sourcing is already a valuable tool, and the importance of and interest for it will probably accelerate sharply. The institutions have to play an important role as driving forces in the process to let in others and make good and innovative use of cultural heritage information that leads to surprisingly beneficial effects in the society.

9. The Users

On digitization follows that the public get a more open access to cultural heritage through the authorities, institutions and corporate archives and collections. It will also create more and new opportunities for research. Several of our memory institutions are now active in social media like Facebook, Flickr and Twitter where they share and discuss issues related to their collections and archives.

In many ways it is an open question who the users will be in the future. It's reasonable to assume that we will interact deeper and more frequent with our present user groups. But users and usage patterns change over time and with new open interfaces and possibilities to co-create we are likely to meet new user groups in situations that differ from the public areas we interact in today. What is definitely clear is that only imagination is the limit for the use of digital cultural heritage.

To a large extent the fact is that you ask for what you already know is available. We who works with cultural heritage information know that our institutions hold fantastically rich material that would be frequent demanded for if it was visible and accessible.

In this respect, students and teachers are most important user groups. Since cultural heritage information is an imprint of human activity in all its widths and depths, there are a rich potential for making use of heritage information in class rooms and learning tools. And for that a critical mass of information has to be made available as linked open data that can be used and put together in complex images and context in order to surprise us and create use and benefit where we least expect. And once again, to achieve that, long-term preservation is the key to and mother of used and re-used information.

Building and Preserving Library Digital Collections Through Community Collaboration

Victoria Reich

Executive Director, LOCKSS Program, Stanford University Libraries, USA

Abstract

Traditionally, libraries in the paper world were responsible for the safekeeping of much of society's cultural memory. They did this by building local collections, primarily to provide current local readers with rapid, convenient access to content. However, an important side effect of these local collections was a robust system for preserving the printed, and paper-based record for future readers. There were many copies of the content, on a durable, tamper-evident medium, under many separate administrations, with catalog systems capable of directing a reader to a nearby copy. Over the last two decades, the transition from paper-based publishing to Web publishing changed models for access and preservation for libraries. Instead of purchasing a copy, libraries now lease access to the publisher's copy. This has made preserving the contemporary published record more difficult, in these ways: Unlike paper, the publisher maintains the only legal long-term copies, and the publisher can alter or destroy them at will; Copyright law makes it problematic, if not impossible, to maintain other copies without specific permission from the publisher; Unlike paper, the copies are on a fragile, easily alterable medium with a short service life (magnetic disk or tape); Unlike paper, the format of the copies is expected to become rapidly obsolete. Preparations for this eventuality are expensive. The paper reviews these challenges, describing how the collaboration between libraries underlying the LOCKSS program enables each challenge to be addressed successfully.

Author

Victoria Reich is Executive Director of the LOCKSS Program, Stanford University Library, [www.lockss.org]. LOCKSS empowers libraries to locally archive and control their collections, ensuring perpetual access, local control and ownership, and the health and strength of the library community. Over 500 publishers participate in LOCKSS. Victoria helped to launch the CLOCKSS Archive and HighWire Press. She has extensive library experience, having held positions at Stanford University Libraries, the National Agricultural Library, the Library of Congress, and the University of Michigan. Victoria is on several Advisory Boards, including "Stanford Copyright & Fair Use". She received the 2008 Ulrich's Serials Librarianship Award.

1. Print Libraries as Preservation Systems

*"...the preservation of information resources is central to libraries and librarianship,"
and is a core value of our profession*

ALA, Preservation Policy 2001

In the paper world libraries are responsible for the safekeeping of much of society's cultural memory. They do this by building local collections, primarily to provide current local readers with rapid, convenient access to content. An important side effect of these local collections is a robust system for preserving the printed and paper-based record for future readers (Rosenthal 2005).

Proceedings of The Memory of the World in the Digital Age: Digitization and Preservation. An international conference on permanent access to digital documentary heritage, 26-28 September 2012, Vancouver, British Columbia, Canada, edited by Luciana Duranti and Elizabeth Shaffer (UNESCO 2013).

We tend to think of paper libraries as individual, stand-alone institutions. But if we think of the world's paper libraries as a network or distributed system of libraries, a different picture emerges. Viewed as a global system, libraries have attributes critical to their mission of preserving cultural memory that are not possessed by individual libraries. The important attributes of these paper library systems are:

- Highly replicated works have a better chance of surviving over many generations. The number of copies held by libraries reflects the importance of a work to various communities. More libraries hold the most important works, or most popular works implementing the meme; “lots of copies keep stuff safe”.
- Copies in libraries are distributed. The content is held by many libraries around the world, each under separate administrations, in countries with different laws, norms and customs. Some of these copies might be damaged by hurricanes, others by flood, earthquakes or fire. Others might be destroyed due to censorship, or accident. It is unlikely that all or even most copies of important works will be entirely destroyed, lost, or de-accessioned.
- Paper is a “tamper-evident” medium. It takes great skill to alter a printed book or journal in a way that does not provide obvious visual cues to the reader. Organizing personal visits to all the world's libraries to alter or destroy some book or journal article is difficult and expensive.
- Paper is a durable medium (Library of Congress 2012). Cotton papers and alkaline papers can last indefinitely.
- Paper libraries have local custody and control of their materials. Access is not dependent on continued payment and for as long as a library holds the title; their local clientele is guaranteed perpetual access. The purpose of preservation is to ensure content can be accessed.
- Libraries purchase and receive exactly what the publisher published. This is particularly true of content that's considered part of a library's “core collections”.

Despite the long and productive history of systematic cooperation among libraries, (an example is inter-library loan), the attributes described above that make the paper library system robust and effective in its role of preserving cultural memory were not deliberately created. Libraries did not have policies that mandated they cooperate to hold many replicas of publisher's content, in a highly distributed network, on a durable medium.

A primary motivation for paper library collections was to provide easy access for readers; an important business outcome of this practice is that paper libraries keep what they buy. The resulting robust preservation system of replicated copies was a fortunate accident enabling them to fulfill their charge to preserve access to the scholarly record for future generations.

2. Moving Safely from Print to Web

Over the last two decades, libraries have transitioned from acquiring paper-based collections to primarily leasing access to web-published ejournals and ebooks. The shift from owning paper collections to renting digital collections has had several disturbing unintended consequences. An unfortunate, simplistic implementation of web technology put libraries in a precarious and weakened position. Most libraries in the web environment are not fulfilling a traditional core social value; preserving their core collections for their future readers.

The move from paper to web has made preserving the contemporary published record more difficult in these ways:

- Most content is held by centralized organizations with limited redundancy and geo-political diversity.
- Copyright law makes it problematic, if not impossible, to maintain copies without specific permission from the publisher.
- Unlike paper, it is easy to alter digital copies with no trace or evidence.
- Unlike paper, the digital copies are on fragile, easily alterable medium with a short service life (magnetic disk or tape).
- Unlike paper, digital file formats are expected to become rapidly obsolete and many approaches to prepare for this eventuality are expensive (Kejser 2011).

3. Restoring Library Collection Infrastructure

The LOCKSS program (Lots Of Copies Keep Stuff Safe) a trademark of Stanford University, shows that a collaborative approach to the economic, legal, technical and social challenges of building and preserving library collections of digital content is both practical and economically sustainable. The program, founded in 1998, has low overhead and flexible commitments. The “Red Hat” model of free, open source software and paid support from libraries worldwide that use the system has kept the program in the black for more than five years with no grant funding.

In the web environment, most libraries rent access to electronic content. Leasing access to content puts libraries at risk; it outsources their duties as information stewards to third parties. A unilateral change of policy by the publisher or third party provider, or a failure to renew a subscription, can result in loss of electronic access to past material.

The LOCKSS Program, led and supported by libraries, gives libraries a way to preserve and control their own collections. Librarians use their local LOCKSS box to take custody of subscription and open access ejournals, ebooks, digitized collections, government documents, etc. A LOCKSS box is a library’s “digital stacks”, analogous to a library using its own buildings, shelves and staff to obtain, preserve and provide access to paper materials. The LOCKSS model restores libraries’ ability to build local collections, bringing the traditional purchase-and-own model to electronic materials and strengthening the library’s role in the digital age.

When libraries take custody of content to which they subscribe, access is separated from payment and perpetual access assured. Material stored in a local LOCKSS box remains available to members of the library’s local community even when the publisher goes away due to merger, bankruptcy, subscription cancellation, network outage or for any other reason. The content is always available to the local community, directly from the library, with no need to rely upon third parties. Locally owned collections guarantee 100% post cancellation access.

Copyright law makes it problematic, if not impossible, to maintain copies without specific permission from the publisher. Obtaining permission would be prohibitively expensive for libraries to do individually. When a publisher gives permission for the LOCKSS program to preserve their content, they give permission for all libraries that have authorized access to the content. There are many examples of a

single library negotiating with a publisher for LOCKSS preservation, to the benefit of all libraries in the LOCKSS network. As with paper libraries, the collaboration is implicit, not explicit.

Paper library collections consist primarily of materials received directly from the publisher. The libraries are providing to the readers what the publisher published. LOCKSS preserves what the readers sees on the web. The LOCKSS preservation approach is unique in delivering the publisher's original article, with the publisher's original branding and imprimatur. LOCKSS technology preserves the publisher's original content as of the date of web publication. The "look and feel" of the content, along with the publisher's branding, is preserved, resulting in an authentic representation of the authoritative source file. Readers see and use the most trusted, authoritative and contextually accurate version of important cultural materials.

Because the permission to collect and preserve the content is automatically granted to all authorized libraries, there are many libraries to share the cost of the technical work to get the content from the publisher. Again, as with paper libraries, the collaboration is implicit, not explicit.

The LOCKSS Program approach re-implements the key attributes of the paper library system, making it robust and effective at long-term preservation of our cultural heritage. A bit of cooperation among libraries that choose to take leadership and control has transformed seemingly intractable problems into successful solutions. Libraries take custody of content; they maintain local control of collections and assets. They keep what they buy and fulfill their duty to preserve access to the scholarly record for future generations.

4. Guarding Against Known Threats

In the paper world, many libraries each get a copy of a book. It is hard for a book to be accidentally or purposely destroyed because these many libraries are geographically dispersed, they are operated by many different administrations, under diverse political and cultural conditions. A primary motivation for paper library collections is to provide easy access for readers, however an important business outcome of this practice is that paper libraries keep what they buy. When considered as a network, these independent paper library collections resist damage; there is no central point of failure. Paper libraries fulfill their charge to preserve access to the scholarly record for future generations.

For digital materials, evidence suggests that human factors (intentional and unintentional) are the greatest cause of loss or corruption (Rosenthal 2011). Technology failures, economic failures and social failures also pose threats to the protection of digital content. When content is held in a single centralized repository, it is easy for someone to tamper with a master copy without detection. A dark archive, into which content disappears, only to reappear in a future emergency, does not engender confidence in either its availability or its correctness.

The LOCKSS network has similar tamper evident properties to print libraries. In the LOCKSS system, it is very difficult and expensive for someone to find and tamper with a significant number of the preserved copies without being caught. The copies are geographically distributed and independently held under many different administrations. Tamper-evidence engineering is a unique property of LOCKSS preservation and it is a keystone of our work (Rosenthal et al. 2005).

The LOCKSS Program is the only preservation approach that mitigates against the broad set of technical, economic and social threats to the security and long-term preservation of digital content. LOCKSS' ACM award-winning open-source technology is built on a peer-to-peer software infrastructure (Maniatis 2003) (Stanford 2012e).

It is unwise to trust closed source preservation systems; closed source systems are written and designed by employees operating under nondisclosure agreements. This constricted review limits opportunities to reveal software weaknesses and vulnerabilities that may interfere with preservation processes. Open source software supports cooperative, collaborative preservation systems in the following ways:

- Open source software is in itself a collaborative enterprise.
- Open source software is itself much better preserved, and much less likely to go obsolete, than closed-source software among other reasons because its copyright license terms encourage “lots of copies keep stuff safe” (Rosenthal 2009).
- Collaboration requires a degree of mutual trust, which is hard to sustain if no one can be sure what software anyone else is running. Open source software is transparent, in that anyone can read and experiment with the code.
- Open source promotes the use of open standards, and thus interoperability.
- Open source prevents vendor lock-in and thus contributes to keeping the cost of preservation as low as possible.

The LOCKSS peer-to-peer infrastructure requires that each library’s LOCKSS box cooperate with other LOCKSS boxes in the system to determine if content being preserved is what was originally collected from the publisher. If there are differences, the system repairs the content back to the authoritative version. The LOCKSS preservation processes employ implicit community collaboration.

The Blue Ribbon Task Force on Sustainable Digital Preservation and Access identified economics as the major threat to preservation (Blue Ribbon 2010). Even with optimistic projections of future costs, there is not enough money to preserve everything that should be preserved (Rosenthal 2012). This places particular importance on minimizing the cost of digital preservation systems, which has been a major focus of the LOCKSS Program since it was founded in 1998. Every unnecessary dollar of cost means more content that will be lost.

The community collaborates and shares responsibility for reaching out to publishers. The software is open source and has been contributed to by many in the community over time.

Multiple copies of content at different libraries audit each other and repair any damaged or missing content, eliminating the need for costly back-ups and manual auditing processes. The total system cost never appears on any one single budget and is thus never at risk from a single red pencil.

5. Cooperating for Robust Infrastructure

The LOCKSS Program builds your institution’s preservation infrastructure by re-implementing characteristics of the paper library system that enable libraries to keep society’s cultural memory safe in the digital environment. Librarians use the LOCKSS system to preserve content and to build their library’s local collections in two distinct networking environments, the Global LOCKSS Network and Private LOCKSS Networks. Local collections give libraries control over perpetual access for current readers and provide a robust preservation approach for future readers.

Librarians participating in the Global LOCKSS Network build and preserve open access titles and subscription ejournals and ebooks from over 520 participating publishers (Stanford 2012b). The Global

LOCKSS Network provides the digital equivalent to a library's general collections. (As with paper collections the publishers hold the intellectual property or copyright of these materials and libraries take custody of the materials for long-term safekeeping).

The Global LOCKSS Network leverages implicit cooperation among libraries worldwide. Sufficient replication is ensured because the materials preserved in the public network are those that the wider community has agreed they wish to preserve. The business relationship between the library and the publisher in the Global LOCKSS Network mirrors the print environment.

Private LOCKSS Networks are the digital equivalent of a library's special collections. The vast range of content genres preserved in Private LOCKSS Networks includes photo image collections, audio collections, government documents and databases. (For the most part, the libraries own the Intellectual Property or the copyright of the materials preserved in Private LOCKSS Networks).

Private LOCKSS Networks leverage explicit cooperation among a community of libraries that have common interests in specialized subject areas. These networks are highly targeted collaborative efforts among like-minded institutions sharing the preservation responsibility (including governance and sustainability) of e-content important to their institutions. Below are brief descriptions of several Private LOCKSS Networks, offered here as examples:

- Alabama Digital Preservation Network: Alabama libraries are collaborating to preserve a wide variety of historic archival materials, including image collections and databases (ADPN 2012).
- CLOCKSS Archive: Subscription and open access books, journals, and data are preserved in a network, spanning Europe, Asia and North America. When preserved content is no longer available from a publisher it is copied from the CLOCKSS Archive and made available for free, to everyone (CLOCKSS 2012).
- Council of Prairie and Pacific University Libraries: Consortium Canadian University libraries are collaborating to preserve collections important to the provinces of British Columbia, Alberta, Saskatchewan and Manitoba. This group has a particular focus on freely available born digital Web content including government documents, e-journals and small presses (COPPUL 2012).
- Data Preservation Alliance for the Social Sciences: Universities are collaborating to preserve social science data which include: opinion polls, voting records, surveys on family growth and income, social network data, government statistics and indices, and GIS data measuring human activity (Data-PASS 2012).
- Digital Federal Depository Library Program: Libraries in partnership with the U.S. Government Printing Office are working to ensure the distributed nature of the Federal Digital Library Program persists in the digital environment (Digital Federal Depository Libraries 2012).
- MetaArchive: Cooperative Run by the non-profit Educopia Institute, this international membership organization coordinates cultural memory organizations that are collaborating to preserve very high value locally created digital materials (MetaArchive 2012).

6. Building Distributed Digital Preservation Networks

The LOCKSS system was the world's first production quality Distributed Digital Preservation Network. Distributed Digital Preservation Networks are designed with intentional geographical and organizational

distributed infrastructures as essential components of their preservation models. The LOCKSS Program set best practices for reliable preservation and persistent access to digital content via content replication, geographic distribution, infrastructure heterogeneity, modularity and organizational diversity.

Distributed Digital Preservation networks require community collaboration and cooperation. It is not possible to achieve the required robustness to ensure the long-term persistence of digital objects through centralized technical or organizational approaches. Beware organizations that claim distributed digital preservation infrastructure when their technical implementation is a few back-up copies around the globe.

Implementing the LOCKSS Distributed Digital Preservation approach requires three actions: a publisher to give permission for the target content to be preserved; for a library to bring online a LOCKSS box that has authorized access to the content; and for that LOCKSS box to be registered with one of a number of associated LOCKSS Alliance networks (Stanford 2012d).

Publishers grant the LOCKSS system legal permission to ingest, preserve and access their intellectual content by putting online a LOCKSS permission statement. The LOCKSS permission statement is bundled with the content so that the content and the legal rights are preserved together. Paper contracts are hard to track through time, preserving the legal agreement with the contract minimizes any future misunderstandings.

The Global LOCKSS Network implements an extremely effective form of cooperative collection development. When one library or library group secures a publisher's agreement to participate in LOCKSS, all LOCKSS libraries with authoritative access to that content have permission to locally ingest and preserve the material.

A library uses the freely available, open source LOCKSS software to turn a mid-range PC, or virtual computing environment into a digital preservation appliance called a LOCKSS box (Stanford 2012c).

A LOCKSS box performs five main functions:

- It **ingests** content from target websites using a web crawler similar to those used by search engines.
- It **preserves** content by continually comparing the content it has collected with the same content collected by other LOCKSS boxes, and repairing any differences.
- It **delivers** authoritative content to readers by acting as a web proxy, cache or via Metadata resolvers when the publisher's website is not available.
- It provides **management** through a web interface that allows librarians to select new content for preservation, monitor the content being preserved and control access to the preserved content.
- It dynamically **migrates content** to new formats as needed for display.

LOCKSS Program staff at Stanford University analyses the target content's URL structure, file formats and delivery mechanisms. They design, implement and update a tailored, content-specific preservation action plan that serves publishers, librarians and readers.

The publisher permits the LOCKSS system to collect, preserve and provide access to the content by putting a LOCKSS manifest page on the content's website (Stanford 2012c). The manifest page contains a LOCKSS permission statement and links to the issues (or other parts) of the content as they are

published. The required manifest page is ingested and preserved with the original content and negates the need for paper contracts.

Software called a LOCKSS plug-in tells each institution's LOCKSS box where to find the publisher's LOCKSS manifest page, and how far to follow the chains of web links. A LOCKSS plug-in encapsulates a publisher's content model by listing parameters specific to each publishing platform. The LOCKSS team builds, tests and distributes plug-ins to LOCKSS boxes registered with the LOCKSS Alliance.

Every LOCKSS box is located at an IP address that falls within its parent University's IP address range. Authorized LOCKSS boxes independently collect subscription or open access content directly from the publisher's website. The publisher authorizes or denies a LOCKSS box's access to content through their access control system. Publishers register LOCKSS activity on their web logs and have access to real time statistics through their own systems.

Once ingest is complete, the LOCKSS technology ensures that each LOCKSS box has collected all intended content, thus preserving the authoritative version. The LOCKSS software continually monitors the content in each LOCKSS box to ensure it is properly preserved through a cooperative preservation process that compares one LOCKSS box's content with the same content on other LOCKSS boxes. When content is damaged or lost the system arranges for content repair from another LOCKSS box.

The administrator of each LOCKSS box can monitor the preservation status of the content in their box, by looking at delivered content and the management tools available through the LOCKSS box web administrative interface (Stanford 2012f).

7. Providing Continuous Access

An institution's LOCKSS box can provide readers with continual, seamless access to branded publisher content (Stanford 2012c). The LOCKSS system preserves content at its' original URL, critically retaining the content's relationship to other web resources. An institution's LOCKSS box delivers content to authorized readers only when the publisher's website is unavailable (subscription canceled, network traffic, publisher server down). The LOCKSS Program works to preserve and to deliver the publisher's original artefact to readers; in other words, what the publisher published.

LOCKSS boxes provide four main ways for readers to access the content they preserve: by proxying (i.e., acting like a web cache), by serving (acting like a web server) or by serving through integration with an OpenURL resolver, or the emerging Memento standard.

- **Proxying:** Institutions often run web proxies to allow off-campus users to access subscription content. Libraries that integrate their LOCKSS box into a proxy (PAC Files, EZ Proxy, ICP, Squid) ensure a reader's URL request is seamlessly fulfilled when the content is unavailable from the publisher's website.
- **Basic Serving:** In the basic serving model, articles are accessed using a local URL pointing to the LOCKSS box. The LOCKSS box checks if the publisher will provide content to fulfill a reader's request. If the content is not available from the publisher, the LOCKSS box serves its own copy to the reader.
- **OpenURL Serving:** Libraries can integrate their LOCKSS box with their library catalog and OpenURL resolver by adding their LOCKSS box as a target to an OpenURL Resolver.

- Memento: The Internet Engineering Task Force (IETF) is in the process of standardizing Memento, a mechanism created by Michael Nelson and Herbert van de Sompel by which browsers can access preserved versions of websites. With funding from the Mellon Foundation, the LOCKSS team is currently implementing Memento so that LOCKSS boxes will conform to this standard to access past content.

Three audit and verification tools detail what content is in a library's LOCKSS box and the content's preservation status.

- On demand, a LOCKSS box produces a KBART (Knowledge Bases And Related Tools) report of the locally preserved content.
- A LOCKSS box displays detailed preservation status for each Archival Unit. (An Archival Unit is typically a volume of a journal, or a complete book).
- A LOCKSS box administrator can use a properly configured web browser from an authorized IP address to view preserved content through an "audit proxy". The viewer sees the content as it was collected by the LOCKSS system.

Librarians administer their institution's LOCKSS boxes through a web browser that allows them to easily select new content for preservation, monitor content's preservation status and a variety of other functions (Stanford 2012c).

Post cancellation access to all preserved content is ensured as the content is under the library's local custody.

8. Migrating Obsolete Formats

LOCKSS preserves all web published formats (animations, datasets, moving images, still images, software, sound, text) and genres (journals, books, blogs, websites, scanned files, audio, video). The LOCKSS software is format-agnostic and preserves all content in its original format, as delivered from the publisher, including the format metadata that enables a browser to render the content.

The field of digital preservation has lavished much attention on the risk of format obsolescence (Rosenthal 2009). For web content, a format becomes obsolete when commonly available browsers and plug-ins can no longer render it. There is little evidence that this is happening to the widely used web formats in which the books and journals of the GLN or the special collections in PLNs are published.

Nevertheless, more than seven years ago the LOCKSS technology demonstrated its ability to handle format obsolescence if and when it occurs (Rosenthal et al. 2005). When a browser requests content from a LOCKSS box, it uses the part of the HTTP standard called "content negotiation" to specify the formats it can render. If the requesting browser cannot render the format of the preserved content, the LOCKSS box invokes appropriate format migrators to create a temporary copy in a format the browser can render (Ockerbloom 1998). After use, the LOCKSS box discards the temporary access copy.

(The LOCKSS team demonstrated this process by modifying a browser to claim that it could not render the GIF format, whereupon the LOCKSS box created temporary copies of the GIF images in a histology paper in PNG format. An unmodified browser saw the same images as GIFs).

The LOCKSS Program's "migration on access" approach has significant advantages over "format normalization" as it preserves the original artefact, uses much less overhead, saves money and takes advantage of the most up to date technology. Preserving the content in its original format satisfies

archival requirements. It allows the LOCKSS system to be frugal with storage space. We know of no preservation system that discards the original bits after migrating them to a new format. Migrating and keeping both the original and the migrated copy multiplies the storage requirements for a preservation system by the number of migrations.

Preserved content is migrated by the most recent, and presumably best, technology available at the time the reader requests access. Preserved content is rarely accessed. Performing migration only when and if it is needed reduces the resource cost. Content can be migrated directly from the original to the current format, minimizing the effects of format conversion artefacts. The format converters, once developed, can themselves be preserved to document the original format.

9. Taking Action

Paper library systems, through implicit library collaboration and cooperation are robust and effective at preserving cultural memory. Libraries have an opportunity and a responsibility to acquire these characteristics in the digital environment.

The Stanford University LOCKSS Program provides libraries with the means to cooperate socially, technically and financially to build and preserve authoritative copies of subscription, open access and special digital collections. The open source distributed digital preservation approach builds tamper evident infrastructure. The time-tested robust and resilient paper world implementation of “lots of copies keep stuff safe” is easily implemented in the digital environment. Local infrastructure and collections ensure continual access and the more content is replicated, the greater its chances of surviving for the long-term. Collaborative, collective action at a local level yields highly leveraged results globally.

National Library of New Zealand, Digital Preservation and the Role of UNESCO

Steve Knight

Programme Director Preservation Research and Consultancy, National Library of New Zealand

Abstract

In 2003, UNESCO published its Guidelines for the Preservation of Digital Heritage and adopted its Charter on the Preservation of Digital Heritage. Also in 2003, The National Library of New Zealand Act was passed providing the mandate for the Library to begin collecting and preserving New Zealand's digital heritage in ways that will ensure current and future access. This paper will show that the 2003 UNESCO documents are still valid today, look briefly at the current state of digital preservation and outline some possible approaches for UNESCO to refresh its 2003 statements on digital preservation.

Author

Steve Knight is the Programme Director, Preservation Research and Consultancy at the National Library of New Zealand (NLNZ). From a library background Steve has experience in a range of information management disciplines, including records management and document management and the design and implementation of electronic services. Among other initiatives Steve was involved in setting up the National Digital Forum in New Zealand, the award-winning Matapihi collaboration and the National Digital Heritage Archive, NLNZ's digital preservation programme. Steve has represented the National Library of New Zealand on the National Digital Forum Board, is a member of the Advisory Committee for the School of Information Management at Victoria University in Wellington, is on the Steering Committee for the International Internet Preservation Consortium and has represented the National Library in various European Commission activities related to the Commission's work on digital libraries and digital preservation.

UNESCO Charter on the Preservation of Digital Heritage 2003.	National Library of New Zealand (Te Puna Mātauranga o Aotearoa) Act 2003
<p>The General Conference</p> <p>Considering that the disappearance of heritage in whatever form constitutes an impoverishment of the heritage of all nations,</p> <p>Recognising that such resources of information and creative expression are increasingly produced, distributed, accessed and maintained in digital form, creating a new legacy—the digital heritage,</p> <p>Understanding that this digital heritage is at risk of being lost and that its preservation for the benefit of present and future generations is an urgent issue of worldwide concern,</p> <p>Proclaims the following principles and adopts the present Charter.</p>	<p>The purpose of the National Library is to enrich the cultural and economic life of New Zealand and its interchanges with other nations by, as appropriate, collecting, preserving, and protecting documents, particularly those relating to New Zealand, and making them accessible for all the people of New Zealand, in a manner consistent with their status as documentary heritage and taonga;</p> <p>For the purposes of carrying out his or her duties, the National Librarian and any employee, contractor, or agent of the chief executive may possess, copy, store in electronic form (whether offline or online), and use any copy of a deposited document.</p>

1. Introduction

At an almost identical point in time UNESCO and the National Library of New Zealand (NLNZ) formally recognise the importance of digital preservation to the safety and protection of the world's digital heritage, UNESCO through the Charter on the Preservation of Digital Heritage¹ and NLNZ through the revision of its legislation which provided the mandate for the Library to collect in the digital realm and which catalysed the Library's digital preservation programme.²

Earlier in 2003, UNESCO had released its Guidelines for the Preservation of Digital Heritage prepared by Colin Webb, then Director of Preservation at the National Library of Australia.³ In 2004 the Library launches its National Digital Heritage Archive (NDHA) project, the foundation for its digital preservation programme. The project is funded by government to the tune of NZ\$24 million and has a four year timeframe.

In this paper, I will undertake to do three things:

1. Show the current validity of the 2003 UNESCO documents with specific reference to the statements on Responsibility and Principles
2. Briefly comment on the current digital preservation environment
3. Outline some possible approaches for UNESCO to refresh its commitment to the digital preservation domain and take a leading role in the long-term preservation of the digital heritage of all nations.

The point here is not to show convergence between UNESCO conceptualising as expressed in the Charter and Guidelines and evolving practice at the NLNZ. The point is to show how robust and comprehensive this early work from UNESCO was and how beneficial that work still is to NLNZ, as a representative organisation implementing a digital preservation programme.

2. Responsibility for digital preservation

In its discussion of responsibility the UNESCO Guidelines pose four questions to help determine an organisation's for accepting a digital preservation responsibility:

1. Does the business of the organisation imply an existing or potential preservation obligation for any kinds of digital heritage materials? (Is the organisation required to take responsibility?)
2. Does the organisation have an interest in accepting a preservation responsibility? (Does it want to have a role?)
3. Does the organisation have, or could it acquire, the capacity to take on a preservation responsibility?
4. Is this really someone else's responsibility?

¹ UNESCO, "Charter on the Preservation of Digital Heritage," 2003, accessed August 13, 2012, http://portal.unesco.org/en/ev.php-URL_ID=17721&URL_DO=DO_TOPIC&URL_SECTION=201.html.

² National Library of New Zealand, *National Library of New Zealand (Te Puna Mātauranga o Aotearoa) Act 2003*, accessed August 13, 2012, <http://www.legislation.govt.nz/act/public/2003/0019/latest/DLM191962.html>.

³ UNESCO, "Guidelines for the Preservation of Digital Heritage," 2003, accessed August 13, 2012, <http://unesdoc.unesco.org/images/0013/001300/130071e.pdf>.

For the National Library of New Zealand the answers to these questions are unequivocally yes, yes, yes and no. There is a natural fit between a national library and the need to ensure the long-term preservation of a nation's digital heritage.

The Guidelines also propose some possible continuums for levels of responsibility an organisation might agree to undertake.

<i>1. Scope of material</i>	Restricted Programme			Selective Programme	Broad Programme
	very restricted				wide range, comprehensively collected
<i>2. Scope of time</i>	Initial Programme	Caretaker Programme			Long-term Programme
	only until technology changes	only until use ceases	for a limited number of years		"forever"
<i>3. Scope of functions and responsibilities</i>	Partial, non-comprehensive Programme				Comprehensive Programme
	restricted functions				comprehensive functions
<i>4. Level of reliability</i>	Non-reliable Programme				Fully reliable Programme
	limited characteristics of reliability				all characteristics of reliability

Using these proposed continuums of responsibility the Library's responsibilities for the digital heritage of the nation requires a broad programme, a long-term programme, a comprehensive programme and a fully reliable programme.

The National Library of New Zealand cannot avoid digital preservation.

3. Principles of digital preservation

The following table reflects the NLNZ approach to the principles of digital preservation articulated in the UNESCO Guidelines.

Twenty-two of the forty-one principles are reflected upon here. The reason a subset of the principles has been chosen is that one principle is often refined further by another principle, e.g.,

maintaining accessibility. The purpose of this exercise is to show the overall alignment of the UNESCO Principles and the NLNZ digital preservation programme as it developed over time.

Number	UNESCO Guidelines principle	NLNZ approach
1	Not all digital materials need to be kept, only those that are judged to have ongoing value: these form the digital heritage.	The goal of the NDHA programme is to ‘enable the National Library of New Zealand ... to collect, make accessible, and preserve in perpetuity, New Zealand’s digital heritage, as defined by the Library’s current collection policy’, a clear recognition that similar decisions need to be made when building digital collections as with analogue collections.
3	Digital materials cannot be said to be preserved if access is lost.	As above the goal of the NDHA programme was to ‘to collect, make accessible, and preserve in perpetuity’.
5	Digital preservation will only happen if organisations and individuals accept responsibility for it.	A national library is a natural fit for digital preservation. The National Library Act 2003 gave NLNZ the mandate to collect digital and the impetus to develop its digital preservation programme. The core issue here is to be able to transfer our trustworthiness from the analogue world to the digital world.
8	It is important to do no harm.	The library identified nine architectural qualities as being of particular significance to the NDHA. The highest ranked of these is Data Assurance expressed as ‘zero data loss.’ The complexity between the statement and the practical import of the statement is the challenge.
9	Acceptance of responsibility should be explicitly and responsibly declared, taking account of the likely implications for other preservation programmes and for other stakeholders.	Acceptance of responsibility is an explicit outcome of the National Library Act 2003. We are currently working with Archives New Zealand to leverage the NDHA to support the preservation of the digital public record in line with the Public Records Act 2005. We are also working with external organisations with regard to third party hosting and the potential for a whole-of-country approach to digital preservation.
14	Working with producers to influence the standards and practices they use, and to increase their awareness of preservation needs, are important investments.	The Library is very aware that there is a continuum of activities that influence the nature and extent of the digital preservation programme’s ability to undertake its role. We are beginning discussions with major publishers to ensure that they are integral partners in the broadening of the Library’s digital preservation programme.
16	Digital heritage materials must be moved to a safe place where they can be	The Library has its own dedicated data centre with discrete provision for the digital preservation programme. This is currently being enhanced with movement of the NDHA to a

	controlled, protected and managed for preservation.	state-of-the-art data centre located outside of the Library and built to withstand one-in-a-hundred-year events. This is necessary in a geologically active region.
17	Digital heritage materials must be uniquely identified, and described using appropriate metadata for resource discovery, management and preservation.	All objects in the NDHA receive a unique and persistent identifier (using the Handle System). ⁴ As well as being uniquely identified in this manner each item is discretely described in the Library resource discovery and collection management systems and data is automatically synchronised between the collection management and digital preservation systems.
19	Preservation programmes should use standardised metadata schemas as they become available, for interoperability between programmes.	The Library's resource discovery and collection management systems are based on MARC and ISAD-G metadata. Synchronisation between collection management and digital preservation systems is via Dublin Core. In 2003 the Library presented a revised version of its earlier work on preservation metadata ⁵ including an associated XML schema. ⁶ With the development of the Library's digital preservation system Rosetta, by Ex Libris Group, the underlying data model has been created in accordance with the de facto standard PREMIS. ⁷
20	The links between digital objects and their metadata must be securely maintained, and the metadata must be preserved.	The NDHA programme was developed within the framework provided by NASA's Open Archival Information System (OAIS) reference model. ⁸ The Library has core enterprise systems for resource discovery and collection management. These have now been joined by Rosetta, a purpose built digital preservation system. Together these provide the links between objects and their metadata required to ensure the long-term viability of the objects over time.
21	Authenticity is a critical issue where digital objects are used as evidence.	All objects ingested into the NDHA permanent repository receive a combined hash key of MD5, CRC32, and SHA1 for use in the detection of change in their files. Regular, ongoing crawling of the permanent repository is undertaken in order to

		detect change in the files stored there.
22	Data that underlies digital objects must be safely stored and managed if there is to be any chance of re-presenting authentic objects to users.	Issues regarding the preservation of databases and research data are still to be formally addressed by the NDHA. This is seen as a major gap in our current capability.
24	Authenticity is best protected by measures that ensure the integrity of the data is not compromised, and by documentation that maintains the clear identity of the material.	Our digital preservation system Rosetta currently contains data about 276 separate events that occur in the system. Of these fifty are considered provenance events and are retained with their relevant objects for the long-term.
25	Data protection is built on the principles of system security and redundancy.	The NDHA defines nine core architectural qualities: Data Assurance, Security, Portability, Flexibility, Manageability and Maintainability, Scalability, Performance, Availability, Disaster Recovery. We have not yet tested how well we have met our goals in terms of achieving these qualities.
28	Preservation action should not be delayed until a single 'digital preservation standard' appears.	<p>Migration and emulation are not yet well proven in the digital preservation domain, in particular the quality assurance processes for determining success of any particular transformation.</p> <p>Understanding of formats, tools for characterising, validating and extracting metadata from formats are all less satisfactory than we would like.</p> <p>However, these are not reasons for not moving towards a functioning digital preservation programme. The NDHA has material flagged as format 'unknown'. We expect to come back to this material when resources, tools, capability, etc., allow. In the meantime it is in a managed digital preservation environment.</p>
30	It is reasonable for programmes to choose multiple strategies for preserving access, especially to diverse collections. They should consider the potential benefits of maintaining the original data streams of materials as well as any	<p>The NDHA maintains bit streams, Preservation Masters, Modified Masters (e.g., sound recordings with noise removed) and access derivatives appropriate for the individual object.</p> <p>The hope is that we should be able to move seamlessly between levels of objects over time as new tools and technologies arise that enable better preservation and access processes for those objects.</p>

	modified versions, as an insurance against the failure of still uncertain strategies.	
32	Preservation programmes are often required to judge acceptable and unacceptable levels of loss, in terms of items, elements, and user needs.	Zero data loss is the goal. However, that may not be possible for all material at all times, if at all. Pre-conditioning (making objects preservation ready), preservation planning and action may require acceptance of loss. Within the NLNZ programme this is a curatorial decision based on the best advice possible from the digital preservation programme at the time.
37	The costs of preservation programmes are hard to estimate because they encompass so much uncertainty.	Issues regarding the costs of digital preservation at NLNZ are still to be formally addressed. The move to Infrastructure as a Service (IaaS) in the next 12 months will provide more certainty about the costs of storage in the first instance.
38	Preservation programmes may start as pilot projects but they eventually need to establish sustainable business models.	Issues relating to the business model for digital preservation have not yet been addressed by NLNZ. As we move to IaaS, 3 rd party hosting and the potential for a whole of country approach to digital preservation this will become increasing important.
39	While suitable service providers may be found to carry out some functions, ultimately responsibility for achieving preservation objectives rests with preservation programmes, and with those who oversee and resource them.	It is noteworthy that commercial service providers are conspicuous by their absence and where services are starting to appear they are in the 'softer' areas of the preservation domain, e.g., in the area of audit and certification, but not in the development of commercial emulation services. Is it that there is not a sustainable market for such services? If that is the case how does the community respond to this?
40	Working collaboratively is often a cost effective way to build preservation programmes with wide coverage, mutual support and the required expertise.	Rosetta is one of only two commercially available digital preservation systems in the world. NLNZ decided early on to work with commercial partners (Ex Libris and Sun Microsystems). We did not have the skills in-house to build a solution. We did not want to build a bespoke solution for the National Library of New Zealand. We believe our activities should be applicable as broadly as possible across the whole digital preservation community. Consequently, development of a broad-based user community, a formal programme of community agreed enhancements and a development roadmap among other things convinced us that the commercial route was more likely to provide the continuity that we needed.
41	Collaboration involves	As part of the NDHA project we instituted an international

	costs and choices as well as potential benefits.	Peer Review Group to provide a check on the Library's thinking about digital preservation and also to act as an objective advisor to the Library's vendor as to whether what we were asking for did actually represent current best practice thinking about what a digital preservation system should do. We also instituted a Cross Government Working Group from 27 government departments to help catalyse awareness of digital preservation and also to tap into specialist expertise from the wider public sector.
--	--	---

From this brief discussion of the responsibilities and principles delineated by the UNESCO Guidelines and how they have been responded to (albeit unwittingly) by the National Library of New Zealand, we can see the quality of the Guidelines approach and its robustness. It is worth considering in particular the foresight required to articulate some very difficult practical issues, e.g., Principles 8, 22, 25 and 28.

4. Digital Preservation

In 2007, the amount of digital information created surpassed, for the first time, the amount of storage needed to deal with it. Of course, we don't need to store all the bits created like digital TV signals or phone-call routing information. But if we wanted to, we couldn't.⁹

About the only growth rate that hasn't gone negative since the beginning of the recession in 2008 is the creation of new digital information. People are still taking pictures, making phone calls, sending emails, blogging, and putting up videos on YouTube. Enterprises are still capturing daily transaction records and adding to their data warehouses. Governments are still requiring more information be kept and protected, forcing the migration to digital TV and taking surveillance photos of their citizens.

But what is the current state of our ability to collect this digital deluge and preserve it for the long-term?

A quick perusal of the digital preservation world today shows over fifty initiatives working on digital preservation systems, repositories, projects and advisory programmes and the provision of standards, products, tools and services (and this from a decidedly narrow, monolingual/English perspective).

When we look at how we talk about digital preservation (repositories, data archiving, digital archiving, life cycle, digital curation, data curation digital preservation) and when we look at the social and cultural issues related to digital preservation (standards, audit/certification, technical, organisational, legal, economic, education) are we presented with a clear, coherent framework for the long-term preservation of nations' digital heritage?

It could be argued that there is currently a genuine lack of a clear, shared understanding of what digital preservation is, what it should be doing, what questions it should be answering for the future and

⁹ John F. Gantz, Christopher Chute, Alex Manfrediz, Stephen Minton, David Reinsel, Wolfgang Schlichting, and Anna Toncheva, "The diverse and exploding digital universe: An updated forecast of worldwide information growth through 2011," March 2008, An IDC White Paper, sponsored by EMC, accessed August 24, 2012, <http://www.emc.com/collateral/analyst-reports/diverse-exploding-digital-universe.pdf>.

what sort of information/data we should be providing today to allow those questions to be accurately answered in the future.

This needs to be addressed, as it is digital preservation that will ensure maximum leverage of the digital long-tail. Governments everywhere are concerned about the cost to the public and the sustainability of government information. Government data, big data, linked data, open government, open access, citizens' rights to information, data re-use all permeate our discussions about digital information. Digital preservation needs to be at the centre of this discourse.

Concurrent with this however, as noted recently in *Wired Magazine*, open data is not just about empowering the empowered and open data is not an end in itself. 'Massive data dumps and even friendly online government portals are insufficient,' ... 'ordinary people need to know what information is available and they need the training to be conversant in it' ... 'and if people are to have more than theoretical access to the information, it needs to be easy and cheap to use.' 'That means investing in the kinds of organizations doing outreach, advocacy, and education in the communities least familiar with the benefits of data transparency. If we want truly open government, we still have to do the hard work of addressing basic and stubborn inequalities. However freely it flows, the data alone isn't enough.'¹⁰

In her keynote at the Aligning National Approaches to Digital Preservation conference in Tallinn last year Laura Campbell broached the possibility of 'an international preservation body with a focus on policy, perhaps assisted by an advisory expert group to identify what categories of digital objects are most at risk. The body could promote an international notion of collection, work on standards and tools, and maybe maintain a common index of preserved materials.' The results of that conference have recently been published with six key strategies for alignment described—legal, organizational, standards, technical, economic and education.¹¹

Maybe here lies the solution to the current fractured state of the digital preservation domain mentioned above, and maybe also a role for UNESCO.

5. Facets of the web

While the current explosion of digital materials as the result of global digitization programmes creates the need for a supporting digital preservation infrastructure this is not where the primary risk for digital resides. The real risk is embodied in digitally born materials, those that have no analogue equivalent. And this risk is most clearly manifested by the Internet and whatever successors may emerge over time.

This is reflected in the Guidelines which note that 'this digital heritage is likely to become more important and more widespread over time' and 'new forms of expression and communication have emerged that did not exist previously. The Internet is one vast example of this phenomenon.'

I want now to note a few attributes of the web that together comprise a unique challenge to the digital preservation programme and which broaden the conversation regarding the impact of digital both globally and across all of our lives.

These attributes include:

¹⁰ Jesse Lichtenstein, "Why open data alone is not enough," *Wired Magazine* (July 2011), accessed August 24, 2012, http://www.wired.com/magazine/2011/06/st_essay_datafireworks/.

¹¹ Nancy Y. McGovern, ed., *Aligning national approaches to digital preservation* (Atlanta, GA: Educopia Institute Publications, 2012), accessed August 24 2012, http://www.educopia.org/sites/default/files/ANADP_Educopia_2012.pdf.

The potential to leave us with more and richer histories of moments in time - social history, minorities, ethnic communities - the nature and extent of heritage and history have the potential to be opened out.

The historian Henry Steel Commager stated about newspapers that “this is what really happened, reported by a free press to a free people. It is the raw material of history; it is the story of our own times.”¹² Increasingly this will be the role of the Internet.

The range of people engaging in digital culture far outstrips the range of people engaging in print culture. The nature of those participating in digital culture is substantially more diverse. More histories will be made available to us over time. These histories would not have left a trace in print culture.

The Guidelines note that ‘using computers and related tools, humans are creating and sharing digital resources - information, creative expression, ideas and knowledge ... that they value and want to share with others over time as well as across space.’ They also note that ‘increasingly this is a heritage that documents the actions of governments, the results of scientific research, the debate of ideas, the aspirations and imagination of communities, the histories of the current and coming world.’ Almost everyone, everywhere is online in one form or another, or will be.

Social media is about direct, instantaneous communication and can result in the creation of social movements which may never have been recorded in the past. Our digital collecting and our preservation programme need to reflect this.

Where recommendations used to be from semi-elitist sources – the food critic, the movie critic – the range of ‘experts’ that we rely on for input across the universe of our choices has increased dramatically. What are the implications for citizenship and an active democratic process? Do we face a democratisation of recommendation / information or are we heading towards a Tower of Babel? Will we become more engaged or will we become more passive?

The Guidelines note that ‘definitions of heritage need to be seen in context’, that ‘heritage value may also be based on what is important at a group or community level’, that ‘heritage materials can exist well beyond the limits suggested by national legislation or international conventions’ and, finally, that ‘anything that is considered important enough to be passed to the future can be considered to have heritage value of some kind.’

6. A Role for UNESCO?

In the above I have tried to show that the UNESCO Charter and Guidelines were exemplary documents of their time using the sections on Responsibilities and principles as a litmus. They traversed the core issues relating to the long-term safety of national digital heritage and provided a conceptual framework which is still valid today. I have also suggested, in the section on digital preservation that the promise of these

¹² New York Times, *One hundred years of famous pages from the New York Times, 1851-1951* (New York, NY: Simon and Schuster, 1951).

documents has not yet been met and that digital preservation practice still falls far short of the objectives that the authors of the Charter and Guidelines had envisaged.

In the following sections I want to show that UNESCO not only has a role to play in the digital preservation domain but that it has a unique role related to its global reach and objectives.

The potential to collect, preserve and make accessible a fuller expression of the cultures, heritages, histories of peoples is within our grasp. This is not to say that traditional activities related to selection and appraisal and the related assigning of value will not continue. However, it is to say that the opportunity exists in the digital sphere and within the parameters of a robust, scalable digital preservation programme to ensure that substantially more of the multiple histories of the world can be kept for the benefit of the future.

In an article for the *St Louis Post-Dispatch* Bill McClellan describes the agonising choice as to whether to keep a colleague and friend's letters and papers after he died and the serendipitous path that lead him to pass the papers on to the St. Louis Media Archives.¹³ This is not a particularly unusual occurrence in itself but how will this story be played out in the ubiquitous world of the internet? How will that ubiquity shape what history, what culture, what heritage of peoples' is still available and accessible to the future?

Why should UNESCO be a part of the global digital preservation programme? It is not an accident that national libraries, archives, museums are called memory institutions and the history of deliberate destruction of libraries is as long as the history of print culture itself.

- Destruction of the Library of Alexandria – date uncertain
- Destruction of scientific and philosophical library in Cordoba – 10th century
- Destruction of the Corvina Library in Buda – 1526
- Destruction of the Fatimid Library in Cairo – 1806
- Destruction of the libraries and archives of the Maya – Spanish Colonialists
- Destruction of the libraries and archives of the Aztecs – Spanish colonialists
- Destruction of the National and University Library of Bosnia and Herzegovina – 1992
- Destruction of the Abkhazian Research Institute of History, Language and Literature – 1992
- Mayor of Orange, France removing material deemed to be not truly French in support of far right National Front party – 1996
- Patriot Act, United States requires libraries to hand over details of their users – 2001
- Burning Harry Potter in New Mexico – 2001
- Destruction of National Library of Iraq including books that survived the sacking by the Mongols in 1258 when the waters of the Tigris were said to have run black with ink – 2003
- Court ordered burning of books in Cuba - 2005
- Dove World Outreach Centre, Florida – 2010, in the end refrains from burning the Koran.

What is the impulse behind these acts? What is it that is feared? If it is not the memory held within these institutions? This is why digital preservation matters and this is why UNESCO needs to be at the forefront of moves towards a global approach to digital preservation.

¹³ B. McClellan, "McClellan: Friend's letters now part of history," *St. Louis Post-Dispatch*, July 30 2012, accessed August 26, 2012, http://www.stltoday.com/news/local/columns/bill-mcclellan/mcclellan-friend-s-letters-now-part-of-history/article_b9c8158a-523c-575c-bc8a-67dcb95d131d.html.

7. A Goal for UNESCO?

Parts of a solution should include:

- We need to be more purposive about weaving digital preservation into the wider strategic approach to our digital activities;
- We need to engage more methodically with the increasing quantity and complexity of digital materials going forwards;
- We need secure, stable, agreed relationships with large institutional creators (e.g., newspaper publishers), academic and private research producers etc.;
- We need to move from short term project funding to ongoing sustainable funding recognising the ongoing-ness of digital preservation;
- We need to engage with the full spectrum of national and international stakeholders to make this work;
- We need to make explicit the long-tail implications of digital preservation.

From a UNESCO point of view the following quote from Marcus Garvey is characteristic of why digital preservation is important:

A people without the knowledge of their past ... is like a tree without roots.

From a national library point of view the following quote is characteristic of why digital preservation is important:

A National Library is a place where a nation nourishes its memory and exerts its imagination – where it connects with its past and invents its future.¹⁴

But even national libraries are not immune to the chill effects of government priorities, hostile economic requirements, and a lack of understanding that a nation's self-worth, identity, etc., are supported by national libraries.¹⁵ While this is one person's view of a very heated current debate it is a salutary reminder that offices of culture such as national libraries and national archives do not necessarily have a privileged position to protect them from the prevailing winds. The Guidelines state that 'making sure this burgeoning digital heritage remains available is thus a global issue relevant to all countries and communities.' In looking to refresh the excellent work of the 2003 documents, a larger goal for UNESCO could be: ***to see the vision of the Charter embedded in the national legislations of its member states.***

In this way UNESCO would be fulfilling its objectives for digital preservation as stated in Article 12 of the Charter and also reinforcing Article 19 of the Universal Declaration of Human Rights which states that 'everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.'¹⁶

The Economics of Preserving Digital Information

The Economics of Long-Term Digital Storage

David S. H. Rosenthal,¹ Daniel C. Rosenthal,² Ethan L. Miller,² Ian F. Adams,² Mark W. Storer³ and Erez Zadok⁴

¹Stanford University Libraries, USA, ²UC Santa Cruz, USA, ³NetApp, ⁴Stony Brook University, USA

Abstract

The cost per byte of storage media has dropped exponentially for three decades. Despite this, a Blue Ribbon panel described economic sustainability as the major issue facing long-term digital preservation. If economics are the major concern even when prices drop rapidly, what will happen if they slow or stop? We present evidence that they will, and some simulations of the impact on digital preservation costs.

Author

David Rosenthal is the Chief Scientist of the LOCKSS Program at the Stanford Library. Ethan Miller is Associate Director, and Daniel Rosenthal and Ian Adams are graduate students at U.C. Santa Cruz 's Storage Systems Research Center. Mark Storer is a Member of Technical Staff in the Advanced Technology Group at NetApp. Erez Zadok is Director of Stony Brook University's Filesystems and Storage Lab.

1. Introduction

Paper as the medium for the world's memory has one great advantage; it survives benign neglect well. Bits, on the other hand, need continual care, and thus a continual flow of money. A Blue Ribbon panel described economic sustainability as the major issue facing long-term digital preservation.¹ This is despite Kryder's Law, the 30-year history of the cost of digital storage media dropping exponentially. If economics are the major concern even when Kryder's Law holds, what will happen if it slows or stops?

We present the growing body of evidence suggesting that Kryder's Law will not be as helpful in the future as it has been in the past. The dimming prospect for Kryder's Law is a major motivation for research under way with participants from UC Santa Cruz's Storage Systems Research Center, Stony Brook University's Filesystems and Storage Lab, the LOCKSS² Program at the Stanford Libraries and NetApp. The goal is to develop a comprehensive economic model of long-term digital storage capable of being used for scenario planning by a wide range of digital archives, and which can be used as a component of broader models of digital preservation costs. Results from prototypes of this model illuminate issues important for preservation such as the impact of the recent disk price spike, and the cost-effectiveness of cloud storage.

2. Economics of Digital Preservation

There is a substantial body of work on the cost of digital preservation. Some does not, or not yet, cover storage costs:

¹ Blue Ribbon Task Force on Sustainable Digital Preservation and Access, 2010.

² Lots Of Copies Keep Stuff Safe, a trademark of Stanford University.

- CMDP³ is an effort under way, funded by the Danish Ministry of Culture, to build a cost model for each of the activities identified in the OAIS reference model.⁴ Initial work focuses on the early activities, preservation planning and ingest; CMDP has yet to deal with long-term storage costs.
- The Blue Ribbon Task Force on Sustainable Digital Preservation and Access was funded by the NSF, the Andrew W. Mellon Foundation, the Library of Congress, the U.K. Joint Information Systems Committee (JISC), the National Archives and Records Administration, and the Council on Library and Information Resources. Their final report does not treat storage costs.⁵

Others include storage costs:

- LIFE is funded by the UK's JISC to build a life-cycle model of e-literature in a series of phases.⁶ Storage costs were first treated retrospectively in Phase 2⁷ and at a more detailed prospective level in Phase 3.⁸
- KRDS⁹ is also funded by JISC. It is primarily focused on identifying the value of digital collections, but in its initial phase¹⁰ it developed a cost model including storage costs.
- The PrestoPrime project funded by the EU developed an interactive simulation of preservation costs including storage costs.¹¹
- ENSURE is an EU-funded project in its early stages of building a preservation cost model "Based on cost data collection" that "aims to tackle the challenges that face cost modelling for long-term digital preservation."¹²
- Stephen Chapman¹³ compared historic storage costs for analogue items in the Harvard Depository with those for digital objects at OCLC.
- The California Digital Library has developed a Total Cost of Preservation model that includes storage costs.¹⁴

Storage costs are only one element of the total cost of digital preservation. These studies confirm that a significant part of the total, half in some studies, has to be paid up-front as content is ingested. But storage is important in each of these models as it is a large part of the continuing cost. The models these studies use to project future storage costs are based on collecting historical cost data and using it to project future costs. They implicitly assume that Kryder's Law continues in the future as it has in the past. If this assumption were not to hold it would have two significant effects:

³ Kejser, Nielsen and Thirifays, 2011.

⁴ ISO 14721:2003.

⁵ Blue Ribbon Task Force on Sustainable Digital Preservation and Access, 2010.

⁶ Wheatley, Ayris, Davies, McLeod and Shenton 2007.

⁷ Ayris, Davies, McLeod, Miao, Shenton and Wheatley 2008.

⁸ Wheatley and Hole 2009.

⁹ Beagrie 2012.

¹⁰ Beagrie 2008.

¹¹ Addis and Jacyno 2010.

¹² Xue, Shehab, Baguley and Badawy 2011.

¹³ Chapman 2006.

¹⁴ Abrams, Cruse, Kunze and Mandrane 2012.

- The proportion of overall of digital preservation costs represented by storage costs would greatly increase, since the cost of storing any individual object would no longer rapidly become insignificant.
- The projected total future cost of digital preservation would rise significantly.

If Kryder's law will not continue the current cost forecasting techniques will produce misleadingly optimistic projections, leading to increased risk of economic failure. We need a new approach to modeling the storage cost component of the overall cost of digital preservation.

Strictly, Kryder's Law is not about cost. It states that the areal density of bits on disk platters roughly doubles every two years.¹⁵ The cost implication of this was popularized by Clayton Christensen's 1997 book *The Innovator's Dilemma*¹⁶ but it has actually held for about three decades. Until very recently, the disk drive business was highly competitive, with no manufacturer having a dominant market share, so increases in areal density resulted in corresponding decreases in cost per bit. In practice, consumers got double the capacity at approximately the same price every two years.

3. Storage Technology Futures

Unfortunately, there is a growing body of evidence suggesting that future improvements in storage cost per bit will be much slower than in the past. This applies to disk, tape and the various forms of solid state storage. IDC's projections for the storage industry as a whole¹⁷ show slowing in both the rate of decrease in cost per bit and in the rate of investment in digital storage through 2015.

3.1 Disk

In 2011 disk represented 70% of all the bytes of storage shipped.¹⁸ The disk industry's roadmap used to predict a consistent 40%/yr improvement in bit density on disk platters, which translated to a 40%/yr reduction in cost per bit stored.¹⁹ In recent years the industry has failed to achieve this roadmap target.²⁰ The current roadmap predicts no more than a 20%/yr improvement in bit density for the next five years.²¹ There are reasons to believe that even this may be optimistic, and also that even if it were to be achieved it might not translate directly into a 20%/yr drop in cost per bit:

- The disk drive industry used to be a commodity business marked by intense competition and low margins. Eventually, the weaker players became vulnerable and in 2012 a spate of mergers transformed the industry.²² Western Digital and Seagate now have more than 85% of the market,²³ so there is much less competition. The market is expected to support considerably

higher margins in the future. An increase in margins represents an effective reduction in the future rate of cost drop.

- The recording technology used by the most recent five generations of disk drives is Perpendicular Magnetic Recording (PMR). According to earlier versions of the industry roadmap, it should have been replaced by Heat Assisted Magnetic Recording (HAMR) by early 2010. HAMR uses a laser to heat the magnetic material on the platter to reduce the size of the area whose magnetism is changed by a write operation. The transition from PMR to HAMR has been delayed because it has turned out to be vastly more difficult and expensive than was predicted. The cost of this transition was a factor driving the consolidation of the industry.
- Unable to deploy HAMR, the industry has resorted to what can only be described as desperate measures to stretch PMR into a sixth generation using a technique called *shingled writes*. This involves writing tracks on the disk so close together that they overlap, and using sophisticated signal processing techniques to disentangle them on a read. This causes system-level problems because disks are no longer randomly writable, they become in effect append-only devices.²⁴ Mitigating these problems by adding capabilities to the disk hardware increases cost and reduces capacity; addressing them by changing operating systems is expensive and disruptive. Shingled write technology may not be a way for disks to stay on the Kryder's Law curve for another technology generation.
- In the past the disk industry has responded to difficulty in increasing bit density and thus in offering higher capacity in the same form factor by adding platters.²⁵ Since adding platters adds cost, and very few more platters can be added without disruptive and expensive changes in the drive form factor, this is less effective than increasing bit density in decreasing cost per bit.
- The favored successor technology to HAMR is Bit-Patterned Media (BPM), which uses lithographic techniques to create an extremely small location for each bit on the platter. The transition from HAMR to BPM is now expected to be even more difficult and expensive than the PMR to HAMR transition. It is therefore likely to encounter similar delays, which act to reduce the rate of cost drop.
- As magnetic particles on the platter get smaller, the temperature below which they can retain information for a given time decreases.²⁶ 'The miniaturization of magnetic recording devices, which store information in nanosized magnetic grains or "bits" is constrained by the so-called superparamagnetic limit: when grains are too small, thermal fluctuations can easily flip the direction of magnetization in each bit, causing permanent loss of information.' For the temperatures and times involved in disk storage, this is expected to limit bit densities to well under 100Tb per square inch.²⁷ At the current roadmap's 20%/yr density increase, this limit could be encountered as soon as 2030; at the 40%/yr used by e.g., Kryder and Kim (2009)²⁸ it would be encountered sometime after 2022. It is to be expected that the rate of increase in bit density will slow as the limit is approached; the current slowing may be early evidence of this.

²⁸ Kryder and Kim, 2009.

- Most disks used for storing long-term data are consumer 3.5" SATA drives, providing large capacity per drive with reasonable performance and good reliability.²⁹ Because they were an essential component of consumer desktop PCs, they have had very large manufacturing volumes and thus very low costs. The consumer PC market has moved to laptops, which use 2.5" drives, and is moving to tablets and ultrabooks, which use flash memory. A total of 415M PCs sold in 2011, of which 66M were tablets (growing at 274%/yr) and about 210M were laptops (growing at 7%) including netbooks and ultrabooks. That leaves 139M desktops (growing at 2%) and servers, which are candidates for 3.5" drives.³⁰ 2.5" disks use the same recording technology as 3.5" disks, and their cost per bit has been decreasing at a similar rate, but they are typically 3-4 years later than 3.5" disks at reaching a particular \$/GB value³¹ and thus, at the historic 40%/yr price drop, 3-5 times as expensive. 3.5" drives consequent loss of manufacturing volume will probably slow the cost drop for long-term data. If long-term data migrates to 2.5" drives it will suffer a significant cost increase. Because both form factors are on parallel Kryder's Law curves, 2.5" drives will never catch up with where 3.5" drives would be if they still existed. By the time this migration occurs, the consumer laptop market for 2.5" drives will probably be in eclipse, reducing their manufacturing volumes too.
- Disk industry insiders³² regard HAMR as much more suitable for 2.5" than for 3.5" drives. If it is initially deployed only on 2.5" drives, this will drive long-term data from 3.5" to 2.5" drives more quickly, making the price increase sharper.
- The 2011 floods in Thailand destroyed about 40% of the world's disk drive manufacturing capacity. Disk drive prices doubled almost overnight, and have yet to return to pre-flood levels,³³ let alone to the levels to which they would have dropped absent the floods. Part of the reason is the enormous cost to the industry of replacing the lost capacity,³⁴ but an additional reason is that the disk manufacturing duopoly has seized the opportunity to increase their margins, which were about 6% for Western Digital and 3% for Seagate pre-flood and are now about 16% and 37%, respectively.³⁵

3.2 Tape

Tape is an important medium for long-stem storage of large amounts of data. At scale, i.e., in large tape robots, its low media costs, low power consumption and relatively high reliability outweigh its long access times. The recording technology used by tape lags about 8 years behind disk, but it is on approximately the same cost per bit curve as disk.

However, tape's share of the total storage market is shrinking, which means it will get less of the total storage R&D investment pool than it used to. Thus we can expect tape's cost per bit to continue dropping, albeit somewhat more slowly than previously, for perhaps another 8 years. This will

²⁹ Pinheiro, Weber and Barroso, 2007; Schroeder and Gibson, 2007.

³⁴ Kunert, July 2012.

³⁵ Hruska, 2012.

significantly increase tape's cost advantage over disk while it happens, although the technological issues of disk recording technology will eventually affect tape too.

3.3 Solid State Memories

Flash memory is currently much more expensive per byte than hard disk but because of its other attributes, low power, small form factor, robustness, it has captured a significant part of the storage market. It may be that these attributes, which are also important for long-term storage,³⁶ will drive flash into that market too. However, there are a large number of alternative solid state technologies on the horizon, some of which are even more promising for long-term storage than flash. Kryder and Kim (2009)³⁷ surveyed the prospects in 2020 for both flash and the alternative solid state technologies, comparing them with their projection for hard disk technology at that date based on a 40% annual increase in bit density. At this rate in 2020 hard disk would still have a factor of 3-10 in bit density to go before reaching the superparamagnetic limit. They conclude:

...to compete with hard drives on a cost per terabyte basis will be challenging for any solid state technology, because the ITRS lithography roadmap limits the density that most alternative technologies can achieve.

Adjusting their projections for a 20% annual increase in hard drive bit density reduces the 2020 target from 10Tb/in² to 1.8Tb/in², or from a 40TB to a 7TB 2.5" drive. This would probably lead to solid state technology capturing more of the storage market, and thus more of the R&D investment, than Kryder and Kim assume, reducing still further hard disk's competitiveness. It would not, however, change their basic conclusion that competing with hard disk on a cost per bit basis would be a challenge. By 2020 all the solid state technologies they surveyed would be approaching technological limits, whereas the lower bit density growth rate implies that then hard disks would still be a factor of 15-50, or 1-2 decades from the superparamagnetic limit.

Thus, although we may expect solid state technology to become more cost-competitive with hard disk in the short term, by the end of this decade this competitiveness will probably decline.

4. Storage Business Models

There are three fundamentally different business models for long-term storage. None of them has the properties a customer would like:

- It can be *rented*. For example, Amazon's Simple Storage Service (S3) charges \$0.125 per GB per month with discounts for large volumes.³⁸ This rent can be decreased or even increased over time, so from the service's point of view the model is not dependent on the Kryder's Law decrease. From the customer's point of view, this model is risky. Unexpected rent increases or even temporary fluctuations in the customer's money supply can lead to permanent loss of data due to inability to pay the monthly rent. Each access to data in S3 costs on the order of a month's

³⁶ Adams, Miller and Rosenthal, 2011.

³⁷ Kryder and Kim, 2009.

³⁸ Amazon, 2012.

storage; customers could be in the awkward position of being able to pay for their data to be stored but being unable to afford to access it.

- The stored content can be *monetized*. For example, Gmail offers a gradually increasing amount of e-mail storage free to users. Google makes money by selling ads when the user accesses their mail. As each message gets older, it is accessed less and less frequently, as is common in archived data. Thus Google makes less and less money from older and older mail, meaning that the Kryder's Law decrease in the cost per bit of storing old mail is important to this business model. But it is not essential. Google can adjust the rate at which it supplies storage to users, reduce their storage allocation, or even start charging users who never click on ads for their e-mail storage, to match their cost of storage and the income from advertisements over time. The customer has no leverage over the service, making it risky for them. The survival of the data is at the whim of the service; if it no longer makes money from the data it will no longer be motivated to preserve it.
- The stored content can be *endowed*, deposited in the storage service together with a sum of money thought to be sufficient to pay for its storage through its entire life. Determining an appropriate sum involves projecting both the Kryder's Law decrease in cost and the future interest rate which will apply to the unexpended part of the endowment. If these projections turn out to be too low the data is at risk, since the service will not be able to afford to keep it.

5. Discounted Cash Flow

For the purpose of building models the endowment approach has a great advantage. It provides an apples-to-apples way to compare the flows of money through time. In effect, it uses the economists' standard technique for doing so, Discounted Cash Flow (DCF). DCF computes the *net present value* of a future expenditure by assuming a constant interest rate, the *discount rate*, and computing the amount less than the future expenditure which, with the addition of the interest accumulated by then, would amount to the future expenditure when it occurs.

Recent research has thrown serious doubt upon both the practical usefulness and theoretical basis of DCF. Its practical usefulness is suspect because it involves choosing a discount rate that will apply for the duration. In practice, people applying DCF choose unrealistically high interest rates, making investment in long-term projects much more difficult to justify than it should be.³⁹ Its theoretical basis is suspect because the single constant interest rate averages out the effect of periods of very high or (as now) very low interest rates. This would be correct if the outcome was linearly related to the interest rate, but it isn't.⁴⁰ This non-linear behavior implies that Monte Carlo models are required to compute the net present value of expenditures.

6. Economic Models of Storage

The difference between the net present value computed by DCF and that computed by models including variable interest rates increases through time, making DCF less and less useful for analysing storage costs the longer the duration of storage.

³⁹ Haldane and Davies, 2011.

⁴⁰ Farmer and Geanakoplos, 2009.

The inadequacy of DCF and the prospect of no longer being able to count on the rapid decrease in cost per bit to make long-term storage costs insignificant motivated our work to develop a Monte Carlo model. The goal is to understand the impact of changes in Kryder's Law and other factors such as interest rates on the cost of storing data.

This work is at an early stage. To explore the problem space, and to communicate with potential users, we have developed some prototype models. The prototypes are producing plausible results, but they have not been validated against real-world data, so their results should not be relied upon. With experience from the prototypes and the feedback we have received from potential users we are developing an integrated, comprehensive model. In the meantime we present results from two of the prototypes.

6.1 Short-Term Model

Our first model follows a unit of hardware, as it might be a shelf of a filer in a data center, facing an exponentially growing demand to store data. Disks are added as needed; their capacities grow over time according to Kryder's Law. They consume power and labor, and are replaced as they fail or end their service life.

Figure 1 shows an example analysis. Parameters are set to plausible values, such as 57% annual growth in demand for data storage⁴¹ and 5% probability of failure in service (estimated from Pinheiro et al.⁴²). The graph shows how total cost of ownership and its components vary with the service life of the disks. It demonstrates the well-known observation that disks (and tapes) are replaced when their density becomes too low to justify the space and power they use, not when their life expires. With our chosen parameters, the model predicts optimum disk replacement in under 3 years.

Note the counter-intuitive increase of the labor component with increasing service life of the disks. Each disk is assumed to consume a fixed amount of labor to install and replace. As service life increases the total number of drives in use increases; the demand for storage remains the same but the average drive becomes smaller and older.

6.2 Long-Term Model

The long-term prototype follows a unit of data through time as it migrates from one storage medium to another, taking up a smaller and smaller proportion of each successive medium. It computes the *endowment* needed to preserve the data using a model of interest rates based on the 20-year history of inflation-protected US Treasury bonds.⁴³

This model includes storage media, with purchase and running costs. They are replaced with successor media when their service life expires, or when new media become available whose costs are enough lower to justify the cost of migrating out of the old medium into the newer one. The endowment earns interest, and pays for the purchase, running and migration costs.

Different models of interest rate variation through time can greatly affect the endowment computation,⁴⁴ so the absolute value of the endowment computed by the long-term prototype should be treated skeptically. Nevertheless, with similar parameters this model produces similar endowment values

⁴¹ Gantz, Manfrediz, Minton, Reinsel, Schlichting and Toncheva, 2011.

⁴² Pinheiro, Weber and Barroso, 2007.

⁴³ US Dept. of Treasury, 2012.

⁴⁴ Farmer and Geanakoplos, 2009.

Figure 1. The effect of hard drive service lifetime on 10-year cost of ownership of an archive growing 57%/yr.

to those of other approaches, e.g., Abrams (2012)⁴⁵ and Addis (2010).⁴⁶ When comparing the effect of other parameters through time, for example different storage technologies or media replacement policies, we use the same interest rate model for each, so their relative cost is unaffected.

6.3 Varying Kryder's Law Rates

Figure 2 shows a simple output of this model, plotting the probability that the data will last 100 years without running out of money (Y axis) against the endowment as a multiple of the initial storage cost for a fixed Kryder's Law rate, in this case 25%/yr. Interest rates are modeled on the past 20 years, and the service life of the media is 4 years. As one would expect, it is an S-curve. If the endowment is too small, running out of money is certain. If it is large enough, survival is certain. The insight from this graph is that the transition from 0% to 100% survival takes place over only about 10% of the critical endowment value. A 25%/yr Kryder's Law rate dominates the effect of the much lower interest rates.

⁴⁵ Abrams, Cruse, Kunze and Mandrane, 2012.

⁴⁶ Addis and Jacyno, 2010.

Figure 2. Survival Probability vs. Endowment as a multiple of initial cost.

Repeating the simulation for a range of Kryder's Law rates gives the surface shown as a heat map in Figure 3. Note that the transition is less abrupt the lower the Kryder rate.

Taking the 98% survival probability contour of this surface gives the graph of Figure 4. One insight from this graph is that historic Kryder's Law rates have been on the flatter, right hand side of the graph, where their effect on the endowment needed is small. The values we expect in the future are on the steep, left hand side of the graph, where the endowment needed is much larger and depends sensitively on the Kryder's Law value. Thus we will be moving from an era when storage was affordable and predicting future storage costs was less important to an era when storage is expensive and predicting future costs is very important.

6.4 Price Spikes

Figure 5 shows an example analysis of the impact of a spike in disk costs such as that caused by the recent floods in Thailand. Interest rates are modeled on the past 20 years, media costs drop exponentially at various rates, and the service life of the media is 4 years. After a variable delay, media costs double for a year then resume their exponential decrease. The graph shows the endowment that provides 95% probability of surviving 100 years without exhausting it, as a multiple of the initial cost. Plausibly, if storage costs drop rapidly spikes have little effect but if they drop slowly the effect is large. Also, if costs drop slowly enough that media are replaced at their service life, and the spike happens at that time, the effect is amplified. We can expect global warming to increase the frequency of supply chain disruptions, and Kryder's Law to flatten, so the impact of future price spikes will be probably be significant.

Figure 3. Survival Probability vs. Endowment vs. Kryder rate.

Figure 4. Endowment vs. Kryder rate.

Figure 5. The impact of spikes in media cost on the endowment required for 95% survival at various Kryder rates. Zero delay has no spike for comparison.

6.5 Solid State Storage

As we see from the short-term model, the raw media cost is only a part of the total cost of storage, even with a relatively short 10-year time horizon. The cost differential between flash and hard disk has been decreasing as flash gains market share. For long-term storage flash has advantages including low power consumption, small form factor, physical robustness and long device lifetime. Suitably exploited,⁴⁷ these factors can outweigh the higher purchase price and deliver lower total cost of ownership over a period.

In principle, at times of low interest rates (such as now) it makes sense to invest in storage technologies with higher capital cost but lower running costs and long lifetimes. At times of high interest rates, it makes sense to invest in technologies with lower capital costs and higher running costs and short lifetimes.

Unfortunately, for an organization to justify investing in solid state storage on this basis requires that it have both a long enough planning horizon and an accounting policy that distinguishes between capital and operating costs. Many organizations lack both; for example most University libraries run on annual budget cycles, are not allowed to carry reserves from year to year, and cannot borrow to finance equipment purchases. Thus, even if solid state storage could offer lower total cost of ownership over say 5 years, they would be unable to invest to capture these savings. This is an example of the problem of short-termism identified by Haldane and Davies (2011).⁴⁸

Our long-term model includes a planning horizon parameter, but we have not yet been able to conduct a detailed study of its effect on investing in solid state storage.

⁴⁷ Adams, Miller and Rosenthal, 2011.

⁴⁸ Haldane and Davies, 2011.

6.6 Cloud Storage

Table 1 shows the history of the prices charged by several major storage services. It shows that they drop at most 3%/yr. This is in stark contrast with the 30-year history of raw disk prices, which have dropped at least 30%/yr.

Table 1. Price History of Some Storage Services

Service	Launch date	Launch \$/GB/mo	2012 \$/GB/mo	Price Drop %/yr
Amazon S3	Mar '06	0.15	0.13	3
Rackspace	May '08	0.15	0.15	0
Azure	Nov '09	0.15	0.14	3
Google	Oct '11	0.13	0.13	0

This comparison is somewhat unfair to S3. Amazon has used the decrease in storage costs to implement a tiered pricing model; over time larger and larger tiers with lower prices have been introduced. The price of the largest tier, now 5PB, has dropped about 10% per year; prices of each tier once introduced have been stable or dropped slowly.

Nevertheless, it is clear that the benefits of the decrease in raw storage prices are not going to cloud storage customers. Backblaze provides unlimited backup for personal computers for a fixed price, currently \$5/mo. Before the floods in Thailand, they documented the build cost of their custom storage hardware at under \$8K for 135TB.⁴⁹ They claimed their 3-year cost of ownership of a Petabyte was under \$100K; even S3's lower-cost Reduced Redundancy Storage (RRS) would have charged \$2.3M over the same period. Adjusting for the current 60% increase in disk prices since the floods⁵⁰ would make the build cost \$11.2K. Given S3's dominance of the cloud storage market, and thus purchasing volumes, it is very unlikely that their costs are much higher than Backblaze's. Despite this, 135TB in S3-RRS costs more than \$10K/mo. In the first month, an S3-RRS customer would pay almost as much as it would currently cost to buy the necessary hardware.

Why is cloud storage so expensive? Actually, in many cases, it isn't. Many customers have data whose life is much less than the life of the hardware, so they cannot amortize a hardware purchase over its life. Many customers, for example startup companies, have a very high cost of capital. Amazon and its competitors price against the value they deliver to these customers; not against their costs.

But Amazon and its competitors should be riding the Kryder's Law curve like everyone else. Why aren't they reducing their prices? Because they don't have to. Suppose you have 135TB in S3-RRS and you decide you are paying too much. You need to move your data somewhere cheaper. You are going to take a month to do it. It will cost you \$10,750, more than a month's storage, in bandwidth charges to get your data out,⁵¹ let alone the staff and other costs of doing the transfer, and checking that it worked

⁴⁹ Nufire, 2011.

⁵⁰ Kunert, May 2012.

⁵¹ Amazon, 2012.

correctly. A competitor is going to have to be a great deal cheaper than S3 to motivate you to pay these transition costs. Since S3 has the vast majority of the market, their costs are probably lower than any competitor's. If a competitor cut prices enough to take significant market share from S3, Amazon would undercut them.

7. Conclusions

From the foregoing, we can draw the following conclusions:

1. Optimistically, for the rest of this decade the rapid decrease in cost per bit of storage that has been a constant of the last three decades will be much slower; it might even stop.
2. This will make the expenditure commitment implied by a decision to preserve some digital content (a) much bigger and (b) much harder to predict than would be expected on the basis of history.
3. In a period of economic stringency, this increases the importance of developing accurate, predictive models of storage and other preservation costs.
4. For much of this decade tape is likely to maintain or improve its existing cost advantage over disk.
5. If organizations can change their accounting methods to properly recognize the long-term cost of ownership of preserved data, current low interest rates provide an opportunity to invest in solid state technologies which, despite their higher capital cost, are for this decade likely to provide lower total cost than disk, while retaining its rapid access.
6. The pricing models of current commercial cloud storage services are not suitable for long-term storage.

²The Danish National Archives, Copenhagen, Denmark, ubk@kb.dk and ubk@kb.dk

Abstract

Information is increasingly being produced in digital form, and some of it must be preserved for the long-term. Digital preservation includes a series of actively managed activities that require on-going funding. To obtain sufficient resources, there is a need for assessing the costs and the benefits accrued by preserving the assets. Cost data is also needed for optimizing activities and comparing the costs of different preservation alternatives. The purpose of this study is to analyse generic requirements for modelling the cost of preserving digital assets. The analysis was based on experiences from a Danish project to develop a cost model. It was found that a generic cost model should account for the nature of the organisation and the assets to be preserved, and for all major preservation activities and cost drivers. In addition, it should describe accounting principles. It was proposed to develop a generic cost model with specific profiles to represent different preservation scenarios.

Authors

Ulla Bøgvad Kejser holds a Ph.D. in Conservation-Restoration Science from the Royal Danish Academy of Fine Arts, School of Conservation. She is a preservation specialist at the Royal Library in Denmark working in the areas of preservation imaging, preservation planning, and curation of both physical and digital collections, especially images. Her current research focuses on modelling the costs of digital preservation.

Anders Bo Nielsen holds a master's in economics from the University of Copenhagen (economic history and IT as specialty) from 1997 and a master in IT (software development as specialty) from the IT University of Copenhagen from 2007. He is a principal consultant at the Department of Appraisal and Transfer at the Danish National Archives, where he has been employed since 1997.

Alex Thirifays is an archivist at The Danish National Archives. He obtained his MA in history in 1999. He has been working as an IT consultant for 6 years, and has, since 2007, been working with digital curation, particularly cost modelling, preservation planning and strategic issues. He developed the Cost Model for Digital Preservation (CMDP) together with Anders Bo Nielsen and Ulla Bøgvad Kejser and published several papers and reports on this work.

1. Introduction

All over the world societies produce more and more information in digital form, either directly from computers and other electronic devices or by digitization of analogue assets. Some of this information is considered worth preserving, e.g., critical business information, personal memories or cultural heritage documents. Preservation and access to digital assets is dependent on technology; the physical streams of bits constituting the information must remain intact and accessible through current systems, and the intellectual content of the information must remain usable over time. Counteracting the constant threat from technological obsolescence requires a series of actively managed activities, including emulation of systems or migration of formats. Facilities with adequate hardware and software must be in place as well as power to keep the systems running. In addition, people with the necessary skills to maintain the

systems and act as curators of the digital assets must be available. The required preservation activities and the flow of information are described at an abstract level in the ISO standard for an Open Archival Information System (OAIS) Reference Model.¹ The OAIS functional model divides the lifecycle in seven main functional entities: Ingest, Archival Storage, Data Management, Preservation Planning, Administration, Access and Common Services. The entities are each comprised of several functions described in detail in the standard. Organisations dedicated to long-term preservation are termed trustworthy digital repositories.²

In practice repositories are implemented in various ways according to on the one hand, the available resources, and on the other, the nature of the organisation and the assets in its trust. The repository may, for example, be private or public, it may have a business need or a legal mandate to preserve, and the duration of preservation may be definite or infinite. The assets, whether individual objects, or groups of objects, may represent documents, books, images, films, web pages, etc., in various qualities. Here quality is used as a collective name for different properties of the assets relating to their content, context, appearance, structure and behaviour³ as well information security,⁴ including authenticity, confidentiality, integrity and availability. On a more detailed level quality also relate to format types, a book may, for example, be saved as a pdf or word document, or as tiff images; preservation strategies, whether based on migration or emulation; and how the repository is organised, e.g., as a distributed or centralised system.

In order to allocate sufficient resources for digital preservation activities, repository managers obviously need to know how much they cost. However, as may be perceived from the above examples of the diversity in the digital preservation scenarios and the comprehensiveness of preservation activities in depth as well as in breadth, it is a complex task to account for the costs and the cost drivers of digital preservation. Furthermore, as opposed to traditional preservation of, for example, paper-based records, digital preservation services have not yet fully matured. This means that costing of digital preservation is not only complicated by constantly evolving technologies, but also because best practice has not been established.

Over the last decade several cost models have emerged to support cost assessment, some aimed at specific sectors or materials, others more generic in nature: The National Archives of the Netherlands' cost model for digital preservation,⁵ the NASA Cost Estimation Tool (CET),⁶ the LIFE Costing Model,⁷

the Keeping Research Data Safe (KRDS) model,⁸ the Cost Model for Digital Archiving,⁹ the Cost Model for Digital Preservation (CMDP),¹⁰ the DP4lib cost model,¹¹ the PrestoPRIME cost modelling tools,¹² the California Digital Library cost model,¹³ and the Economic Model of Storage.¹⁴

The costs of the preservation activities cannot be viewed in isolation, but need to be balanced against the benefits that they represent to stakeholders. These aspects of the economies of digital preservation were investigated by the Blue Ribbon Task Force on Sustainable Digital Preservation and Access, and resulted in two comprehensive reports^{15,16} and initiated the development of the Economic Sustainability Reference Model.¹⁷ To this end the KRDS project has also developed tools for analysing benefits¹⁸ and in the Cost Model for Digital Archiving benefits are expressed via the Balanced Scorecard methodology.¹⁹ Strategies for funding digital preservation are also described in a recent report on alignment in digital preservation initiatives.²⁰

Accounting for the costs of preservation activities, their relationships, variables, and underlying pre-conditions in a structured manner remains highly challenging and so far no consensus has been reached within the community on how to model the costs of preserving digital assets.

In this paper we examine which cost data are needed for managing a repository, and how the costs of preserving access to digital assets are influenced by other economic factors. Based on this examination

and with a view to existing cost methodologies we analyse the constituents of a generic cost model, capable of accounting for different types of assets and organisations. This work is based on experience from the Danish CMDP project (2008-2012) in which a cost model and an associated spreadsheet tool for assessment of the cost of preserving cultural heritage materials have been developed.²¹ Wherever relevant the CMDP model and tool have been used to exemplify how different challenges in cost modelling may be addressed.

2. Required Preservation Cost Data

2.1 Budgeting

Cost data for digital preservation is needed for preparing and controlling budgets. Repository managers need to know the total costs of all activities involved in the digital preservation lifecycle and the distribution of costs over individual activities, and groups of activities. They must also be aware of which activities are included in the preservation lifecycle and which are not. Understanding the distribution of costs is also important for identifying when the costs of specific activities fall due, e.g., when re-investments in storage media or systems are required, and for pricing specific preservation services in relation to outsourcing. Likewise, cost data is needed for evaluating the effect of adjusting the cost of one lifecycle activity on the other activities, e.g., if the richness of metadata provided at ingest is decreased to save costs, it may induce increased costs at access. In addition, it is needed for identifying the most important costs, which in particular require careful monitoring.

Managers must also know the accounting principles underlying cost figures. For example they need to know if the cost includes the full economic costs, i.e., the direct investment and operation costs, as well as indirect costs, such as the cost of general administration and facilities (overhead). If indirect costs are included they must in addition know how they have been distributed, e.g., as a percentage over all lifecycle activities, or on individual activities. Managers also need to know how possible financial adjustments, e.g., inflation, are accounted for. Likewise, they must acknowledge the assumptions on which estimates of future costs are based, e.g., are assumptions based on projections of historical data or is status quo assumed in price development.

2.2 Optimisation

Cost data is also required for adjusting expenditures to the projected financing and for potential optimisation of preservation activities. Within an existing budget framework it may be possible to enhance the preservation systems and processes, without compromising the quality, and thereby improving the overall cost efficiency of the preservation activities. This may, for example, be achieved by engaging in partnerships that allow exploiting economies of scale, e.g., in the area of archival storage, or economies of scope, e.g., by providing more versions of the same asset. Going beyond the existing framework, budgets may be balanced by attracting additional funding from external stakeholders or by internal re-allocation of resources within the organisation. It is also possible to adjust budgets by reconsidering the quantity and/or the level of quality of the assets to be preserved.

²¹ “The Cost Model for Digital Preservation,” accessed August 2012, www.costmodelfordigitalpreservation.dk.

2.3 Evaluation of alternatives

Cost data is also needed for comparing the costs of alternatives, e.g., the costs of applying different preservation strategies or the cost of increasing certain quality properties of the assets. In order to execute such comparisons managers need to be able to account for the quality of the preservation activities. If, for example, the cost of migration processes are compared it is necessary to specify, among other things, how well significant properties of the assets are preserved; how many errors in the process are acceptable and how many random samples are needed to detect errors.

2.4 Economic aspects

The nature of the assets and the organisations that are responsible for preservation and access motivate stakeholders', i.e., owners, producers, and consumers of the assets, requirements for the quality of the assets. Based on these requirements the repository managers specify the quality of the assets. This value proposition represents a certain value to stakeholders and determines their willingness to pay for the assets (see Figure 1).

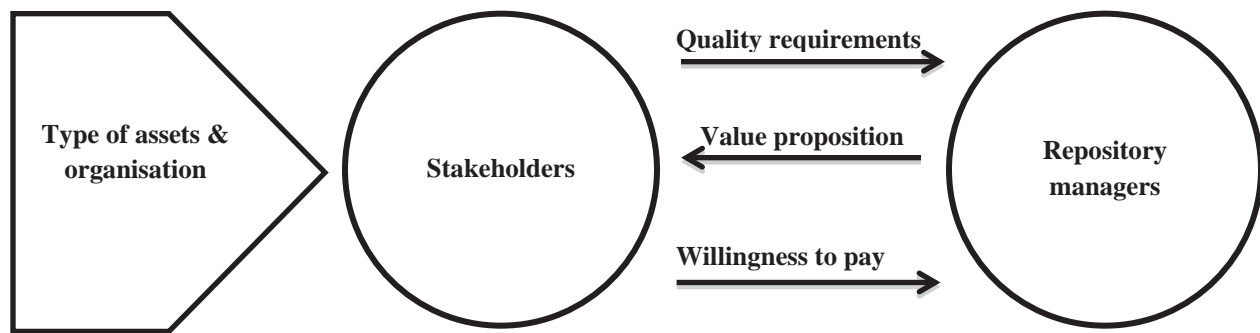

Figure 1. Interactions between stakeholders and repository managers.

Thus, the costs of the preservation activities and the associated quality of the digital assets and services provided by the repository must be seen in relation to the perceived value and stakeholders' willingness to pay for the assets. Whenever changes in the quality of the assets occur they are likely to influence how stakeholders value the preserved assets and thereby their willingness to pay. A digitized book may, for example, gain value if the file is processed by an OCR program to make the text searchable. Likewise, making a repository's degree of trustworthiness explicit by investing in audit and certification could potentially increase revenues for a preservation service provider. Therefore managers must also be aware of the business models underlying the repository, and understand the mechanisms by which the value of assets and preservation services is driven.

2.5 Towards a generic cost model

In order to optimise digital preservation activities and identify best practices it is important to account for the costs and the quality of the activities in a complete and consistent way that further allows for comparing different scenarios.

Ideally, a generic cost model should apply the same methodology for accounting for the costs of all types of assets, preserved in different qualities, and by different preservation strategies, services and organisations; and it should therefore describe the required preservation activities at a conceptual and implementation neutral level. However, costs cannot be assigned on the conceptual level; it is only possible to cost actual implementations. The reason is that activities can be implemented in several ways resulting in different qualities and costs. Thus it is prerequisite to specify the actual implementations in order to assign resources to it, and cost assessments are therefore based on a series of assumptions about the quality of the assets and how they are preserved.

In the CMDP project there is a loose distinction between a cost model and a tool: The CMDP model defines the principles and methods for assessing costs of preserving assets, whereas the CMDP tool makes these principles operational and enables actual cost assessment in a spreadsheet.

A generic cost model should also determine the drivers of the costs in digital preservation. In addition, it should describe the principles for accounting, making financial adjustments, and projecting future costs.

Based on the examination of cost data required for costing digital preservation we propose that a cost model should comprise four building blocks: Profiles, Preservation activities, Cost drivers and Accounting principles (see Figure 2). These model components are described in more detail in the following sections.

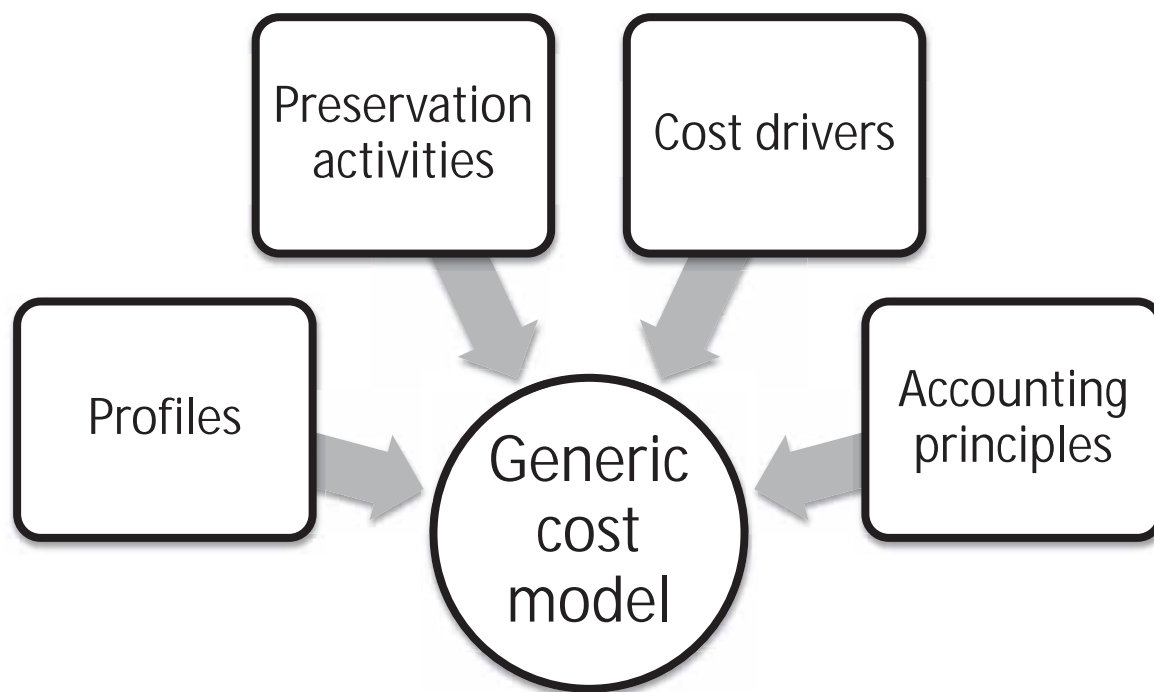

Figure 2. Proposed building blocks of a generic cost model

2.6 Profiles

One way to map between the conceptual cost model level and specific preservation scenarios is through the use of profiles that define the context of the cost assessment. For example a profile could represent an archive with a legal mandate to preserve cultural heritage documents or a private service provider offering

cloud storage. Well-described profiles could help understanding and interpreting cost figures and support cost comparisons.

In the CMDP tool it is possible to add contextual information via predefined dropdown lists where users can select, among other things, the type of organisation, e.g., archive, library; the purpose of preservation, e.g., business requirement, legal mandate; and potentially also quality requirements, e.g., regarding the confidentiality of the assets. The idea is to gradually develop a database with specific cost profiles for different scenarios, which can then be used for comparing sets of cost data.

2.7 Preservation activities

To ensure that the relevant costs are accounted for, the models must identify, describe and delimit all major activities in digital preservation in a complete, precise and systematic way; and describe the relationships and dependencies between the activities.

From its inception the OAIS Reference Model was proposed as the basis for costing the activities in digital preservation,²² and most cost models, including the CMDP, are more or less strictly based on the OAIS functional model. The OAIS functions are described at an abstract level that must be transformed into specific activities, which can then be allocated resources. For example, the OAIS standard states that the function Generate AIP under the functional entity Ingest “may involve file format conversions.” Before you can assess the costs of this function, you need to make a series of assumptions regarding the assets to be preserved, the applied preservation strategy, the technical and organisational design of the repository, and the required quality of the conversion.²³

In the CMDP project the functional descriptions in the OAIS standard and the flow between the functions were analysed to identify “cost-critical” activities, i.e., tasks, which take more than one-person-week to accomplish. Resources were then associated with the activities and cost dependencies identified. The resources and relationships were then expressed in mathematical formulas and made operational in the CMDP tool. So far expressions for the functional entities Ingest, Archival Storage, Preservation Planning, and Administration have been completed and implemented in the tool. The tool works by summing up the cost of the activities, functions and functional entities over the costing period.

2.8 Accounting principles

A generic cost model must define the applied accounting principles, i.e., the standards, rules and procedures used for recording and reporting accounting information to obtain consistency and accuracy in financial statements. The model should also state how possible financial adjustments, e.g., to account for inflation, are made, and how investments are depreciated.

As do most current cost models, the CMDP tool applies activity based costing,²⁴ and it refers to the International Cost Model Standard.²⁵ The tool breaks the cost of individual activities down in the

²² S. Sanett, “Toward developing a framework of cost elements for preserving authentic electronic records into perpetuity,” *College & Research Libraries* 63, no. 5 (2002): 388-404.

²³ U. B. Kejser, A. B. Nielsen, and A. Thirifays, “Cost Aspects of Ingest and Normalization,” in *Proceedings of the iPRES2011 Conference*, November 1-4, 2011, Singapore, pp. 1-10.

²⁴ R. Cooper, R. S. Kaplan, L. S. Maisel, E. Morrissey, and R. M. Oehm, *Implementing Activity-Based Cost Management: Moving from Analysis to Action* (New Jersey: Montvale, Institute of Management Accountants, 1992).

effective time required to complete the activity, measured in person-weeks, multiplied by the salary level, plus purchases, i.e., monetary value. It includes all direct expenses from investment, operation and maintenance, but it does not yet account for indirect costs (overhead). Depending on what type of cost analysis is needed, all investment costs can be depreciated linearly over their useful lifetime or they can be accounted for in the year that they fall due. The CMDP tool applies three salary levels, which are: manager, computer scientist, and technician. As all constants in the CMDP tool the actual salary levels can be individually adjusted to account for specific cases.

Predictions of preservation costs beyond just a few years are highly uncertain increasing exponentially over the years. This uncertainty is especially due to the difficulty of predicting future costs of technology. Future costs estimates can be based on projecting historic cost data and either assuming status quo or an increase or decrease in costs. However, uncontrollable incidents may occur that radically change the former course of the costs. For example, the cost of storage media per capacity has decreased over the last decades, but the flooding catastrophe in 2010 in Thailand, suddenly made prices increase significantly on the short term. Likewise, economic crises, such as in 2008, are likely to influence the rate of increase in costs of, for example, salaries. In addition, conflicting tendencies add to the uncertainty, e.g., on the one hand formats tend to become more complex, which, if all else is equal, will increase the costs of managing them; on the other hand, it has also been argued that formats tend to become more stable, decreasing the needed migration frequency in a migration strategy, and thus the costs.

Currently the CMDP tool does not account for financial adjustments. Ideally these should be included, but with a view to the overall uncertainty of the cost projections, this has not yet been given priority. Due to the lack of more accurate estimates, the CMDP tool assumes that costs remain status quo.

2.9 Cost drivers

The total costs of preserving assets are comprised of fixed costs and variable costs. The latter depend on the quantity and quality of assets and the expected duration of preservation, whereas the fixed costs, e.g., salaries, rents and utilities, are relatively independent of these, until a certain productivity level. Thus there are some minimum requirements for operating a repository that must be fulfilled; it must, for example, have facilities, systems and people in place, and these fixed costs can provide for a certain production of assets. If the repository does not exploit its capacity, the costs per assets are higher than if it operated at full capacity.

The quantity of assets to be preserved and their size (data volume) is obviously an important driver of costs, and especially storage costs.²⁶ In the CMDP tool quantity is accounted for by the annual increase in the amount of data (GB) to be preserved over the costing period. It is not yet possible to also enter the number of assets, which can in some cases counter that large files are disproportionately more expensive than small files.

A generic cost model must enable accounting for the quality of the preserved assets. The quality of the assets, including the type of format and how they are preserved, influences the preservation costs at different levels: From the lowest level representing the quality of the individual preservation activities, to the quality of groups of activities to the quality of the whole preservation lifecycle. The quality of the

²⁵ OECD, "International Standard Cost Model Manual to reduce administrative burdens," 2004, accessed August 2012, www.oecd.org/dataoecd/32/54/34227698.pdf.

²⁶ A. B. Nielsen, A. Thirifays, and U. B. Kejser, "Costs of Archival Storage," in *Proceedings of the Archiving 2012 Conference*, 2012, pp. 205-210.

format, e.g., its complexity and whether it is compressed or not, may influence the data volume, and thus the storage costs, but it may also affect the cost of managing the assets over time; all things being equal, simple formats preserved by the migration strategy tend to be less expensive to manage over time than more complex formats. One of the most important cost drivers here is the migration frequency and thus the expected longevity of formats. In the end the overall quality of the preservation activities defines the value that the assets accrue for stakeholders.

In the CMDP tool quality is only accounted for implicitly by the selections that users of the cost tool make when inputting data. Thus, the quality of the information security is, for example, partly defined by the selected number of instances (copies) of each asset and by the selected types of preservation systems, e.g., based on optical or magnetic media storage media, on-line, near-line or off-line solutions.

Likewise, the quality of the assets is partly defined by the selected types of formats and their ability to preserve significant properties. Currently, the CMDP tool assumes the use of the migration strategy with normalisation at ingest. It is possible to select the type of production format from a list and, if required, the tool also suggests suitable preservation formats. The tool can also account for the cost of ingesting the assets in their original format and keeping them status quo for a future emulation. However, it cannot estimate for the future costs of emulation tools to make the assets accessible if the original format has become obsolete. The tool predicts the longevity of the formats individually, but these pre-defined values can be changed.

The perceived duration of preservation is also a significant factor in cost assessment. The CMDP tool allows users to estimate cost over 20 years. In relation to the before mentioned difficulties in projecting cost, this is of course a very uncertain prediction. However, such estimates may still be of use because they show tendencies in cost projections and indicate when important costs are expected to fall due.

3. Discussion

One may ask if it is realistic to aim for a generic cost model capable of accounting for all possible preservation scenarios and use cases, including budgeting, optimisation, and comparing alternatives. Based on experiences from the CMDP project it seems possible to design a generic cost model for as long as the model is kept at a sufficiently conceptual level. The challenges rise however, on implementing the general principles in a tool that can make the actual cost assessments. Creating cost profiles for specific scenarios may be a way to meet this challenge. The profiles should include contextual descriptions of the nature of the assets and the organisation responsible for preserving the assets, and of the resulting requirements for the quality of the assets.

Archival storage represents the least complex and most mature area within the digital preservation lifecycle. It has received considerable attention with regards to cost modelling and it is the area from which most empirical cost data is available. Therefore, the developers of a generic cost model would likely benefit from using archival storage as the first area to develop, and then use the achieved results to leverage the remaining areas of the lifecycle.

Defining a common terminology related to costs and benefits of preserving digital assets is an important prerequisite for agreeing on requirements for a conceptual cost model. The terminology provided by the OAIS standard and other vocabularies developed within the digital preservation

community constitute a good basis, but they need to be extended with definitions of economic concepts and a business-oriented vocabulary.

The OAIS functional model provides a sound basis for accounting for cost of preserving digital assets, since it describes all major functions in digital preservation. Furthermore, it is already used for benchmarking organisations, e.g., in relation to audit and certification.²⁷ Cost models based on OAIS are structured accordingly, and other cost perspectives may be required, e.g., ones oriented at specific business processes.²⁸ However, if the cost methodology is sufficiently detailed and well-documented, it should be possible to assemble the activities deducted from the OAIS functional descriptions in groups that allow for analysing other specific processes.

The complexity of the digital preservation landscape entails very detailed cost models that are difficult to understand and use by anyone other than their own designers; on the other hand simpler models are often not accurate and precise enough to provide the required cost data. Thus there is a need for addressing the challenge between the complexity of the models and their user-friendliness.

One of the most difficult things in cost modelling is to identify and account for cost drivers. Especially, it is not straightforward to model how the various aspects of quality of the preserved assets influence costs. Initial work has been done to express certain quality aspects of information security mathematically,²⁹ but so far quality can only be accounted for in relatively subjective terms. At a high level, one way forward in benchmarking the quality of the assets could be to associate the costs of preservation with the certification rankings obtained by a repository through audit.

Assessment of quality is further complicated by the fact that the perceived value of a certain quality aspect is not an absolute measure, but dependent on the benefits that it represents to specific stakeholders. Thus, there is a need for combining cost models with benefit and business models to account for other economic factors.

4. Conclusion

Preservation cost data constitutes an important source for managing repositories, and cost data is required for various purposes including budgeting, optimisation, and evaluation of alternative preservation opportunities. They are also essential for the assessment of the value of the preserved assets and thereby stakeholders' willingness to pay for this value. The increasing amount of digital information to be preserved underlines the need for optimising the cost-efficiency of preservation activities and reaching best practices within the community. This requires complete and consistently collected cost data, which can be achieved through the use of a generic cost model.

Developers of cost models should therefore cooperate to develop a generic cost model to which profiles for specific preservation scenarios could be applied. Having created such a common framework it will be possible and necessary to have well-documented cost data to test and improve the coverage and

Kulovits, "Evaluation of Bit Preservation Strategies," in *Proceedings of the 7th International Conference on Preservation of Digital Objects (iPRES), Vienna, Austria, 2010*, pp. 161-169, accessed August 2012, <http://www.ifs.tuwien.ac.at/dp/ipres2010/papers/zierau-31.pdf>.

precision of existing models and tools. However, this is hard task since digital preservation is not yet a mature business with a best practice.

In order to allow for comparing the costs of preserving assets for different organisations it is also important to account for the quality related to the preserved assets and the value that it represent to stakeholders. Therefore, it is important to link cost models with economic models to represent both cost and benefits of preserving access to digital assets.

Economically Easy Method to Digitize Oversized Documents with Special Reference to Ola Leaf Manuscripts in Sri Lanka

L.M. Udaya Prasad Cabral

Head, Conservation & Preservation Division, National Library and Documentation Services Board, Sri Lanka, ubk@kb.dk

Abstract

Ola leaf manuscripts are the native writing medium of Sri Lanka. It had been prepared from the leaves of a tree commonly found in the country. Due to its location, Sri Lanka has a tropical climate. High humidity and temperature have badly damaged many Ola leaf manuscripts still deposited at ancient temples in the country. Preserving, obtaining information of and disseminating the knowledge contained in Ola leaf manuscripts are some key duties of the National Library. The National Library has adopted a procedure to digitize these oversized, uneven and brittle manuscripts for studying, as well as other digitization methods. Digitizing using a 50mm camera with copy table is very economical when compared with other methods. Sharpness of the pictures and three dimensional views provide natural attraction of digital files which take readers as close as possible to the originals. A specially prepared database offers a reader-friendly environment for those interested to gather knowledge from these native writings.

Author

Mr. L.M. Udaya Prasad Cabral is a Postgraduate Scholar. For his higher studies, he is carrying out research on protecting the archival materials from harmful environmental parameters of the tropical region. Study on preservation aspects of ancient library materials of Sri Lanka, Ola leaf manuscripts, is one of his fields of keen interest. Last year he was able to test a herbal extraction that can be used to preserve wooden objects as well as Ola leaf manuscripts. The National Research Institute of Cultural Heritage of Korea assisted him last year in his research through the Asian Cooperation Programme on Conservation Science. Presently he is working as Document Conservator and is the Head of the Conservation and Preservation Division of the National Library of Sri Lanka. The National Library of Sri Lanka acts as a convenor of the MOW programme in Sri Lanka. He provides his full cooperation to promote the MOW projects in the country, as the MOW programme is handled by his division.

1. Introduction

Sri Lanka is a country with glorious history and enriched with precious documentary heritage. Because the National Library is a guardian of the rich documentary heritage of the country, it has a keen responsibility to protect such heritage in its original format as well as disseminate knowledge inscribed in the documentary heritage among the country's younger generations. Ola leaf manuscripts are one of the native writing mediums that our ancestors used to communicate their thoughts and keep records in Sri Lanka's ancient society. These are basically prepared by pre-treating leaves of the *Corypha umbraculifera* tree, which was commonly found in Sri Lanka at that time. Ola leaf manuscripts have been a very popular writing medium since the 12th century A.D. It continued to be the main medium until paper was introduced by the Dutch Colonialists during the 17th Century.

According to historians, the 3rd century B.C. to 12 century A.D. was the golden period of Sri Lankan history. Our ancestors constructed huge pagodas, irrigation systems, storied buildings, reservoirs as big as the seas, etc., during that period. Modern technology couldn't complete such constructions even

today. Various other fields such as medicine, religious philosophy, etc., were also in a highly developed stage at that time.

Ola leaf manuscripts were the only writing medium at that time. Hence, knowledge on science, technology, religion, philosophy, astrology, medicine and other areas of knowledge were inscribed on Ola leaf manuscripts by our ancestors. Ancient temples became the guardians of these documents when foreign invaders attacked our country on several occasions. Our ancient society had a close connection with temples. They were also education centres. These temples generated, disseminated and deposited the knowledge. These were one of key duties of the temples, in addition to religious activities. Scholars gathered around the temples and these temples automatically became knowledge depository centres. Ola leaves had been the only writing medium, which had been passing indigenous knowledge from generation to generation. A considerable number of Ola leaf manuscripts have been protected in ancient temples until now. Ola leaf manuscripts contain invaluable information. Some Ola leaf manuscripts, especially on Buddhist religious teachings and practices, have been printed as books, but there are many manuscripts locked in almirahs at ancient temples that have not been read by anybody. Since monks believe these manuscripts reveal the route to treasures hidden by past kings, nobody gets permission to unlock the almirahs to read manuscripts for any purpose.

Sri Lanka is a tropical island located in the Indian Ocean just below the Indian peninsula. Its location is responsible for the high humidity and high temperature climatic conditions experienced in the country throughout the year. Ola leaf manuscripts deposited in the temples and libraries have been affected by these climatic conditions. Environmental parameters and unsuitable storage conditions have created conservation problems and accelerated the deterioration process of the Ola leaf manuscripts. It is obvious that almost all the Ola leaf manuscripts, which are considered as treasures of the documentary heritage of this country, are in danger, unless the National Library takes comprehensive steps, immediately, to rectify this problem.

The following conservation problems have been identified in the Ola leaf Manuscripts Collection Program, in substance:

- *Leaves sticking together* - Some leaves of the Ola books tend to stick together. Excess oil on the leaves is one reason for this, as the oil, in high temperature conditions, results in this sticky condition.
- *Fading letters* - The writings inscribed on Ola leaf manuscripts have become faded due to environmental conditions
- *Loss of flexibility* - This is due to loss of oil on the Ola leaves. At very low RH levels and in high humidity conditions, the leaves dry out and become hard. Such dry leaves can easily be broken into pieces.
- *Pest attacks* - Ola leaves are easily damaged by insects. The insects make holes through the leaves, rendering them unreadable as well as accelerating their deterioration.
- *Microbial attacks* - Fungi and bacteria have been found and isolated on the manuscripts. Favorable humidity and temperature for the microbes and nutrients substrate provided by the Ola leaf itself create this condition.
- *Discoloration* - Ola leaves have a tendency to become stained because of bio-deterioration.

Several collections of Ola leaf manuscripts are deposited at Depository Libraries in the country. The National Library, as the major depository library in Sri Lanka, has a huge collection of ancient Ola leaves. The Conservation and Preservation Division of NLDSB focuses its attention on preserving them as it is a valuable collection of the library.

2. Preserving Ola leaf manuscripts in two ways

The inimitable knowledge on medicine, science, technology and etc., contained in the ancient Ola leaf manuscripts of Sri Lanka might be lost to the world forever if a comprehensive program for preserving Ola leaf manuscripts is not commenced soon. The National Library is planning the preservation process to achieve two goals: to understand the value of the Ola leaf manuscripts preserved in their original form, and to make arrangements for preserving them using chemical and traditional treatments. On the other hand, they understand the value of the knowledge itself contained in the manuscripts, which is useful for the development of society and to satisfy the thirst for knowledge in our society. To achieve these goals, a newly defined digitization process has been introduced. It is expected that this method will fulfill readers' and researchers' eagerness for easy access to the manuscripts and save the readers valuable time, while helping to popularize these native manuscripts in the society much more than at present. Because physically handling and reading is harmful to the Ola leaves, as they are brittle, the digitization process was proposed as a suitable preservation method. One of the long-term expectations is to extract the scientific, medical, technological, etc., knowledge contained in these manuscripts using the facts on the manuscripts through comprehensive research.

3. Preserving the manuscripts in original forms

Two traditional herbal extractions were tested to preserve the Ola leaf manuscripts in their original form.

3.1 Experimental Method

This study investigated microbial and insecticidal activation against the two herbal extractions named as NL and DNA believed to have been used by our ancestors.

3.2 Extracted samples

NL and DNA herbal emulsions were extracted.

3.3 Strains and insects

The fungi strains¹ (mould) *Cladosporium cladosporioides* (H₁), *Aspergillus sydowii* (H₂), *Penicillium citreonigrum* (H₃), *Penicillium toxicarium* (H₄), *Penicillium corylophilu* (H₅) and *Alternaria spp.* (H₇) commonly found in paper materials were obtained from the micro lab of the National Research Institute of Cultural Heritage (NIRCH) in South Korea. Bacteria strains that were isolated from the ancient Ola

¹ A group of organisms of the same species, having distinctive characteristics but not usually considered a separate breed or variety.

leaves and fresh, untreated Ola leaves used in this experiment. For the analysis of insecticidal activities, *Lasioderma serricorne* (Cigarette beetles), which were bred in NIRCH bio-lab, were used. *Lasioderma serricorne* is the most dangerous library pest found in Sri Lanka.

3.4 Procedure 1

3.4.1 Assessment of Antifungal Activation

Pasteurized paper discs were placed on the cultured plates. The two types of herbal extracts were made to be absorbed in Pasteurized paper disc by 50 μ L by using a paper disc susceptibility measuring method. PDA and cultured mould species (H₁, H₂, H₃, H₄, H₅, H₇) were prepared in the same concentration (3 \times 10⁶ CFU) using spread plate methods. Petri dishes were sealed with sealing tape. Samples were incubated at 28°C for 4 days. Control samples were established adding the same amount of mould species without herbal extracts. Two samples of each batch were prepared. Antifungal activities were observed, resulting in the inhibition zone diameter (GZD).

3.5 Procedure 2

3.5.1 Assessment of Antibacterial Activation

Six bacteria species were isolated from ancient Ola leaves and fresh untreated Ola leaves. The top of each colony was touched with a loop, and the growth was transferred and spread in medium of *Luria bertani* in aseptic condition. The two types of herbal extracts were impregnated in Pasteurized paper disc by 50 μ L by using the paper disc susceptibility measuring method. Petri dishes were sealed with sealing tape. Control samples were established adding the same amount of bacteria species without herbal extracts. Samples were then incubated at 28° C for 2 days. Two samples of each batch were prepared. Antibacterial activities were observed, resulting in the inhibition zone diameter (GZD).

3.6 Procedure 3

3.6.1 Assessment of Ant insecticidal Activation

Pasteurized filter papers were fed with 200 μ L of herbal extracts in three concentrations: 0.3gml⁻¹, 0.1gml⁻¹, 0.05gml⁻¹. Twenty species of *Lasioderma serricorne* were positioned in each Petri dish. The filter papers were installed indirectly with test insects in the Petri dishes. Control samples were established feeding 70% Ethanol to the filter paper. These were bred in the incubator at 28° C and 60% RH for three days. The number of dead insects was examined every 24 hour, for three days.

3.7 Results

3.7.1 Anti-Fungal Effect of Herbal Extracts

Herbal extractions of DNA and NL controlled growth of three species of fungi in PDA media, which were incubated strains of (H₁), *Aspergillus sydowii* (H₂), (H₅) and (H₇), and DNA formed growth inhibition zones of 14mm, 14mm, 13mm, 13mm, and NL formed growth inhibition zones of 13mm, 12mm, 13mm, 12mm.

Figure 1. The extraction didn't show antifungal activity against species, (H₃) (H₄).

3.7.2 Anti-Bacterial Effects of Herbal Extracts

Herbal extractions of DNA and NL controlled the growth of species of bacteria that were obtained from the surface of new, untreated as well as ancient Ola leaves. Growth inhibition zones for three bacteria species--(E₆), (E₃) and (E₄)--were obtained from new untreated Ola leaves, while two bacteria species isolated from ancient Ola leaves--(E₂) and (E₅)-- were measured to confirm the antibacterial activity of DNA and NL herbal extracts.

Figure 2. Bacterial strain M₁ didn't show reaction against the herbal extraction.

3.7.3 Insecticidal Effect of Herbal Extracts

Neither DNA nor NL showed any insecticidal effects against *Lasioderma serricorne*. On the third day of the experiment several dead insects were found. These could have been natural deaths. However, insects gathered at one area of the Petri dish and tried to avoid areas of the filter paper, which contained the herbal extract.

Both herbal extractions of DNA and NL showed mild antifungal and antibacterial activities. Results confirmed DNA is more active than NL. NL contains several different ingredients than DNA. Results confirmed that neither herbal extract is highly effective against the insect *Lasioderma serricorne*, but it was observed that most of the insects had gathered in one area of the Petri dishes, which were the extraction-free areas. They may have tried to avoid contacting the herbal extractions. These extractions have some effects against insects. These are not insecticide effects but rather insect repellent effects. The herbal extraction of DNA was selected to use in traditional conservation before digitization.

4. Preserving Manuscripts by Digitization

Digitization is a practical solution that is able to satisfy readers who are interesting in Ola leaf manuscripts. The concept of digitization of library material as a preservation method is a new idea for our library. Actually it is still a developing idea in the library sector in our country. Lack of knowledge about this modern trend of digitization, and budgetary restraints for buying instruments are the main problems confronting us.

Ola leaf manuscripts come in different sizes. Normally, they are 4 to 5 inches wide, but their lengths vary from ½ foot to 3 feet. A manuscript normally consists of 10 – 250 leaves. Even large size scanners available in the country cannot accommodate some of these manuscripts. On the other, hand scanners are very expensive. The A₀ size scanner, which is named the ‘face-up’ scanner in the market, is common in libraries for digitizing books. These are most suitable for the digitization process.

Scanning is an easy and convenient technology that is used for the digitization of books. In this particular situation, however, such scanning technology is not suitable due to several reasons. First, as mentioned, the manuscripts (leaves) vary from ½ foot to more than 3 feet in length. Second, scanning the surfaces alone is not always enough. The nature of the Ola leaf manuscripts is completely different from that of books. For instance, in books printed letters are found on the surface of the paper, but in the case of Ola leaf manuscripts, the letters are engraved on the surface of the leaf; each letter has a depth. The Ola leaf surface is not smooth like paper, and not as clear and even as paper. Third, some Ola leaf manuscripts are very fragile and difficult to handle as they are large sized documents. The A₀ type face-up scanner, attached to two digital cameras is suitable for this purpose. However, several disadvantages are encountered with this instrument. As described earlier, most of the Ola leaf manuscripts are still found deposited in ancient temples in various part of the country. Digitization should be carried out at the respective temple premises. Handling a face-up scanner in a temple, which has limited facilities, is a very tiresome job. Several workers are required to perform this task. Transportation is also a difficult problem. Thus, scanning Ola leaf manuscripts using face-up scanners is a very costly job. We cannot be sure, in advance, that the final picture received after scanning will trace all the characteristics of the manuscripts. It might not provide/indicate depth of the letters as a three dimensional picture of the Ola leaves. Readers prefer to actually see the real Ola leaf manuscripts. So, three dimensional pictures are very important to fulfil the readers’ desires.

Digitization by camera is the best and most efficient method. The cameras are not heavy; one worker can arrange the instruments. In addition, a vehicle for transportation is not necessary. The working area is illuminated by two lights. Normal daylight can also be used.

The National Library of Sri Lanka was able to develop this economically easy, user-friendly method for digitizing oversized Ola leaf manuscripts, after investigating issues regarding digitization of Ola leaf manuscripts and available technologies in the country. This method is the result of a combination

of three fields: traditional conservation treatment methods, photography and computer literacy. This economically easy, user-friendly conservation and preservation method can be described in three steps:

- Step 1 - Brittle Ola leaf manuscripts are treated according to traditional treatment methods.
- Step 2 - Treated Ola leaf manuscripts are digitized using a digital camera.
- Step 3 - Digital data are edited and imported into a database.

4.1 Step 1

Brittle and deteriorated Ola leaf manuscripts are selected from the library for digitization. Letters on the Ola leaves fade when they age. It is very difficult to recognize the letters with normal sight or through a digital camera, which is unable to capture a clear picture without blackening of the letters. A Conservator has to blacken the letters using finely powdered charcoal derived from *Trema orientales*. The National Library of Sri Lanka was able to invent a mixture of herbal extractions that is similar to the extracts used by our ancestors from earliest time for protecting these manuscripts (DNA extraction). This solution reacts on the Ola leaf and protects it in various ways. Herbal extractions give high flexibility to brittle leaves. In addition, applying charcoal powder mixed with herbal extractions gives bright colour to faded letters. Some ingredients of the extract react as fungicides and bactericides. This prevents the growth of microorganisms on the Ola leaves due to high humidity conditions in tropical climates. The smell of the extract works as an insect repellent and protects the leaves from library pests. The adherence property of this extraction is put to good use and preserves Ola leaf manuscripts for a long time.

4.2 Step 2

At the second stage, Ola leaves are photographed using a digital camera. Suitable technical devices and necessary technical support are essential at this stage. Over-size images taken by the camera are not evenly clear and sharp at the edges, especially when the leaf is very long. Sometimes, the image is not bright enough to be easily read. Sometimes the image is not like in the original leaf, most probably because its colour differs from the original leaf.

Selecting a suitable camera is a very important factor in this process. Several technical aspects of cameras were tested. For example, different lens', apertures, shutters speeds and film speeds were investigated. It was determined that a full frame sensor 36X24 camera, which can accommodate a 50mm lens and capture images using more than 20 megapixels, produces a clear, sharp image for the digitization process. Even long leaves (3 feet) can be captured as a clear picture by this camera. The copy stand is an important device that is essential for this process. It provides support to the Ola leaf, which is placed on it parallel to the camera lens situated above it. The camera should always level to the supports where the Ola leaf is accommodated and care should be taken to ensure that the entire document (leaf) flush against copy stand during the entire process. For the best results, the working area should be lighted with two flash bulbs of at least 300W each. For the best results, lights can be softened by umbrellas for each light or by using soft boxes. Diffused light in this direction can be controlled remotely and more effectively by using a radio slave flash trigger. Verifying the colour profile of the computer ensures that the colour displayed on the screen are as close as possible to the colour recorded by the camera. The colour should be adjusted for the largest resolution made on the computer. This is very important.

A particular book of Ola leaf manuscripts consists of a bundle of leaves. Each bundle is photographed and the record is digitally stored as < name of manuscripts cropped > JPEG files.

4.3 Step 3

The computer operator edits the files using Adobe Photoshop and converts the files to pdf format. At the final stage, the digital data are imported into a computer database created by the Information Technology division of the library (Figure 3). Digitization of Ola leaf manuscripts by camera is a very cheap and practical method. This method might be very important for libraries in countries that have traditional library materials similar to Ola leaf manuscripts. It is an obvious solution for institutions that have limited annual budgets and are only able to start a digitization project at the minimal level. Inexpensive manual cameras can even be used instead of digital cameras. This digitization process has a lower budgetary requirement and requires fewer human resources to carry out. Hence, it is a practical and realistic method for developing countries. The high humidity and high temperatures of tropical climates badly affect the manuscripts. Therefore, all the original manuscripts should be stored in a room equipped with a climate control system. This would help to preserve the original manuscripts from harmful environmental parameters as well as the damages caused by physical handling by the readers.

Other

The National Library a guardian of the rich documentary heritage of the country, it has a keen responsibility to protect them as in original format as well as disseminate knowledge inscribed in the documentary heritage among the younger generations in the country. This data base consists of full digital copy of Ola leaf manuscripts deposited in various locations in the country.

Figure 3.

Readers can access the database (Figure 4) and obtain the desired information in a very short time. It saves readers and researchers valuable. Eventually, researchers might even be able to retrieve manuscripts on their desktop at home via the Internet instead of having to visit the library. However, at this stage, the National Library has not provided online access to the database due to laws and ordinances related to intellectual property issues. In the near future, it is hoped that the National Library will be able to provide online searching and retrieval facilities, with some restrictions.

Preserving Our Heritage

An Independent Advantage

Patricia Liebetrau

Abstract

Significant national funding is not made available for cultural and heritage digitization and preservation purposes in South Africa. Furthermore a lack of Government support for digitization initiatives has resulted in stifled development and a dearth of skills in this area. The situation has worsened in the current economic climate. There is a dire lack of IT skills for libraries and archives with few training courses and other opportunities for continuing professional development. Minimal digital project management expertise currently exists in the country. These and other challenges have contributed to stagnation and project failures. This paper looks at the valuable role played by independent professionals in assisting organisations to move ahead with projects and to overcome or manage these challenges. Very little has been written on this topic, especially in Southern Africa, so this paper draws largely on personal experiences in collaboration with other independents, from a practical perspective.

Author

Patricia Liebetrau is an independent information professional providing consulting services and training for media development in South Africa and beyond into Africa. Prior to this she worked with Digital Innovation South Africa (DISA) (<http://www.disa.ukzn.ac.za>) over a period of 10 years. This innovative project developed an extensive online digital repository of open access resources around South African heritage that assisted new curriculum development and contributed to e-learning and e-research initiatives. Her skills and interests lie in research and implementation of digital technologies in creating information and knowledge resources for libraries, archives and memory organisations. Her area of specialisation is metadata and she was the first metadata librarian in South Africa. Her current focus is on change management and leadership development for the library and archive profession to support academic scholarly endeavors.

1. Introduction

Cultural heritage organisations and archives, including community archives, are increasingly utilising and exploring ways of using evolving digital technologies to enable their collections to be discovered, accessed and utilised in a Web environment. Many of these organisations have extensive, important and interesting physical collections and resources. Digital technologies are enabling these organisations to reach an online audience.

These same technologies provide countries in continents such as Africa with an overdue opportunity to claim their presence in a global environment. Rich but endangered national cultural heritage resources from national archives, Universities, community archives and other organisations can be digitized and made available for research purposes and preserved for long-term access. The process of digitization itself is a preservation step by minimising handling of precious original resources and artefacts. However once digitized the challenge becomes one of managing preserving data for the long-term.

However several challenges are slowing the rate of digitization efforts in South Africa and in Africa as a whole. Additionally, the fragility of digitized resources can pose a real and underestimated danger.

Digital chaos, resulting from a lack of skills, knowledge and understanding, can only too easily undermine a digitization project. Unsuitable hardware and software purchases, inadequate infrastructure, use of proprietary software with expensive licensing requirements, inconsistent or inappropriate use of international industry standards and other factors impede successful large scale digitisation

Many libraries and archives in Africa have been fortunate in the past in securing funding from philanthropic organisations, private funders and other sources of funding for specific projects. However with the current economic climate, many sources of funding are simply no longer available to assist organisations undertake digitization projects on a large scale. Even more concerning is that sufficient funding is often not available after the end of the project to provide for preservation and ongoing Web access costs. Without strong national support, funding and infrastructure, responsibility falls to individual organisations to provide digitization budgets and cover the associated infrastructure and data preservation costs. In the absence of committed funding or exit strategies, projects may ultimately have to be parked or abandoned. Ultimately the vision is to move from externally funded projects to institutionally committed programmes.

2. South Africa

South Africa, situated at the southern tip of Africa, currently has a population of just less than 60 million people.¹ The country itself is geographically divided into 9 provinces. It is a diverse and multicultural country with 11 official languages although English is widely spoken and considered to be the *de facto* language.

The Internet World Stats website² reports that as of 31 December 2012, South Africa had 6.8 million internet users, just less than 5% of Africa's total internet users. At 140 million estimated internet users in Africa, South Africa is the 5th largest user on the African continent. Low internet usage across the Continent impacts on the ability of Africans to leverage this media to enhance the visibility of African (digital) heritage and academic scholarly output.

3. South African Initiatives

South Africa does not currently enjoy widespread national funding and extensive governmental support for digitization initiatives such as that provided by JISC³ in the United Kingdom. Universities are largely funding their own individual digitization projects, often supplemented by foreign funding, to support e-research and provide global access to their own scholarly resources by building Institutional Repositories (IRs). The National Research Foundation (NRF) has created a National Electronic Theses and Dissertations (NETD) portal⁴ for searching, browsing and accessing South African theses and dissertations from South African Universities that have their repositories open for harvesting. The long-term responsibility of preservation of the data resides within the Universities. A grant from the Carnegie Corporation of New York has enabled the NRF to assist previously disadvantaged Universities with training and hosting of their ETDs on a server housed at the NRF.

² <http://www.internetworldstats.com/stats1.htm#africa> (Accessed 26 August 2012).

³ <http://www.jisc.ac.uk/aboutus.aspx> (Accessed 27 August 2012).

⁴ <http://www.netd.ac.za/> (Accessed 27 August 2012).

Under the auspices of the same project, a collaborative publication “Managing Digital Collections: a collaborative initiative on the South African Framework”⁵ was published by the NRF in 2010 as an introductory guide intended to supplement a series of regional training workshops aimed at assisting Universities and heritage organisations gain valuable skills. The regional workshops have, sadly, never taken place.

Several Universities are considering, or are already digitising their own unique resources such as those housed in University Archives and Special Collections. Many of these collections are unique and provide a rich insight into our heritage. The University of Cape Town, for example, has digitized several interesting collections housed in their Manuscripts and Archives Department.⁶ One such project is the digitization of photographs of the San (Bushmen) peoples between 1910 and the late 1920’s. The photographs were taken on numerous expeditions made by Dr Wilhelm Bleek, his sister-in-law Lucy Lloyd and his daughter, Dorothea, to the northern Cape Region of South Africa where the San people lived. This collection, possibly the most unique of UCT Special collections, is listed on UNESCO’s Memory of the World register as being heritage of international importance. The full collection of notebooks, oral histories, drawings and photographs are held across three institutions—South African National Library, the National Gallery and University of Cape Town.

The Campbell Collections of the University of KwaZulu-Natal⁷ is a centre of research excellence with an archive, a museum and a library of rich holdings reflecting the social and cultural heritage of KwaZulu-Natal, South Africa. Several thousand early 20th Century historic photographs from this collection have been digitized and made available online to researchers around the world. The fragile originals are now less frequently handled adding to their longevity. This project was made possible with funding from the Andrew Mellon Foundation.

These and similar projects, although often limited in scope, provide online access to important South African heritage, which would otherwise be little known outside the country. Many of these projects have relied on foreign funding to cover costs of digitization but long-term preservation costs need to be covered by the University itself.

Collaborative digitisation efforts between Universities in South Africa are generally not the norm but two important collaborative initiatives do need mentioning. These are the Digital Innovation in South Africa (DISA)⁸ digital archive of South African socio-political resources and the University of Witwatersrand Rock Art Digital Archive.⁹

3.1 DISA

DISA started as a project, funded by the Andrew Mellon Foundation in 1999. The vision was to digitize and create a freely accessible online scholarly resource focusing on the socio-political history of South Africa, particularly the struggle for freedom during the period from 1950 to 1994. It was a national

⁹ <http://www.sarada.co.za/> (Accessed 27 August 2012).

collaborative project, the first of its kind in the country, partnered by the several South African Universities, The National Archives and The National Library. Selected periodicals were sourced from around the country and missing issues sourced from the USA and the UK. Complete runs of “hard-to-find” anti-apartheid journals were for the first time made available “virtually”, in full text, for a global audience.

The second phase was more ambitious. Archival resources identified by scholars as being important documents in the struggle for freedom were identified from a number of institution’s archival records. These primary source documents came with copyright and privacy issues which were navigated with much paperwork and many hours of correspondence and evoked criticism from some quarters that the resources were “cherry-picked” and were therefore taken out of context. Being funded by an American funder also evoked cries of imperialism.

The funding came to an end in 2009 and without a financial commitment from the partners, a clear exit strategy and on-going funding for preservation of the content, the website and resources have been parked pending negotiations with the National Library of South Africa to maintain the national resource. They will, however, require training and funding in order to undertake the task. The host University declined to maintain the resource for the long-term. The website and content is maintained by volunteers.

Despite criticisms, the project was successful in making available a large number of multimedia resources that have been and are still being extensively used around the world by researchers. What is important in the context of this paper is the significant technological skills development and transfer that took place as a result of the project. This included digital conversion skills, metadata, IT for digital resources and IP for digital libraries and could realistically have created a national platform to provide momentum for digitization efforts. It didn’t. Organisations were “waiting” for “national” policies and strategies and support. The training in partner institutions did however provide the impetus for development of several important heritage projects such as the San photograph digitization project at UCT, mentioned earlier.

3.2 The African Rock Art Digital Archive

The African Rock Art Digital Archive (SARADA) project, the largest of its kind in the world and based at Wits University in Johannesburg, is a “milestone in the digital preservation of Africa and the world’s cultural heritage”¹⁰ and a good example of a national collaborative project. It is funded by The Ringing Rocks Foundation and the Andrew Mellon Foundation and brings together scattered collections into one “virtual” space. Images have been scanned from Museums, Universities and private collections around the country. A significant contribution to the sum of African heritage is being made available online through this project.

It is precisely these kinds of projects that are able to drive cutting edge technological developments and define digital information management boundaries but widespread skills deployment is urgently required to push digitization initiatives forward in South Africa. Valuable skills remain within the project, often invested in short term contract staff and student assistants until project insecurity drives them further afield, taking their skills with them, often outside the country!

¹⁰ <http://www.sarada.co.za> (Accessed 27 August 2012).

4. National Register of Digital Initiatives

Browsing through the NRF register of digitization initiatives in South Africa¹¹ (another project funded by the Carnegie Corporation of New York) indicates that the majority of the initiatives listed on the database are still in the planning stage with just a very few projects in progress or completed. What is holding back the realisation of these initiatives?

5. Public Sector

Examining some of the reasons for the slow uptake of digitization in the Public Sector it is clear that the lack of national leadership, a national policy and a national strategy providing support for a standardised approach to developing digital resources has resulted in organisations “waiting” for national guidance before proceeding. A draft of the long awaited National Policy on the Digitisation of Heritage Resources¹² was made public in 2010 for comment but remains to be published.

Added to this is the lack of national funding to undertake digitization projects and limited training options available for continuing skills development. This has resulted in a dearth of suitable skills and a paralysis in the industry.

6. Private Sector

The situation in the Private Sector is different. The positive effect of a Web presence on scholarly communications is one that University Research Offices are increasingly keen to capitalise to their own advantage. Librarians, with the mandatory skills for managing information, are being tasked with developing online resources and making academic staff and student output available on repositories. The challenge facing libraries and special collections in South African (and African) Universities is the re-skilling of existing professional staff to undertake the new responsibilities that come revised job descriptions. University Librarians are hard pressed to find solutions.

Training is required at all levels, from management level to assistant level and covers a vast spectrum such as digital project management, metadata expertise for content and data management, digital media conversion, digital industry standards, best practices and guidelines. Many companies in South Africa do provide digital conversion services but not metadata creation services.

Training opportunities from commercial companies are few and far between, expensive, and often require extensive travel with long periods away from home. This is one of the roles that independent professionals can and are currently fulfilling.

¹² Liebetrau, *Managing Digital Collections*.

7. Independent Professionals

According to the website of The Association of Independent Information Professionals¹³ in the USA, “independent information professionals use high-level skills in finding, managing, applying, and communicating information, and they pursue their calling with an entrepreneurial spirit” ...and they ...”use the skills of librarians, private investigators, database searchers, market researchers, competitive intelligence researchers, writers, indexers, and other professions in their work.” This correlates with the observations of Wamundila et al.,¹⁴ who view knowledge and content management specialists as a special breed of information professionals. Furthermore these “super” information professionals manage knowledge that helps in reducing organisational operational costs, improves income flow and operational performance.

In the context of this paper the term Independent Professionals is used to include independent information *and* information technology professionals.

In South Africa, independent professionals are providing much needed skills and services in professional training and the application of innovative technology to support cultural heritage, library and archival digital resource requirements. They are plugging a gaping hole by providing an important body of knowledge and expertise, coupled with local understanding. They provide a level of service provision that is not otherwise available in the country, especially in the rapidly evolving technology environment where innovative solutions are required to suit an African context.

Independents are well placed to provide training that is at the cutting edge, but relevant, customised and suited to the level and understanding of trainees. Training for ongoing professional development is currently the most pressing segment required to hasten the rate of digital initiative development. This encompasses all aspects of the *new roles = new job descriptions = new skills* scenario accompanied by change management and leadership development requirements to support a solid foundation for this transformation. The Centre for African Library Leadership (CALL)¹⁵ at the University of Pretoria was developed to address the need for library leadership training and skills development of library managers in a formal programme approach. However, it is not only managers that benefit from leadership development.

Two case studies are discussed here as illustrative examples of the roles played by information professionals.

7.1 Mentoring Programme

A Mentor Programme has been designed and implemented to assist libraries expand their services and tackle new challenges in building digital resources. After adopting many training approaches it became evident that short courses tended to be unsatisfactory for many trainees as they didn’t have the understanding of all the “parts” fitting together. Frequently librarians would complain that they weren’t able to deal with the IT requirements or IT technicians would complain that they couldn’t understand librarian’s needs. Librarians and IT professionals have not traditionally in the past worked together but

¹⁴ Sitali Wamundila, Felesia Mulauzi, Naomy Mtanga, and Benson Njobvu, “Meeting the training needs for knowledge and content management specialists: case study of Southern African Universities” (paper presented at SCECSAL 2012 Conference, Nairobi, Kenya, 4-8 June 2012), p. 5.

¹⁵ <http://www.library.up.ac.za/carnegie/centre.htm> (Accessed 27 August 2012).

now need to work closely with each other now and it seems that it is not a good marriage. Thus the “whole (integrated) picture” was required to be experienced and understood, over a period of time, in a supportive, non-threatening environment. The mentor programme was developed to satisfy this need. A unique aspect of the programme is the specialised and individual approach tailored to each Mentee while satisfying the requirements of their own institution. This approach is recommended in findings in an investigation to establish the (then) current state of University libraries in Africa.¹⁶ Extensive hands-on training is accompanied by development of guidelines, best practices and quality assurance processes. Assisting organisations in documenting policies, guidelines and best practices are essential in saving time and money due to changes in management and staff turnover. No point in re-inventing the wheel. Documentation can be versioned as changes are introduced and adapted for various projects. They can be made available on an organisational library website and used as a template by others to make the process easier and more efficient.

The mentoring programme is particularly useful for the more geographically remote Universities in African countries where little or no specialised training facilities are available locally. This approach equips Mentees with complete confidence in dealing with project management, scoping, assessing equipment requirements, metadata creation, long-term preservation, and ensuring high quality deliverables at the end of the project. A train-the-trainer approach, where the trainee is tasked with training colleagues and staff back home after completing the Mentor programme, has proved economically viable for many small libraries.

7.2 The Ulwazi Community Memory Programme (<http://www.ulwazi.org/>)

Another innovative way that independent professionals are making a difference is in the use of mobile technologies to assist communities build indigenous knowledge resources.

Durban is a busy port city on the east coast of South Africa. In the early part of the twentieth century Durban’s development as a colonial city, was clearly reflected in styles of architecture, in dress codes, in modes of transport and others. A hundred years later, and the city has developed into a thriving multicultural commercial and industrial African city, with a population of around 3 million inhabitants. The local museums and archives in Durban hold rich resources about the local history but it is the Zulu heritage which is the least documented and urban migration threatens the loss of oral histories traditionally passed down through families. The eThekweni Municipality of Durban has an infrastructure of around 89 public libraries. The Ulwazi Project was developed, with funding assistance from the Goethe Institute, as part of the Public Library’s mandate to establish online indigenous resources as an integral part of services to the communities they serve. It comprises a portal, wiki and blog where indigenous knowledge from the local Durban communities can be submitted, uploaded and preserved using Web 2.0 technologies. “The utilisation of the combination of open-source and social media applications for archival and heritage purposes makes this project unique in South Africa.”¹⁷

¹⁶ Diana Rosenberg, *Towards the digital library: findings of an investigation to establish the current status of university libraries in Africa* (Oxford: International Network for the Availability of Scientific Publications (INASP), 2005), 17.

¹⁷ Elizabeth Greyling and Niall McNulty, “How to build an Indigenous Digital Library through Community Participation: The case of the Ulwazi Programme” (paper presented at SCECSAL 2012 Conference, Nairobi, Kenya, 4-8 June 2012), p. 9.

Following on the success of the original Project, the Ulwazi Programme sought ways to develop an innovative model to capitalise on the phenomenal growth of mobile technology, specifically those with browser technologies. It is estimated that cell phone usage in Africa is now close to 70%.¹⁸ To make the project more relevant to the local community, the content on the website was made accessible to users through their cell phones. Then the concept was extended to enable the collection of indigenous knowledge material using mobile phones. “The initiative showed that cell phones could be used productively as a tool in the exchange of indigenous knowledge...”¹⁹ This enhances the archival knowledge experience for members of local communities. The eThekweni Municipal Library has assumed responsibility for the long-term curation of the data.

8. Preservation of Digitized Resources

“In sub-Saharan Africa, the volume of digital information media produced is comparatively small, but preservation challenges are particularly acute. If digital media cannot be preserved, part of the Africa’s heritage is being lost.”²⁰

Despite setbacks and challenges, there are important projects digitising heritage resources and providing access. Some of these projects have stalled or been parked for lack of funds to support long-term preservation. Very few are actively focused on preservation issues in a sustainable way. One could argue that digitization in itself is a form of preservation—by making a digitized surrogate, the original physical form is less handled and better preserved. Also by making resources available you are (in a way) preserving heritage by keeping it alive. But the data also needs to be kept alive...! Cohesive efforts will need to be implemented as more resources are digitized. The lesson learned from DISA is that long-term curation and preservation is not an add-on luxury but requires attention from the beginning of the project.

9. Conclusion

A measure of the contribution that independent professionals are making is difficult to assess. In the short term, tangible success could be measured by increased digitized content, websites, available guidelines and policy documents. Referrals and requests from satisfied clients are always a good measure.

Currently, independent professionals work largely in a loose networked environment, respecting each other’s skills and professional ethics. Three of the final recommendations from the INASP investigation into digital library needs in Africa²¹ were:

- Best practice in user education for the digital environment should be summarised and disseminated to ensure efficient use of digital library services.
- Working with partners, develop and support continuing education and training programmes for librarians using a variety of approaches and methodologies.

²¹ Rosenberg, *Towards the digital library*, p. 28.

- Support consortia to build strong networks and expertise within their countries/regions, so enabling them to take on wider coordination and advisory roles and to foster collaboration among libraries involved.

It is possible that a more formal Association could benefit the heritage sector by playing a more proactive role in developing tools, promoting advocacy and fostering new partnerships, cross-institutional collaborations and mentoring initiatives. This would require a subscription model to sustain and provide for staff and operational costs. In the interim it can be said that independent professionals can, and are, making a positive, if modest, contribution to the state of the art of preserving our culture.

Is A New Legal Framework Required for
Digital Preservation or Will Policy Do?

Is a New Legal Framework Required for Digital Preservation or Will Policy Do?

Building a Legal Framework to Facilitate Long-term Preservation of Digital Heritage: A Canadian Perspective

Tony Sheppard

Professor, Faculty of Law, The University of British Columbia, Canada, sheppard@law.ubc.ca

Abstract

What is “law” and how can law reform facilitate digitalization and preservation of cultural heritage? The current UNESCO Charter on the Preservation of Digital Heritage contains an excellent start, but would benefit from defining its terms and broadening its scope to add issues that States should consider in developing their laws. These issues start with State constitutions, and include tax reform, copyright law reform, protection and preservation of the cultures of indigenous peoples, and the practical problems of law enforcement in the digital era. Some Canadian solutions are discussed in this paper. It is also suggested that the role of UNESCO as contained in the current Charter could be expanded to include the drafting of model provisions with commentary to assist States in improving their domestic laws.

Author

Tony is a Professor in the Faculty of Law, The University of British Columbia, and a retired member of the Law Society of British Columbia. His research interests include the law of evidence and admissibility of digital records. He currently teaches courses in taxation law, law of equity and real property law in the Faculty and supervises graduate students. He is actively involved in law reform and interdisciplinary projects in collaboration with members of UBC’s School of Library, Archival and Information Studies (SLAIS) and with many others around the world.

1. Introduction

The provocative topic of this panel, “Is a new legal framework required for digital preservation or will policy do?” might be misunderstood as it appears to offer a false dichotomy between law and policy as alternatives, and that it would be open to a society governed by the rule of law, to bypass the formalities of law by adopting the expedient of policy. In a state where the rule of law prevails, it is impossible to divorce policy from law, however. Policy is subject to the rule of law through judicial scrutiny. Governmental policy must be founded on legislation. Under the rule of law, Parliament must enact the legislative basis for the iteration of policy. On this legislative basis the Executive can develop policy, which would take the form of delegated legislation, known as “regulations.” The rule of law only requires that the bare bones of Parliamentary intent to authorize the Executive to make regulations appear in the statute, leaving plenty of scope for policy development in regulations. The rule of law requires that regulations must be subject to judicial review to ensure that they do not exceed the underlying legislation.¹ The *United Nations Millennium Declaration* articulates the supremacy of the rule of law and connects it with digitization and cultural heritage.²

The author gratefully acknowledges the many helpful comments and suggestions offered by Ken Cavalier, Ph.D., LL.M., LL.B., and B.A. on a draft of this paper.

¹ *Catalyst Paper Corp v North Cowichan (District)*, 2012 SCC 2, [2012] 1 SCR 5 at paras 12-15.

² UNGAOR, 55 Sess, UN Doc 55/2 (2000), Articles 20 [digitization], 24 [rule of law] and 25 [cultural heritage].

Law features prominently in the UNESCO, *Charter on the Preservation of Digital Heritage*.³ First of all, the *Charter* defines the scope of digital heritage to include “legal” heritage materials.⁴ Second, the *Charter* identifies “the lack of supportive legislation” as a factor contributing to the endangerment of digital heritage worldwide.⁵ Third, the *Charter* urges States to adopt legal measures safeguarding digital heritage.⁶ Fourth, and giving rise to the topic of this article, the *Charter* recommends that States enact appropriate legal frameworks to secure the protection of their digital heritage.⁷ The *Charter* states that a legal framework for the protection and preservation of digital heritage should provide for legal deposit and for reasonable access by the public to the deposited heritage material.⁸ States are also encouraged to develop another legal framework for ensuring “authenticity” of digital heritage and to prevent its “manipulation or intentional alteration.”⁹

This paper offers some suggestions whereby the law might cease to be part of the problem, as is alleged by the *Charter*, Article 3, and become part of the solution in eliminating or reducing impediments to the preservation of digital heritage. Protection of cultural heritage is not only an important Canadian constitutional value, but also a worthwhile endeavor in its own right.¹⁰

What reforms might be included in a State’s effort at building a comprehensive series of legal frameworks to facilitate long-term preservation of digital heritage? A revised *Charter* might define “legal frameworks” to inform States of the broad scope of issues to be addressed, including constitutional, fiscal and taxation, and copyright impediments to the preservation and protection of cultural heritage. The perilous future of indigenous cultural heritage invokes the honour of the Crown as protector of human rights and cultural diversity in relation to Canada’s First Nations, Métis and Inuit peoples.

The *Charter* raises another issue: what is the most constructive role for UNESCO to play in regard to the legal aspects of preserving and protecting digital heritage? Article 12 of the *Charter*, which defines “[t]he role of UNESCO” only refers to proposing standard “**legal**” and technical guidelines, to support the preservation of the digital heritage.”¹¹ A revised and amended *Charter* might propose a broader role for UNESCO in building model legal frameworks to overcome specific legal impediments, which it would recommend for adoption by State legislatures.

³ UNESCO, *Charter on the Preservation of Digital Heritage*, online: http://portal.unesco.org/en/ev.php-URL_ID=17721&URL_DO=DO_TOPIC&URL_SECTION=201.html (15 October 2003) [*Charter*].

⁴ *Ibid.*, Article 1, which identifies “digital heritage” as follows: “The digital heritage consists of unique resources of human knowledge and expression. It embraces cultural, educational, scientific and administrative resources, as well as technical, legal, medical and other kinds of information created digitally, or converted into digital form from existing analogue resources. Where resources are “born digital”, there is no other format but the digital object. Digital materials include texts, databases, still and moving images, audio, graphics, software and web pages, among a wide and growing range of formats. They are frequently ephemeral, and require purposeful production, maintenance and management to be retained.”

⁵ *Ibid.*, Article 3.

¹¹ *Charter*, *supra* note 3, Article 12 [emphasis added].

2. The Nature and Sources of Law

What is law? International bodies' aspirational statements about the role of cultural heritage in economic and societal development are calls for immediate action, but they do not have the force of law.¹² Unlike laws, they do not require obedience or penalize disobedience.

International law comprises international conventions, treaties and declarations, but domestic enforceability requires legislation that has been enacted locally by a competent legislature rather than international instruments that have not attained implementation by local legislation. Implementation of international law into the domestic law of Canada generally requires federal, and sometimes provincial, legislation. Implementation of international law can occur in either of two ways: either by enactment of new legislation bringing the treaty into effect or by the presence of existing federal and provincial legislation that is consistent with the new treaty.¹³

Upon ratification of a treaty, Canada becomes bound by it and cannot enact legislation contradicting it.

Even without implementation by domestic legislation, expressions of international values and aspirations are influential with judges and may influence domestic case law, particularly judicial interpretation of domestic legislation.¹⁴

3. Treaties

On the topic of the preservation of digital cultural heritage, the most significant treaty ratified by Canada is the UNESCO *Convention Concerning the Protection of the World Cultural and Natural Heritage*.¹⁵

The Treaty¹⁶ refers to law only twice. First, in Article 5.4, the Treaty¹⁷ refers to law as follows:

Article 5

To ensure that effective and active measures are taken for the protection, conservation and presentation of cultural and natural heritage situated on its territory, each State Party

The Canadian Parliament is presumed not to legislate in breach of a treaty, the comity of nations and the principles of international law: see *Daniels v. White*, [1968] SCR 517, at p 541.]

¹⁵ UNESCO *Convention Concerning the Protection of the World Cultural and Natural Heritage*, 23 July 1976, 1037 UNTS 151, CanTS 1976/44 (entered into force 17 December 1975) [Treaty].

¹⁶ Ibid.

¹⁷ Ibid.

to this Convention shall endeavor, in so far as possible, and as appropriate for each country:...

4. to take the appropriate **legal**, scientific, technical, administrative and financial measures necessary for the identification, protection, conservation, presentation and rehabilitation of this heritage; [emphasis added]

What does UNESCO mean by the phrase, the “appropriate legal measures?”¹⁸ Giving specificity to the phrase, UNESCO refers to a State’s implementation of treaties as legislation protecting treaty rights within the State’s “legal framework,”¹⁹ but does not define the term. The *Charter* also refers to but does not define “legal framework.”²⁰

At its most fundamental level, a State’s legal framework is based on protection of treaty rights by its “constitution.” UNESCO also includes within a State’s legal framework, protection of treaty rights by “a basic legislative text or by any other national provision.”²¹ Incorporation of the UNESCO treaty into “national legislation” also qualifies as a building block within a State’s legal framework.²² Mixing law and administration, UNESCO includes a State’s conferring of authority in relation to treaty rights on a competent authority in the jurisdiction as part of its legal framework.²³

The second reference to law is contained in Article 34 of the Treaty,²⁴ which recognizes that States, such as Canada, having a federal or non-unitary constitutional system divide their legislative powers among legislative bodies and that complete implementation of treaty obligations may also be divisible between legislatures. For example, the Canadian federation divides legislative competence between a Federal Parliament in Ottawa, and provincial and territorial legislative assemblies located within each province or territory. Each of these legislative bodies is sovereign within the legislative powers assigned to it by the Canadian constitution.

Article 34 requires a federal government to implement the convention as far as it is able within its constitutional powers and to inform the other provincial or territorial governments of the treaty obligations within their legislative competence with a recommendation for adoption by their legislatures.

Because the Internet transcends territorial legislative boundaries, it can be important for such purposes as copyright or taxation to identify which level of government can legislate extra-territorially. In Canada, only the federal government can do so, the provinces and territories can impose their legislation only within their respective borders.²⁵

Canada has been a party to other significant treaties on cultural property, however, such as the following:

4. Building the Legal Framework

4.1. The Constitution

Building a legal infrastructure for digitalizing and preserving cultural heritage can start by laying a strong foundation. The foundation of a country’s laws and society is its constitution.²⁶ Therefore, in building a legal framework for the preservation of digital cultural heritage within a State, the starting-point should be consideration of whether or not to reform its constitution. Canada’s constitution comprises statutes and related principles. An important part of the Canadian constitution is a statute entitled, *The Canadian Charter of Rights and Freedoms*,²⁷ which in turn is based on foundational constitutional principles, such as the rule of law²⁸ and respect for the (minority) French language and culture as expressed in sections 16-24, and for multiculturalism as expressed in section 27. Section 27 of the *Canadian Charter of Rights and Freedoms* states as follows:

²⁶ *Citizen’s and The Queen Insurance* (1880), 4 SCR 215; *Re Manitoba Language Rights*, [1985] 1 SCR 721; *Quebec (Attorney General) v Laroche*, 2002 SCC 72, [2002] SCR 708; *British Columbia v Imperial Tobacco Canada Ltd*, 2005 SCC 49, [2005] 2 SCR 473.

²⁷ *Canadian Charter of Rights and Freedoms*, Part 1 of the *Constitution Act*, 1982, being Schedule B to the *Canada Act 1982* (UK), 1982 c 11.

²⁸ *Ibid.*, Preamble to the *Canadian Charter of Rights and Freedoms*.

Multicultural heritage

27. This Charter shall be interpreted in a manner consistent with the preservation and enhancement of the multicultural heritage of Canadians.

Section 27 recognizes the fundamental principle that the heritages of the French, First Nations, Métis and Inuit peoples and other cultural groups are worthy of preservation and enhancement.²⁹ The revised and amended UNESCO *Charter* should define “legal framework” and include a State’s constitution in the definition.

4.2 Legislation: the preferable method of building a legal framework

Domestically, States and their subdivisions are ruled by constitutional laws, legislation and case law. Case law is an important source of domestic law, but court decisions can only effect incremental change in the law through individual cases and cannot establish a comprehensive legal framework for change. For a comprehensive legal solution to a problem such as the preservation of cultural heritage by digital technology, legislation following a review of the legal consequences is the preferred method of achieving meaningful reform.³⁰ The rule of law is satisfied by a basic outline in legislation, with authority to formulate policy delegated to the Executive through the making of regulations pursuant to the statute. This arrangement facilitates responsive rule-making on a rapidly evolving topic such as digital preservation.

Domestic legislation, within limits permitted by the local constitutional law of the jurisdiction, would be necessary to provide a valid and enforceable legal framework for facilitating the long-term preservation of digital heritage. In framing such legislation, a legislature can incorporate concepts developed in international law, foreign law, or case law. The drafters of legislation can borrow legal terms and concepts from anywhere or create their own, as permitted within constitutional limits. Also, proposed legislation should be consistent with other established legislative provisions and case law of the local jurisdiction.

Harmonization of the domestic laws of different jurisdictions is also desirable, to improve efficiency and certainty, in dealing with a common problem such as the preservation of digital heritage. A possible route would be for each jurisdiction, separately and independently, to develop its own domestic legislation dealing with the preservation of its digital heritage. So far, results of this approach are mixed: see the UK’s attempted *Digital Heritage Bill 2010* and Quebec’s *An act respecting the governance and management of information resources of public bodies and government enterprises*.³¹ Turkey’s legislative attempt to protect its cultural heritage, *The Cultural and Natural Heritage Protection Act 2863*, is well-intentioned but has been criticized as unfair to property rights.³²

Online: <http://www.isprs.org/proceedings/XXXVIII/part5/papers/119.pdf>; with Nida Celik and Bayrum Uzun, “Cultural Heritage versus Property Rights” TS09C-Surveying and Cultural Heritage II, 5686; FIG Working Week 2012; Knowing to manage the territory, protect the environment, evaluate the cultural heritage; Rome, Italy, 6-10 May 2012, online: http://www.fig.net/pub/fig2012/papers/ts09c/TS09C_celik_uzun_5686.pdf.

From an international perspective, if each State develops its legislation on its own, the result would be a patchwork of domestic laws at best. Collective effort under the auspices of an international body such as UNESCO might be more effective to harmonize domestic laws. Since 2005, UNESCO has been developing a *Database of National Cultural Heritage Laws*.³³ Proposing model legislation would be a logical next-step for UNESCO to take.

The revised and amended *Charter on the Preservation of Digital Heritage*³⁴ might articulate a broader role for UNESCO than the current Article 12 provides for.

Is it worth considering a role for UNESCO in the development of a model enactment with commentary at the global level? The model provisions would draw upon concepts from local precedents and from the work of others. UNESCO might recommend the model enactment as suitable for adoption by domestic legislatures, with scope for variations as might be considered necessary in each jurisdiction and as described in the commentary to the legislation. The overarching objective of the project would be international harmonization of domestic laws as much as possible. The proposed commentary to the model provisions could contain an informative comparison of the diverse domestic laws on such common issues as authentication of digital records, intellectual property rights, protection of privacy, e-discovery, existing legal duties to preserve digital information and spoliation. Would this be an appropriate and attainable task for UNESCO?

4.3. Suggested topics for additional legal frameworks

For greater certainty, a revised and amended *Charter on the Preservation of Digital Heritage*³⁵ might indicate which topics are significant legal frameworks to improve the preservation and protection of a State's digital heritage. As discussed in the pages that follow, tax reform could create a fiscal framework for donations and other resources to be applied to digital heritage. A framework for copyright law could facilitate digital heritage, too. Finally, the endangered cultural heritage of indigenous peoples should be contained in a legislative framework that is sensitive to the issues.

4.3.1. Funding: tax law reform

The UNESCO *Convention Concerning the Protection of World Cultural and Natural Heritage*,³⁶ Article 5.4, requires States to take appropriate “**financial measures** necessary for the identification, protection, conservation, presentation and rehabilitation of [natural and cultural] heritage.” The *Charter on the Preservation of Digital Heritage*,³⁷ in Article 3, says: “Digital evolution has been too rapid and costly for government and institutions to develop timely and informed preservation strategies.” If the costs of digital protection and preservation of cultural heritage exceed public resources, recourse to private resources is necessary. The *Charter* does not spell this option out clearly: Article 4 merely states: “Member States will benefit by encouraging **legal, economic** and technical measures to safeguard the heritage.”³⁸

³³ UNESCO *Database of National Cultural Heritage Laws*, online: <http://www.unesco.org/culture/natlaws>.

³⁴ *Charter*, *supra* note 3.

³⁵ *Charter*, *supra* note 3.

³⁶ Treaty, *supra* note 15.

³⁷ *Charter*, *supra* note 3.

³⁸ *Ibid.*, (emphasis added).

A revised *Charter on the Preservation of Digital Heritage* could make explicit reference to the need for a legal framework dealing with fiscal incentives to encourage private funding and allocation of other private resources to the protection and preservation of digital cultural heritage. Legislation is necessary to authorize the imposition of taxes, and incentives are commonly introduced to encourage heritage preservation, such as heritage buildings. Projects for the digitalization and preservation of cultural heritage require funding to pay for supplies, equipment and personnel. Though the cost of digital equipment might be falling, other costs rise continually. Government grants can be made available, but current economic realities constrain public funding, necessitating greater recourse to private sources of capital for funding. In a market economy, cultural heritage may not compete favorably for funding against other less risky and more lucrative endeavors. Canadian law currently offers a wide range of exemptions from legal obstacles and provides numerous financial incentives to encourage investing in cultural heritage, because such heritage benefits society.

Canadian courts recognize that technological advances, on balance, are beneficial to society and that the law should encourage their lawful usage.³⁹ Digitalization of cultural heritage increases its availability to the public over the Internet. The resulting efficiencies, cost reductions and expanding accessibility benefit the public. Canadian law regards philanthropic or not-for-profit funding of digitalization and preservation of cultural heritage as charitable. Donations to charitable activities qualify for tax credits. More generous tax incentives could increase the allocation of private resources to these activities.

A revised *Charter* could encourage States to develop a fiscal framework for the protection and preservation of digital cultural heritage through new tax incentives encouraging private investment. The framework should encourage legitimate, good faith preservation, but penalize attempted abuses of the tax incentives.

4.3.2. Intellectual property rights: copyright law reform

Fear of the possible consequences of a copyright violation should not deter digital preservation of imperiled material by public institutions to prevent irretrievable loss of cultural property. Canada proposes to reduce this obstacle to the preservation of endangered material by exempting it from claims of copyright infringement. When implemented, Canada's *Copyright Modernization Bill*⁴⁰ will add an expanded paragraph 30.1(1)© to the *Copyright Act*,⁴¹ stating as follows:

30.1(1) It is not an infringement of copyright for a library, archive or museum or a person acting under the authority of a library, archive or museum to make, for the maintenance or management of its permanent collection or the permanent collection of another library, archive or museum, a copy of a work or other subject-matter, whether published or unpublished, in its permanent collection

...

(c) in an alternative format if the library, archive or museum or a person acting under the authority of the library, archive or museum considers that the original is currently in a format that is obsolete or is becoming obsolete, or that the technology required to use the original is unavailable or is becoming unavailable;

³⁹ *BMG Canada Inc v John Doe*, 2005 FCA 193, [2005] 4 FCR 81 at para 41; *Voltage Pictures LLC v Jane Doe*, 2011 FC 1024 at para 14; *R v Schroeder*, 2012 ABPC 241 at para 24.

⁴⁰ Canada, Bill C-11, *The Copyright Modernization Act*, 1st Sess, 41st Parl, 2011 (assented to 29 July 2012).

⁴¹ *Copyright Act*, RSC 1985, c C-42.

The Bill unfortunately permits copyright holders to over-ride this otherwise laudable provision, among others, with the installation of inviolable digital locks. Despite criticism⁴² of digital locks, the Canadian government persevered with its provisions upholding the primacy of locks.

The problem of “orphan works” obstructs efforts in various States to digitalize vast amounts of cultural heritage and threatens loss of these works to posterity, unless legislation is enacted to resolve the dilemma. When copyright protects a work from use without consent of the current owner, and the owner of the copyright cannot be identified or located to give consent, the work is said to be an “orphan.” In the absence of legislation, usage of the orphan work is frozen.

Section 77 of the Canadian *Copyright Act*⁴³ removes this stumbling block for orphan works covered by Canadian copyright. Basically, the person who wishes to use a work that is subject to Canadian copyright held by someone whose identity or whereabouts cannot be ascertained (called the “unlocatable copyright owner”), may apply to the Copyright Board of Canada for permission to copy the work. If the application is successful, the applicant receives a licence from the Board permitting the proposed use of the work, which prevents the unlocatable owner from suing the applicant for breach of copyright. The Board has a discretion to grant such permission by way of a non-exclusive licence upon being satisfied that the work is subject to a current Canadian copyright and the applicant has made reasonable but unsuccessful efforts to identify and locate the copyright owner. The Board can impose terms and conditions on granting the licence that require the user to pay a (usually) nominal royalty, which the unlocatable owner may claim anytime up to five years after expiry of the licence. In practice, unlocatable owners rarely come forward to claim their modest royalties. The Canadian regime for authorizing usage of orphan works has gained general acceptance in this country, but its adoption by other jurisdictions remains a live issue. The United Kingdom and the European Union are currently in the process of enacting controversial proposals.⁴⁴

Canada’s orphan work provision, section 77 of the *Copyright Act*,⁴⁵ provides as follows:

Section 77 (1) Where on application to the Board by person who wishes to obtain a licence to use

- (a) a published work,
- (b) a fixation of a performance,
- (c) a published sound recording, or
- (d) a fixation of a communication signal

in which a copyright subsists, the Board is satisfied that the applicant has made reasonable efforts to locate the owner of the copyright and that the owner cannot be located, the Board may issue to the applicant a licence...

(2) A licence issued under subsection (1) is non-exclusive and is subject to such terms and conditions as the Board may establish.

(3) The owner of a copyright may, not later than five years after the expiration of a licence issued pursuant to subsection (1) in respect of the copyright, collect the royalties fixed in the licence or, in default of their payment, commence an action to recover them in a court of competent jurisdiction.

⁴² Canadian Library Association, *Call to Action on Copyright: Bill C-11* (January 2012), online: www.CLA.ca.

⁴³ Copyright Act, *supra* note 41.

⁴⁴ UK, Bill 61, *Enterprise and Regulatory Reform Bill*, 2012-2013 sess., 2012; s. 59; EU Directive, *Certain Permitted Uses of Orphan Works*, passed by the European Parliament, 13 September 2012.

⁴⁵ Copyright Act, *supra* note 41.

The revised and amended *Charter on the Preservation of Digital Heritage*⁴⁶ should identify the need for a legislative framework to deal with copyright, and list these two issues, imperiled and orphan works, as primary issues for resolution in the framework. Is there a role for UNESCO in developing optimal legislative solutions to the thorny problems of protecting digital works from loss due to changing technology and overcoming copyright obstacles concerning orphan works?

4.3.3. Digitizing and Preserving the Cultural Heritage of Indigenous Peoples

The United Nations *Declaration on the Rights of Indigenous Peoples*⁴⁷ contains many references to States' responsibilities in protecting and preserving the cultural heritage of indigenous peoples. Article 31 of the *Declaration*⁴⁸ is especially pertinent, stating as follows:

Article 31

1. Indigenous peoples have the right to maintain, control, protect and develop their cultural heritage, traditional knowledge and traditional cultural expressions, as well as the manifestations of their sciences, technologies and cultures, including human and genetic resources, seeds, medicines, knowledge of the properties of fauna and flora, oral traditions, literatures, designs, sports and traditional games and visual and performing arts. They also have the right to maintain, control, protect and develop their intellectual property over such cultural heritage, traditional knowledge, and traditional cultural expressions.

2. In conjunction with indigenous peoples, States shall take effective measures to recognize and protect the exercise of these rights.

After initially opposing the *Declaration on Indigenous Peoples*, Canada reversed its position and approved of it, as an aspirational statement.⁴⁹ The revised and amended *Charter on the Preservation of Digital Heritage* might make specific reference to development of a legal framework relating to the digital preservation of the cultural heritage of indigenous peoples, as especially significant. Consistently with Article 31, Canadian courts recognize the cultural significance of Aboriginal rights over their heritage.⁵⁰

4.3.4. Enforcement by States of Treaty Obligations and Other Responsibilities in the Digital Era

In recent decades the volume of illicit trade in cultural objects has grown spectacularly and beyond traditional legal control. To counteract this abuse, UNESCO recommends⁵¹ that States should

⁵¹ UNESCO, *Illicit Traffic of Cultural Property*, online: <http://www.unesco.org/new/en/culture/themes/movable-heritage-and-museums/illicit-traffic-of-cultural-property/>.

immediately ratify and implement the 1970 *UNESCO Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of Cultural Property*.⁵² The prevalence of E-commerce poses challenges to the regulation of international transactions in cultural heritage property. Transactions by email or through websites transcend geographical borders and do not occur in places known to traditional law.

Following the definitions in international law, Canadian export/import controls on cultural heritage property apply only to certain types of tangible movable cultural property.⁵³ E-commerce threatens to put electronic trade in cultural heritage property beyond the practical reach of domestic law. The Internet “exists” in cyberspace, transcending national boundaries, yet laws are usually territorial rather than international. This geographical limitation challenges the effectiveness of attempting to regulate transactions over the Internet by domestic law.⁵⁴ UNESCO seeks to avoid such impracticalities by taking a broader approach, to the effect that “all countries should attempt to respond to the illicit trade in cultural objects via the Internet by taking appropriate measures,” and offers practical suggestions for trade barriers to impede illicit Internet dealings.⁵⁵ Domestic laws can help to regulate the sale and export of culturally significant materials by requiring export permits and conferring pre-emptive rights of first refusal on local purchasers, prior to export. Should a revised and amended *Charter on the Preservation of Digital Heritage*⁵⁶ offer guidance to States on a model legal framework for enforcement?

5. Conclusion

A global approach to building domestic legal frameworks for the preservation of digital heritage is attainable with the active involvement of UNESCO and preferable to individual States proceeding on their own. UNESCO should review its instruments and increase its activities to facilitate this most worthwhile but complex of human endeavors.

Development of Policies and Requirements for Ingesting and Preserving Digital Records Into a Preservation System

Where to start?

Alicia Barnard

Abstract

In the light of the new Records/Archives Law in Mexico, it is mandatory to issue requirements and processes for agencies recordkeeping systems as well as for the development a digital repository for long-term preservation. For that there are already models, standards and basic requirements, widely accepted that may be reviewed and adapted for our environment. Moreover, good practices for digital records preservation require giving special attention to digital records appraisal activities. Thus, in order make recommendations for digital records appraisal policies for federal agencies, selected documents from national archives as well as research projects are being reviewed.

Author

Alicia Barnard is currently an independent records manager consultant. From 1990 to 2008, she was director of the Documentation Centre in the Mexican Federal Ministry of Health. In 1992, she received an “Archival Merit Diploma” and in 2000 “Acknowledgment to the Records and archival Tasks Diploma” from the General Archive of the Nation. From September 2005 to March 2006 she was a member of the CLAID Team funded by UNESCO to receive training on electronic records preservation within the InterPARES 2 Project. She was director of TEAM Mexico of the InterPARES 3 Project until spring 2008 and co-researcher until May 2012. She has published and presented widely on digital records management and preservation.

1. Introduction

Before the recent Federal Law of Records/Archives in Mexico last issued last January,¹ digital records were still not an issue to be taken into account. Although there were some unclear general guidelines for the Federal Government, record managers and archivists were and are indeed worried about this kind of records. One may say that until now information technology areas (IT) are ruling how the information is managed within Federal Agencies without any records/archival practices, although all information systems create, maintain and preserve information that comply or function as records since they are created as an instrument or by-product of an activity or as a reference, are unique, and have archival bond that relates with others of the same aggregation. Right now when we are about to have a new Administration nobody knows for sure how digital records from the current Administration are being delivered to the next one, or how are they kept or disposed of, or if there is enough information to assure that the systems where the information resides are trustworthy. Although computer safety regulations help the maintenance of information systems, we are aware that they complement records/archival practices, but it is not enough since nobody knows how data maintained in information systems is being disposed, or if said data is kept without any reason to do so, or if it is already compromised because of migration or other changes (technological, administrative or juridical) that might impact on its authenticity and accessibility.

¹ <http://www.diputados.gob.mx/LeyesBiblio/pdf/LFA.pdf> (Accessed August 28, 2012).

Well of the evils, the lesser. The above mentioned Federal of Records/Archives Law sets for the first time regulations for digital records, it stipulates that processes and technical tools are equivalent for both paper and electronic records, among them there are: capture (creation/integration), monitoring (tracking), use, creation of functional classification schemas, file integration, description (section, series, files), transference (disposal rules), maintenance, information access and personal data controls, appraisal and audit. Besides the Law disposes that guidelines for recordkeeping systems must be issued which should consider: a) To keep and preserve metadata created for the development of such recordkeeping systems; b) To include rules and measures to guarantee authenticity, security, integrity and availability of electronic records as well as those devoted to their management and control; c) to develop procedures to document updating, backing, migration, or other processes that affect the authenticity of electronic records as well as those juridical-administrative and technological changes in systems, software or devices and hardware that may also impact on the electronic records content.

Fortunately the Law dispositions have not forgotten digital records preservation, either for the creator's usability or for the historical and social values, the Law disposes that institutions must have a preservation system according to the specifications to be issued.

On these order of ideas, in addition to basic functionalities for a recordkeeping systems for agencies, in relation with records, National General Archives (NGA) must develop a digital repository together with policies, rules, guidelines or procedures related to appraisal and transference of records with values to be considered as heritage of our Nation.

As for a recordkeeping system there are already models, functionalities, requirements that are being analysed in order to adapt which is best for agencies. Those rules as well as the guidelines are being elaborated. Firstly, for next January the rules derived from the Law will be published as well as the basic policies and requirements for a recordkeeping system. In this task it was decided to select minimum requisites and review the further on them according to the experiences obtained in their instrumentation.

With respect to the transference/ingesting and preserving records to a digital repository, the OAIS model² already offers the main elements for transference/ingesting digital data. The model, provides with elements to consider for this process such as: agreements between the creator and the preserver in relation with the type of information to be transferred, formats, means of transmission and periodicity as well as the requirements to be established by the repository regarding the type of information that will keep and maintain, the kind of metadata needed, intellectual rights to be acquired, and so on. There are also criteria for digital records repositories certification.³ It is not the same with the appraisal process, there is not a single model or methodology to do so, but is also a fact that appraisal⁴ cannot be anymore carried without

(2007). Version 1.0, http://www.crl.edu/sites/default/files/attachments/pages/trac_0.pdf (Accessed August 28, 2012); And also: International Standards Organization: ISO 16363:2012: Space data and information transfer systems -- Audit and certification of trustworthy digital repositories, http://www.iso.org/iso/iso_catalogue/catalogue_tc/catalogue_detail.htm?csnumber=56510 (Accessed August 28, 2012).

⁴ The definition of appraisal for this paper is the one of the InterPARES Glossary: "The process of assessing the value of records for the purpose of determining the length and conditions of their preservation," http://www.interpares.org/ip2/display_file.cfm?doc=ip2_glossary.pdf&CFID=2004855&CFTOKEN=47951380 (Accessed August 28, 2012).

specific policies methodologies or guidelines they are essential if we really want to maintain for future generations our heritage materials available.

Currently, for paper records Federal agencies, most of the states and local agencies already use functional classification schemas linked to disposition schedules, although it is perceived that these instruments are not always good or applied correctly, so first they must be reviewed for its application within a digital environment. As for an appraisal methodology GAN, as the agency responsible of authorizing records destruction or transference issued a reference guide for identifying paper records series with secondary value,⁵ it recommends agencies to carry out record series appraisal during the first and second phase of the life cycle, first for a quality study of the records series and a second appraisal for comparing other similar series created by other institutions, besides the guide offers certain general topics as well of a checklist that will lead to an approximate of certain documents with secondary values. GAN has also issued basic requirements for the transference of paper records to be preserved for the long-term. Notwithstanding there is still lack of a policies, guidelines or practices for appraising digital records.

The purpose of this study is to offer an approach of certain factors and recommendations to be taken into account for the development of appraisal policies in Mexico. It is based on the review of the main digital records appraisal policies or rules issued of the National Archives of Canada, United States, United Kingdom and New Zealand published in their official websites. Besides the InterPARES project materials related to appraisal will be taken into account, as well as the results of the recent conclusions obtained by the Digital Records Appraisal Group of the Latin American (including Spain) Records Appraisal Project (FIED).⁶ First, a synthesis of the documents reviewed is presented followed by an approach of what appraisal policies or guidelines in Mexico should consider.

2.1 National Library and Archives of Canada (LAC)

Document: Appraisal Methodology: Macro-Appraisal and Functional Analysis. Part B: Guidelines for Performing an Archival Appraisal of Government Records. 2000 reviewed on 2005⁷

Purpose:

The guidelines proposed are based on the Macro-Appraisal approach by means of functional analysis to get information about the environment where information is recorded such as its nature, structure, creation process and especially interrelationships with other information/records creators and users. The guidelines also considers at the end micro-appraisal to identify factors such as completeness and comprehensiveness, authenticity, uniqueness, relationship to other records, date and time span, extent,

⁵ Archivo General de la Nación (2009): Guía para la identificación de series documentales con valor secundario, <http://www.agn.gob.mx/menuprincipal/archivistica/pdf/GuiaIdentificacion21052012.pdf> (Accessed August 28, 2012).

⁶ The Digital Records Appraisal Group of the Latin American and Spanish Records Appraisal Project was partially funded from 2009 to 2012 by the International Council of Archives. The professors and practitioners that participated were from Argentina, Brazil, Colombia, Spain, Costa Rica, Mexico, Peru and Uruguay. There were different groups for specific topics related to appraisal, such as terminology, educational programs, sampling, methodologies and specific issues on digital records. Particularly, this last group was coordinated by Lluís-Esteban Casellas (in 2011) and Alicia Barnard (in 2010-2012) and integrated by Ma. Teresa Bermudez, Aida Cristina Oliveira, Andrés Pak Linares and Aída Luz Mendoza Navarro, <http://blogs.ffyh.unc.edu.ar/evaluaciondedocumentos/category/mariela-alejandra-contreras-argentina/> (Accessed August 28, 2012).

⁷ <http://www.collectionscanada.gc.ca/government/disposition/007007-1041-e.html>.

usability, physical condition. The guidelines were designed for both paper and digital records. Particularly, in relation with electronic data of program delivery or analysis systems, the guidelines recommend archivists to carry out:

Investigation of micro-data as well as longitudinal data-files built from said micro-data in order to (recognize or) confirm the role of regional and field data systems and their relationship with data sharing with superior systems.

2.2 National Archives and Records Management Administration (NARA) of the United States

Document: Appraisal Policy. September 2007⁸

Purpose:

The policy sets out the strategic framework, objectives, and guidelines that the National Archives and Records Administration (NARA) use to determine whether Federal records both, traditional and digital, have archival value. It establishes which are permanent records categories as well as specific guidelines for appraising certain categories of records.

The policy states that the authority for retention and disposition of the Federal Records is the National Archivist, although it also establishes that the process is carried out with interested parties and considers the point of view of the records creators. Besides the policy includes appendixes for special considerations such as the usability of electronic records that might require specific measures due to their technological capabilities in contrast with other records that are easy to maintain. There are also special considerations for certain types of records as observational data, environmental health and safety records or research and development records; said considerations are mainly directed to digital records.

2.3 The National Archives (TNA), United Kingdom.

Document: The National Archives Appraisal Policy (last updated August, 2004)⁹

Purposes:

- To develop a system of appraisal applicable to new environments created by digital records
- To ensure the continued transfer of paper records to TNA for at least the next 20 years.
- To ensure that appraisal for archival purposes selects records of highest archival value avoiding duplication.
- To provide appraisal methods for both digital and paper records as well as records created in any other medium.
- The policy states that an effective appraisal, mainly in the digital environment depends on good systems of records creation and business scheduling records.

⁸ <http://www.archives.gov/records-mgmt/initiatives/appraisal.html> (Accessed August 28, 2012).

⁹ http://www.nationalarchives.gov.uk/documents/information-management/appraisal_policy.pdf (Accessed August 28, 2012).

The policy was developed to deal with digital records, it admits that the traditional Grigg System issued in 1958 proved its effectiveness for paper records although specific changes should be made for appraising digital records. It states that an effective appraisal, mainly in the digital environment, depends on good systems of records creation and business scheduling records. Moreover, the policy considers macro-appraisal appropriate for digital records as an initial guide to identify public records of value for business and archival purposes, in order to understand the functions that create them. Also, it considers macro-appraisal as an aid to identify those records with potential archival value in file plans, as well as datasets and case files that overlap between departments. It also includes the need for developing generic archival appraisal guide for categories of records such as those produced by similar types of departments.

In relation with appraisal TNA has developed a various documents that help agencies with the process such as the Appraisal Report Template, General Guidelines for the Selection of Records, How to compile an appraisal report, Series level appraisal questionnaire.¹⁰

2.4 New Zealand Archives

Document: Appraisal Policy, September 2008¹¹

Purpose:

To support the Chief Archivist's decision making around appraisal of government records for the purposes of disposal.

The Policy briefly explains why appraisal is needed in context of government and local agencies and the purposes for determining which records are public. Also includes principles for good records practices to support appraisal decision making such as lawfulness, accountability and transparency, consistency and resources that should be taken into consideration together with the point of view of creators. Also, the policy establishes certain objectives that help to identify the archival significance of records and the responsibilities of the process for producers and preservers. The policy applies for any public record (electronic, paper or other) as stated in the Public Records Act.¹²

3. Main conclusions encountered in the documents reviewed

- Most Archival Institutions do have an appraisal policy.
- The policy main purpose is to support the National Archivist for disposition decision making actions.
- Policies also guide creators to identify records that should be preserved because of their values.
- Policies are focused on both traditional (paper, film, etc) and digital records.
- There are checklists to help the creator to identify those records with permanent values, as well as special considerations for scientific data, environmental data, etc.

¹⁰ <http://www.nationalarchives.gov.uk/information-management/guidance/a.htm> (Accessed August 28, 2012).

¹¹ http://archives.govt.nz/sites/default/files/appraisal_policy_0.pdf (Accessed August 28, 2012).

¹² <http://www.legislation.govt.nz/act/public/2005/0040/latest/DLM345537.html> (Accessed August 28, 2012).

- There are recommendations for macro-appraisal or functional appraisal although down to top appraisal is not left out.
- The main reason of an appraisal policy was for better appraisal practices regarding digital records and considers that an effective appraisal is supported by good systems of records creation and scheduling records.
- Recognition of the role of regional and field data systems and their relationship with data sharing with superior systems .
- The issuing guides for categories of records such as those produced by similar types of departments.

By reviewing the InterPARES Project proposals for appraisal there are four main issues to take into consideration for digital records appraisal.¹³

1. To carry out appraisal at the beginning of the life cycle or when designing the recordkeeping systems.
2. Assess and document authenticity. Digital records intangibility as well as technological obsolescence or its transmission in time and space are undoubtedly factors that compromise their authenticity. Therefore, assessment to identify elements related to its integrity (persons, dates, archival bond) and integrity (completeness and uniqueness) of records or the recordkeeping system where they reside must be carried out. Although one must accept that digital records of the creator are authentic unless the contrary is proved, we must trust on our digital heritage to be authentic and reliable for its preservation.
3. Determining feasibility of preservation. By identifying technical requirements for preservation, formats, as well as digital components such as metadata, content and context information will help the institution that is going to preserve the records for the long-term to understand costs of acquisition, taking into account that most of them are constant. There may be records that are developed in complex systems that might require either to postpone its transference in order to look for more resources or alliance with other institutions.
4. Monitoring appraised records. Those records already appraised for is long-term preservation require to be monitored and reappraised before they are transferred to an archive for preservation, in order to assess if the initial appraisal decision has not changed or if there is no damage in records and its components when there are changes or redesign of the recordkeeping system, or in functions within the organization, or in the status of the records information.

The InterPARES 3 Project with support of the International Council of Archives recently issued the series *Digital Records Pathways: Topics in Digital Preservation*.¹⁴ The series includes a module devoted to

¹³ Hackett, Yvette, Domain 3 Task Force, "Appendix 21: Preserver Guidelines – Preserving Digital Records: Guidelines for Organizations," [electronic version] in *International Research on Permanent Authentic Records in Electronic Systems (InterPARES) 2: Experiential, Interactive and Dynamic Records*, ed. Luciana Duranti and Randy Preston (Padova, Italy: Associazione Nazionale Archivistica Italiana, 2008).

appraisal which reasserts that “principles for appraisal and preservation decisions should be embedded in all record-creating and recordkeeping activities.” The module proposes the following steps for conducting appraisal which is based on the above mentioned issues.

- **Compiling information.** This activity includes gathering contextual information of the record’s corpus to be appraised (juridical-administrative, provenancial, procedural and technological).
- **Assessing value.** The continuing value either for the creator due to legal, evidentiary or business reasons, or for cultural, historical and research purposes could be assessed either by top-down in terms of the records contexts or a bottom up approach by assessing their values.
- **Assess and document authenticity.** The InterPARES *Requirements for Assessing and Maintaining the Authenticity*¹⁵ was designed for this purpose in order to either establish if records may be ingested for preservation or if it is needed to carry out risk assessment when authenticity is compromised.
- **Determining the feasibility of preservation.** This activity implies to identify records elements to be preserved according to the system design and configuration, records elements that may be manifested in digital components in various ways (content, metadata and creation contexts). This will help to know about the system, the essential records manifestations, its metadata and context creation that will help to reconcile preservation requirements with preservation capabilities by assessing the institutions current and future preservation capabilities such as professional knowledge, expertise as well as IT infrastructure and financial resources.
- **Monitoring appraised digital records.** Once the appraisal decision has been taken, records that are going to be preserved for the long-term require to be monitored while they reside in the recordkeeping system of the creator in order to verify if the initial appraisal decision is still valid and terms and conditions of transfer or require a new appraisal process.

The Digital Records Appraisal group of the Latin-American (including Spain) Evaluation Project (FIED) focused its research on appraisal documents issued by different national archives as well as on international research projects or institutions, some of which were also reviewed for this study case.¹⁶ The main conclusions were:

- Appraisal as an intellectual activity is the same for any media.
- Appraisal must be carried out at the beginning of the lifecycle when records are controlled by a recordkeeping system

¹⁴ The InterPARES 3 Project, *Education Modules - Digital Records Pathways: Topics in Digital Preservation*, http://www.interpares.org/ip3/display_file.cfm?doc=Education-Modules_Digital-Records-Pathways.zip (Accessed August 28, 2012).

¹⁵ InterPARES: Authenticity Task Force (2002), “Appendix 2: Requirements for Assessing and Maintaining the Authenticity of Electronic Records” in *The Long-term Preservation of Authentic Electronic Records: Findings of the InterPARES Project*, ed. Luciana Duranti (San Miniato, Italy: Archilab, 2005), 204–219. Online reprint available at http://www.interpares.org/book/interpares_book_k_app02.pdf.

¹⁶ The digital records appraisal group besides reviewed information from the website of the National Archives of Australia, the InterPARES Project also reviewed official websites of the Digital Curation Centre, Digital Preservation Europe, Inter-University Consortium for Political and Social Research, the UK Data Archive as well as the National Archives of Australia.

- Digital records appraisal cannot be dependent on technological factors, considerations on processes and contexts that impact the creation of digital records must be taken into account.
- Professional education, knowledge of the records environment and research are basic elements for good appraisal policy.

I would also like to mention the InterPARES Project Director Dr. Luciana Duranti's conclusions for digital records appraisal:¹⁷

- *Appraisal, different from selection, is entirely conditioned by the specific context.*
- *It requires a clear relationship between the creator and the designated preserver.*
- *Selection and appraisal must be based on trust.*
- *Appraisal must be clearly motivated on the basis of arguments that are not only being archival/diplomatic and technological, but also legal, ethical, and financial.*
- *The archivist must be all to all records, including the potential records that s/he should contribute to design.*
- *Appraisal must be carried out as soon as possible after creation.*
- *Appraisal must consider functions, records, systems.*
- *Appraisal must be carried out by a team of records professionals, legal, and financial experts, and IT professionals.*
- *Appraisal would serve the creator, researchers and society at large.*
- *Appraisal should be carried out in the environment in which they reside at any given time.*
- *Appraisal should be carried out every time the system's creator is upgraded or changed. Once the records are acquired the selection process and the appraisal is definitive.*

Thus, the Digital Appraisal Group of FIED developed the following recommendations when designing appraisal policies:

- To develop and implement classification schemas, records schedule plans, migration, refreshment and updating procedures before transferring records to a digital repository for its preservation. This in order to assure integrity, reliability and usability of digital records.
- To take into consideration problems associated with records hosted outside the servers and to establish the development of recommendations in this respect.
- To elaborate guidelines for metadata retention regarding the appraisal decision and its link to the record during the retention period, as well as for protection against unauthorized disposition.
- To establish monitoring strategies to identify juridical-administrative, provenancial, procedural and technological changes of those records already appraised for its preservation.
- To consider that information creator systems must comply with recordkeeping procedures and processes in order to identify and establish retention periods, to provide periodical information related with the systems updates or changes, transfer or destruction activities according to schedule plans, and documentation related to the system functionalities

¹⁷ Duranti, Luciana, keynote address, "The Appraisal of Digital Records: The Return of Diplomats as a Forensic Discipline," International Conference on "The E-Discovery Challenge: Digital Wasteland or Digital Oasis. An Interdisciplinary Approach to Managing Records – Archives, Law and Evidence," 3-4 November 2010. Singapore, Singapore, http://www.interpares.org/display_file.cfm?doc=ip3_canada_dissemination_cs_duranti_singapore_2010a.pdf.

- To consider the elaboration of guidelines for the control and elimination of records produced or included in websites, and when necessary, to adapt schedules plan in order to include series created for the website when these are not already considered.
- To consider appraisal of information as by product of scientific data analysis models.

Besides, the Digital Appraisal Group established certain requisites and issues to consider when appraising digital records.

The information gathered lead to conclude that there is enough information for designing a general appraisal policy with special attention to digital records which deserve utmost attention due to the constant risk they face because of the technological environment that compromises their authenticity, thus severely questioning if they are trustworthy for the their preservation. Thus the following topics are of relevance to be considered.

- The role and responsibilities of creator and preserver for the appraisal process.
- The statement of the main governmental, cultural, historical and societal reasons for continued preservation.
- Check lists that may help the creator in the decision making process.
- The appraisal process must be carried out at the beginning of the life cycle or when designing the recordkeeping system for both digital and paper records.
- The development of specific policies, guidelines or procedures:
 - For carrying out the appraisal process. These will make distinction of traditional records (paper or other) and digital ones.
 - For specific disposition criteria in relation with generic series that are created and maintained in different agencies mainly for those created and maintained in digital environments.

Particularly, the appraisal policy must consider the following topics for digital records.

- Functional appraisal methodology as an initial approach although down-top appraisal should not be ignored.
- The main activities to carry out digital appraisal, such as:
 - Assessment and documentation of authenticity.
 - Identification of digital components of records (content, metadata and contextual information).
 - Determining feasibility of preservation.
 - Monitoring records already appraised.
 - Developing transfer-ingest plans.
- Development of risk analysis strategies or diplomatic analysis when it is presumed that records have high secondary values but authenticity is compromised because of the lack of structural or formal components or because they are not captured in a recordkeeping system.
- Appraisal carried out by multidisciplinary groups, based on local and national regulations.

Notwithstanding, the availability of policies, methodologies, procedures or requirements to be adapted or adopted for a good appraisal, as the main step to continued preservation of high value records, our digital heritage in Mexico will remain in danger if authorities of the highest level forget that archival/diplomatic practices are urgently needed to create, maintain and preserve digital records. Also it is important for the authorities to recognize that the challenge for preserving digital records is not anymore an isolated task carried out by records managers or archivists they should be accompanied by other professionals since the best solutions are multidisciplinary shared by creators, records managers and preservers and other stockholders. In these tasks IT also plays an important role, but not the only one as it is still perceived by authorities in Mexico.

Where Light in Darkness Lies

*Preservation, Access and Sensemaking Strategies for the Modern Digital Archive*¹

Jason R. Baron¹ and Simon J. Attfield²

¹US National Archives and Records Administration; ²Interaction Design Centre, Middlesex University, USA

Abstract

The second decade of the 21st century finds institutions around the world increasingly having to cope with the matter of how to preserve electronic records in response to litigation, regulatory and compliance demands. In the public sector, existing approaches to email preservation in particular (based on past litigation) run the gamut from continued reliance on print to paper strategies; to deployment of disaster recovery backup tapes as default recordkeeping systems; to forms of electronic recordkeeping that continue to rely on end users performing records management functions; and most recently, to automated email archiving. This paper argues that with greater encouragement and adoption of automated capture methods, archivists and historians should understand both the limitations of present-day search techniques, as well as the need to extract “meaning” out of what are increasingly vast amounts of electronic records, especially through consideration of new methods drawn from the disciplines of sensemaking and visual analytics.

Authors

Jason R. Baron serves as Director of Litigation for the US National Archives and Records Administration, and is an Adjunct Faculty Member at the University of Maryland, College of Information Studies. Mr. Baron formerly held the positions of trial attorney and senior counsel in the U.S. Department of Justice. He has also served as a Visiting Scholar at the University of British Columbia, participated in InterPARES, and co-founded the US NIST TREC Legal Track. He is a recipient of the Emmett Leahy Award, recognizing his career contributions in the field of records and information management. Mr. Baron received his degrees from Wesleyan University and the Boston University School of Law.

Simon Attfield is a Senior Lecturer in the Interaction Design Centre, Middlesex University, UK. His research lies in the area of understanding how people work with information, processes involved in individual and collaborative sensemaking and implications for interactive systems design. With Ann Blandford he is co-author of the book *Interacting with Information*, part of the Morgan Claypool series of Synthesis Lectures on Human-Centered Informatics. He received a B.A. in Philosophy and a BSc. in Experimental Psychology from Sussex University, and a Ph.D. in Human Computer Interaction from University College London.

1. Introduction

During the past 20 years, with the growth of computer networks and interconnectivity in the workplace,² email has become a worldwide phenomenon, transforming the lives of individual employees. The

¹ This article represents a reworking of themes and materials presented at the 8th European Digital Preservation Conference (ECA 2010) in Geneva, at I-CHORA 5 (2010) in London, as well as the DELOS conference (2007) in Rome. The authors wish to thank Richard Cox, Richard Pearce-Moses, Mary Jo Pugh, and Gary M. Stern for their comments on prior drafts, as well as Luciana Duranti for her overall support. The views expressed here are solely the authors, however, and do not purport to represent the official position of any institution with which they are affiliated.

replacement of secretaries with personal computers has, for better or worse, turned each office worker into a *de facto* record keeper in public bureaucracies, and to a lesser extent, in private firms and corporations as well. Now, at the start of the second decade of the 21st century, public and private institutions around the world are increasingly coping with the consequence of having empowered all staff with email as a communications tool, viewing email as a corporate necessity. Paradoxically, *de facto* - modern email archives remain a major source of risk, given the minefield represented by modern day litigation, investigations, compliance and regulatory measures, all in search of evidence in the form of a candid “smoking gun.” And yet, the email universe continues to expand exponentially, giving rise not only to short term information governance challenges, but also profound issues regarding access to the contents of those communications—including the desire to find relevant messages as well as in making sense of the collection as a whole.

Public sector institutions have deployed variety of policy and technology solutions as “preservation” policies: continued reliance on print to paper strategies; deployment of disaster recovery backup tapes as default recordkeeping systems; electronic recordkeeping that relies on end-users to “tag, drag and drop” individual email communications into an archive; and most recently, tentative adoption of automated capture methods known as “email archiving.” All these technological solutions, other than “print to paper,” more or less rely on automated searching to provide access to email archives in their electronic form. By now, however, well-established limitations on the efficacy of keyword searching leave open for resolution how best alternative strategies may be employed for extracting “meaning” from vast amounts of email, i.e., how to perform information retrieval to extract the “needles” of meaning from the ever growing e-haystack.³

There is, however, a fundamental “records management” reality that needs to be confronted and overcome. Even two decades into the deployment of email, and even in the highly networked world we find ourselves in, the reality of the “end user’s” experience in managing and preserving electronic records has not fundamentally changed. In particular, in the United States at present, only a few public sector institutions have instituted successful, comprehensive, enterprise-wide electronic content management, even in the face of sustained criticism that the state of records management in the federal sector in the U.S. approaches “chaos.”⁴ Change is now in the air, however, as most notably evidenced in new records management mandates from President Obama and U.S. Archivist David Ferriero.

2. A New Day for Managing Public Sector Email & A Challenge

On November 28, 2011, President Obama issued a memorandum on Managing Government Records for the heads of all Executive branch agencies in the U.S., stating that he was beginning a government-wide “effort to reform records management practices.”⁵ He recognized that:

Decades of technological advances have transformed agency operations, creating challenges and opportunities for agency records management. Greater reliance on electronic communication and systems has radically increased the volume and diversity of information that agencies must manage. With proper planning, technology can make these records less burdensome to manage and easier to use and share. But if records management policies and practices are not updated for a digital age, the surge in information could overwhelm agency systems, leading to higher costs and lost records.

In stating that “proper records management is the backbone of open government,”⁶ the President directed that the Archivist of the United States, working with other senior officials, develop a Records Management Directive (“Directive”) that addresses modern day records challenges, including with respect to email, social media, and cloud based data sets.

On August 24, 2012, the Archivist of the United States issued the planned for Directive, a document that represents an inflection point in the history of archival institutions worldwide. The Directive boldly sets out that by 2019 all permanent electronic records of the U.S. Government are to be managed and preserved in electronic form, for eventual transfer and accessioning at the National Archives and Records Administration (“NARA”).⁷ As a corollary, the Archivist also directed that *all* email records (both permanent and temporary in nature), be managed in an accessible electronic format by the end of 2016. Specifically with respect to email, the Directive goes on to say:

Email records must be retained in an appropriate electronic system that supports records management and litigation requirements (which may include preservation-in-place models), including the capability to identify, retrieve, and retain records for as long as they are needed.⁸

The Directive separately calls for NARA and others to work with private industry “to produce economically viable automated records management solutions,” including “advanced search techniques,”⁹ and to “embed records management requirements into cloud architectures.”¹⁰ These promising mandates at long last give a much needed impetus to finding satisfactory electronic archiving solutions for email and other forms of electronic records. They represent a profound commitment to true digital government: that what is born digital should be preserved digitally, at least insofar as the data, information and records represent what is deemed appropriate to permanently preserve the memory of the 21st century.

But these aspects of the Archivist’s directives represent a challenge to archivists, as well as to all those seeking access to archives (including lawyers, historians, and researchers)—given the new reality that we are living in a world of vast public sector digital archives that are expected to be sustained on an

⁷ Id., Part I, § 1.1.

⁸ Id., § 1.2.

⁹ Id., Part II, § A3.

¹⁰ Id., § A4.

indefinite basis into the long-term future. Compliance with the new Directive requires the management and ultimately long-term preservation of permanent record emails in digital form. Given this mandate, archivists in public sector institutions such as NARA also have a responsibility to be good stewards of these growing digital archives in providing access. Thus, beyond resolving difficult preservation issues, greater attention also needs be paid to the conduct of search and sensemaking within these large digital collections, for purposes of best ensuring or optimizing future access as expeditiously as possible, within the constraints of the law, for the benefit of future generations.

In the United States, due to litigation involving White House email that began on the last day of the Administration in Ronald Reagan (in January 1989), presidential records in the form of email are deemed permanent public records and have been preserved.¹¹ By 2017 there may be as many as one billion White House emails cumulatively in the legal custody of the Archives.¹² The White House email archiving experience against the backdrop of continuing litigation lasting over two decades amounts to a tale both fascinating and cautionary, with a mixed bag of lessons.¹³ That this archive has been continuously maintained over two decades, across a variety of proprietary platforms—with whatever their admitted defects—serves to indicate that automated solutions to email archiving are indeed feasible.

Yet, paradoxically, with limited exceptions all email that has come into the National Archives to date remains behind closed doors, essentially locked away in the digital dark. Litigation and Freedom of Information Act requests provide limited forays into these dark places, but they do not represent the kind of systematic review that is needed to open these archival collections in a logical way. NARA's presidential libraries are overwhelmed with lengthening access queues due to both litigation and filings under the Freedom of Information Act. However, because the collections do contain sensitive and privileged information—everything from social security numbers to medical conditions to prior criminal records and the like—they cannot easily be made open to the public without further archival processing. This in turn means that large segments of these email repositories exist as *de facto* digital dark archives, awaiting future systematic opening in whole or in part determined by the longest period covered by existing federal privacy laws and practices. Under such circumstances, the default condition on these archives is that they will not become open to the public until 75 or more years after the end of the current Administration.¹⁴

Ambacher (Lanham, MD and Oxford: The Scarecrow Press 2003), chap. 6; David Bearman, "The Implications of *Armstrong v. Executive Office of the President* for the Archival Management of Electronic Records," *American Archivist* 56, no. 4 (1993): 674-89; GAO Report 01-446, "Clinton Administration's Management of Executive Office of the President's E-mail System (April 2001), <http://www.gao.gov/products/GAO-01-446>; Citizens for Responsibility and Ethics in Washington, "The Untold Story of the Bush White House E-mails," (August 2010), <http://citizensforethics.org/bush-white-house-ignored-warnings-about-email>; Myron Groover, "The White House E-Mail Destruction Scandal of 2007: A Case Study for Digital Heritage" (paper presented at the UNESCO Conference: The Memory of the World in the Digital Age, Vancouver, B.C., 2012).

¹⁴ See: NARA regulations at 36 C.F.R. 1256.56(a)(2) (2012) (NARA policy potentially restricts information in personnel, medical or other records revealing information of a highly personal nature regarding living individuals that inter alia "relates to events less than 75 years old.").

In light of all of the above, a commitment to sustainable digital archives necessitates a parallel commitment to new ways of thinking: first, about the burden on end-users in performing records management; second, about the need for automating the segregation or classification of permanent records apart from the disposable or transitory, and third, about the opportunity to use advanced search techniques to extract meaning and make sense of the coming vast digital collections.

3. Past Failed Approaches to Email Management

We first need to declare an end to the era of end-users assuming the burden of records management. Since the late 1980s, with the universal rollout of PCs in offices and at personal workstations, all end-users have become *de facto* records managers, which may have been theoretically achievable in a world of word processing, spreadsheets, and the *occasional* email of substantive importance. However, the reality of the present day workplace is vastly different: each end user is drowning in information, only a portion of which in the public sector constitute long-term temporary or permanent records.

Except in certain exotic and rarified environments, print-to-paper appears to be an utterly failed recordkeeping paradigm. Substantial rates of individual end-user noncompliance with retention policies calling for the printing out of email are the norm in any organization that will admit to such in a survey (or under oath). The U.S. Government Accountability Office reported in 2008 on a small survey of 15 senior officials at various federal agencies, eight of whom “did not consistently conform to key requirements in NARA’s regulations for email records, such as filing them in appropriate recordkeeping systems.”¹⁵ The simple truth: with rare exception, for the past twenty years, few professionals (and even fewer lawyers) consistently or comprehensively have printed out all emails of record for placement in traditional office filing systems.

But other more digital-centric recordkeeping approaches that nevertheless rely on end-users have similarly met with less than success. Strategies that rely on ad hoc actions on the part of individual end-users to archive email into personal folders do not constitute comprehensive recordkeeping of value to the organization as a whole, and these methods flunk the current test under federal e-recordkeeping guidelines for what constitutes an electronic recordkeeping system.¹⁶ At the same time, some percentage of public sector organizations continue to store email on disaster recovery backup tapes with minimal or no recycling involved, as their electronic recordkeeping “solution.” Agency officials are often oblivious to the distinction between “archiving” and “recordkeeping” functions, as well as to the difference between each of those and saving data to disaster recovery backup tapes—thus policies relying on backup tapes may not be seen by them as inherently problematic. Email and other e-records “stored” on these forms of backups, however, have been physically streamed in no logical order and must be “restored” by a labor-intensive process of remounting sets of backups from a single day or session, to extract desired files from reconstructed user accounts. Disaster recovery backup tapes are not databases or logical repositories of

¹⁵ See: GAO Report 08-742: 4. ¹⁶ See: 36 C.F.R. 1236.20 (requiring records disposition functionality and shared access).

information and cannot be easily searched without great time, money and effort.¹⁷ That is why NARA states in its federal recordkeeping regulations that backups “must not be used as the agency electronic recordkeeping system.”¹⁸

A cottage industry of records management applications (RMAs) by way of software products and services also exists. These products and services provide organizations with the capability of empowering end-users with greater control of the ability to perform electronic recordkeeping. The most visible standard for e-recordkeeping is the 5015.2 Standard (now in version 3 form) employed by the U.S. Department of Defense since 1997, which sets out several dozen functional requirements for RMA software to meet in order to demonstrate compliance with federal recordkeeping standards.¹⁹ A significant number of software products have been certified as 5015.2 compliant, and NARA has encouraged their use.²⁰

For all of the support given during the past decade of this “first wave” of 5015.2 compliant RMA applications, they have not been widely deployed to date within government agencies. Part of the problem may be residual difficulty in scaling up the software that comes out of the box, to meet the needs of particular large-scale institutions and enterprises. However, what we perceive to be the much larger issue is the transactional demands that this form of software makes on end-users, the vast majority of whom do not consider records management a top priority as they go about their daily workplace tasks. RMAs modeled on 5015.2 version 3 normally require users to select how individual emails and other e-records are to be managed from drop-down screens. Often times, institutions have not thought through how they would simplify their existing stock of legacy records schedules, so as not to impose a bewildering array of choices on users indicating the series in which individual electronic objects are to be placed. The result in some cases has been failed pilot projects, where users simply rebelled, or in the more usual case, underutilized the RMA application due to the transactional burden involved. The jury measuring the success of RMA applications is still out, however: it may well be that the product lines need further maturation, that the end-user experience will be easier, and that this form of e-recordkeeping solution might eventually become more pervasive than it is currently.

Anecdotal experience with DoD Standard 5015 RMA applications has shown that many individuals do not reliably save, tag, drag or drop most of their email into electronic folders set up with well-intentioned archival purposes in mind. The compliance rate starts off low in this regard, and is invariably getting lower—simply due to massive volumes of information now confronting us all. Having to perform extra keystrokes, no matter how few, on any substantial percentage of electronic communications during the work day, means the equivalent of having to pay a transactional toll per communication, in terms of lost time, energy, and productivity. Few individuals wish to pay the price on a consistent and comprehensive basis, hence, a world of incomplete if not haphazard recordkeeping.

¹⁷ See generally: Grant J. Esposito and Thomas M. Mueller, “Backup Tapes, You Can’t Live With Them and You Can’t Toss Them: Strategies for Dealing with the Litigation Burdens Associated with Backup Tapes Under the Amended Federal Rules of Civil Procedure,” *Richmond Journal of Law and Technology* 13, no. 3 (2006): 1-26, <http://law.richmond.edu/jolt/v13i3/article13.pdf>.

¹⁸ 36 C.F.R. 1236.20(c) (2012).

¹⁹ See: <http://www.archives.gov/records-mgmt/policy/joint-interopability-letter.html>; see also: <http://jitec.fhu.disa.mil/recmgt/>.

²⁰ NARA, “Endorsement of DoD Electronic Records Management Application (RMA) Criteria Standard,” *NARA Bulletin* 2003-03 and 2008-07, versions 2 and 3, respectively, <http://www.archives.gov/records-mgmt/bulletins/2003/2003-03.html> and <http://www.archives.gov/records-mgmt/bulletins/2008/2008-07.html>.

Aside from the inherent problems of backup tapes, the Achilles heel for the remaining above-described methods should be plain: that is, the extent to which these methods rely on individuals to perform recordkeeping (“self-archiving”) at the desktop. Given the reality of the sheer volume of email and other electronic records coming across the transom every day, coupled with the transactional cost of compliance, sole dependence on software that requires diligence by end-users is tantamount to institutions whistling past the graveyard, at least with respect to their immediate e-discovery obligations, and with downstream recordkeeping implications absent strong training and enforcement programs in place. In our view, agencies have a responsibility to look for alternative strategies in light of these real-world considerations.

4. The Promise of Email Archiving Through Automated Capture

As distinct from the above approaches, it is now increasingly apparent that software technology has advanced significantly to the point that we can speak in terms of something truly new: automated email archiving for the enterprise. Such a notion of comprehensive capture of email by automated means conjures up Borgesian visions²¹ of near-infinite library repositories—a dream to some, a nightmare to others, including perhaps appraisal archivists grounded in longstanding notions of what constitutes the “judicious” disposition of records.²² At least today, email archiving software starts with the promise of the comprehensive capture of email, not just as selected by users, but as pulled from the underlying proprietary email system on a continual basis. The concept of “automated email archiving” is predicated on the notion that 100% of email traffic is captured or routed into some form of online or near-line electronic environment. Without the type of fanfare accompanying iPhones and other 21st Century new age gadgetry, this new form of software and services nevertheless has gained a wide audience, and is currently being piloted in a variety of both public and private sector institutions as a way to manage risk, including the risk associated with having to comply with litigation demands for “all” e-communications.

Automated email archiving is wonderfully simple in its conception: email, and whatever else, is captured from whatever email proprietary system or email store is in use on the online server, with the electronic object then placed in a separate database either near-line or offline to be preserved in its native proprietary form under whatever rule set is proscribed. The electronic objects are therefore accessible from a central location. Indeed, the system may well be set up that the user is able to “see” or otherwise freely access such archived email in the separate database as if the email still resided in his or her original in-box (through the use of what is referred to as an email “stub”). From all of the above discussion, it should be clear that the value of such systems for e-discovery purposes is apparent, in lowering the risk of lost records while increasing accessibility through means of expedited searches.²³

As NARA’s bulletin on the subject of email archiving pithily states, “Email archiving applications typically require little to no action on the part of the user to store or manage the email records.”²⁴ NARA recognized that benefits include (i) more efficient storage of email because it is moved from a distributed

²⁴ NARA, “Guidance concerning the use of e-mail archiving applications to store e-mail,” *NARA Bulletin* 2011-03 (December 2010), <http://www.archives.gov/records-mgmt/bulletins/2011/2011-03.html>.

network of servers and desktop applications into one place; (ii) enhanced search capabilities for content germane to subpoenas, FOIA requests, and e-discovery requests; and (ii) assistance in backup and disaster recovery.²⁵ NARA's bulletin goes on to note, however, that "[e]-mail archiving is a relatively new technology and is still developing," and that agencies must appropriately configure and implement records management controls when using the application.²⁶

We believe, however, that solutions already exist in the marketplace that meet some level of the recordkeeping controls that NARA would wish to see in place. For example, consistent with existing records retentions schedules, an agency may decide to implement an automatic rule "tagging" all email created or received by designated senior officials as "permanent." Remaining email from all other agency staff could be categorized as presumptively "temporary" in one or more "big buckets" or folders within an email archiving scheme corresponding to existing record series. Alternatively, a similar tagging rule could be employed for all email created or received by designated components that routinely generate high-level policy or other sensitive documents worthy of long-term preservation.

An agency might elect any number of "add-on" measures, to bring greater nuance to the archiving scheme. These might include simple steps aimed at allowing for users to create individual folders within the email archive, for the limited purpose of ensuring that some measure of "virtual foldering" takes place akin to traditional records management in the paper world. For senior staff with designated permanent records, agencies concerned about over-inclusion of email of a personal or truly ephemeral nature could allow for staff to delete emails from the in-box for a limited period of time (e.g., 60 or 120 days), with any emails remaining then automatically captured as permanent under the "auto-archiving" rule in effect. Conversely, mid- or lower level staff who do create "permanent" records could be allowed a manual override of the "temporary" designation, so as to "opt-in" for records preservation on individual or designated categories of email sent or received.

In marketing email archiving solutions, much has been made of the notion that the software also generally allows for greater records management functionality. One of the multiple reasons why organizations implement email archiving is said to be to meet litigation, regulatory, and/or business records retention requirements, by enabling easier searches of stored email. On closer examination, there appear to be no perfect, scalable solutions yet to truly automating a large organization's email by content, even using techniques borrowed from the world of information retrieval, data mining, and artificial intelligence. Some vendors in the marketplace are, however, touting the ability to have systems intelligently "auto-classify" or "auto-categorize" documents based on some measure of machine learning from examples provided by users themselves.²⁷ Such techniques would serve as proxies to more traditional means of recordkeeping that those of us born in the 20th Century are used to in the workplace. Even now, however, the technologies available in the marketplace go a serious way towards meeting the long-anticipated goal of some archivists in being able to adopt more sophisticated forms of macro-appraisal and "institutional functional analysis," for reliably segregating content by function or activity of an organization,²⁸ and thus are worthy of serious further examination.

5. Limitations of Present-Day Search Methods and A Path Forward

To date, the majority of products and services touting electronic archiving solutions appear to have put their eggs in the back-end search basket, rather than implementing more traditional front-end records management solutions. This suggests that search capabilities are robust enough to replace all other notions of provenance, original order, and the need for any form of granular auto-categorization by record series type, features of a repository that archivists have traditionally expected and demanded. In light of the claims being made, it remains important to accurately measure success in performing robust information retrieval. This is, however, a rapidly evolving field, and alternative solutions to Boolean searching being deployed in present day litigation may yet have important implications, including for members of the archival profession.

To the extent email archiving schemes rely on sorting by means of present-day “search” technologies to perform records management-like classification, they are of course on somewhat shaky ground. As is well known in the information retrieval community,²⁹ the idea that any form of text retrieval algorithm can reliably parse text such as email, based on content alone, into that which is valuable and worth keeping, while setting aside that which is ephemeral and to be disposed, still is viewed as a hard problem—especially if the goal is perfect sorting of records into 20th Century-style, highly granular records schedule buckets. There are, however, a number of products and services in the e-discovery market that take advantage of clustering algorithms and “predictive” analytics, in ways that would greatly advance the auto-categorization task.

This subject has been explored at length in connection with e-discovery issues, through publications including The Sedona Conference® *Best Practices Commentary on the Use of Search and Information Retrieval Methods Used in E-Discovery*.³⁰ The Commentary describes at length the limitations involved in present-day search methods based on keywords and Boolean operators, and suggests that lawyers (and others) should be looking in the short term to alternative forms of search methods. The latter methods now include forms of supervised learning (widely known today in the legal community as “predictive coding”), that makes use of the coding of seed sets of documents, coupled with use of statistical or probabilistic forms of searching based on mathematical clustering models, for the purpose of enabling software to in turn code the vast majority of documents in a given repository.³¹ Given the exponential increases in volume of electronically stored information, lawyers are increasingly taking advantage of the well-known gains in efficiency in relying on these software-assisted methods, which in turn utilize “iterative” feedback loops involving greater transparency in divulging statistical samples to those inquiring about relevant documents.³²

Cox, “Electronic Mail: Implications and Challenges for Records Managers and Archivists,” *The Records & Retrieval Report* 8, no. 9 (1992): 7 (referring to a “macro-appraisal/documentary probe” strategy for email).

²⁹ For citations to the relevant literature, see: Douglas W. Oard and William Webber, “Information Retrieval for E-Discovery,” *Foundations and Trends in Information Retrieval* 6, no. 1 (forthcoming in 2012): 1-144, accessed October 9, 2012, <http://ediscovery.umiaccs.umd.edu/pub.html>.

³⁰ See n.3, *supra*.

³¹ Baron, “Law in the Age of Exabytes.”

³² Paul and Baron, “Information Inflation,” 50.

For example, in the prominent *da Silva Moore* case decided in 2012, a U.S. magistrate judge held that the state-of-the-art in advanced search techniques had progressed to the point where the Court could “bless” the use of the form of supervised learning known as “predictive coding.”³³ The court determined the use of predictive coding was appropriate considering “(1) the parties’ agreement, (2) the vast amount of electronically stored information to be reviewed (over three million documents), (3) the superiority of computer-assisted review to the available alternatives (*i.e.*, linear manual review or keyword searches), (4) the need for cost effectiveness and proportionality . . . ; (5) the transparent process proposed by [defendants].” The opinion included at its end an extraordinarily detailed “joint protocol” worked out by the parties, setting out the construction of seed sets, sampling, and the seven rounds of iterative training of the system for purposes of classifying documents as responsive or nonresponsive. The opinion points to a future of judicially-blessed litigation engagements where supervised learning in lieu of keyword searching are routinely utilized.

Additionally, over the past half decade the limitations of competing information retrieval methods in a legal context have been explored as part of what is known as the “TREC Legal Track,” an international research project sponsored by the U.S. National Institute of Standards and Technology, which ran between 2006 and 2011. The goal of the legal track was to evaluate how alternative forms of search methods perform in a “real-life” situation involving real document databases (consisting to date of seven million tobacco litigation documents, plus the Enron email collection), and a set of hypothetical topics which could have been the subject of e-discovery demands. In other words, the track coordinators wished to draw comparisons as between how well Boolean methods perform against fully automated alternatives proposed and used by scientist-participants in the track. The results of the second year of the Legal Track were eye-opening (at least to lawyers, as opposed to information retrieval researchers): only 22% of the total number of relevant documents were found by traditional keyword or Boolean search methods; 78% were found by all other search methods combined.³⁴ Results from subsequent years have validated the above numbers while also exploring the efficacy of greater use of human-in-the-loop solutions, as well as supervised learning methods.³⁵

The research and analysis represented by the TREC Legal Track points to the difficulty in making very strong claims regarding the efficaciousness of how reliably searches, conducted against a large electronic archive with many millions or billions of objects embedded within it, can successfully classify or segregate information categories. As stated, these methods are rapidly improving, however. Arguably, parsing documents into categories of “relevance” is more difficult than attempting to match documents into relatively broad recordkeeping categories (by series, for example), although any attempt to categorize documents based on content analytics alone will achieve less than perfection. (Of course, some measure of success can be obtained if an organization is willing to set big-bucket rules to designate as permanently valuable “all” records generated by particular individuals or components within the enterprise, without regard to content, as discussed, *supra*.) The bottom line is that while we should remain cautious about naively buying into overly robust assertions regarding the efficacy of searches, there is rapidly emerging

progress in the area of search methods and technologies that archivists and lawyers would be well served to remain aware concerning. The promise of the future is that by employing greater use of sampling and iterative techniques, coupled with new forms of supervised learning, e-record archives can potentially be filtered for other purposes—including for performing macro appraisal and disposition, and for determining where resources are to be allocated to find subsets of electronic repositories that may be made available for access in the nearer term.

There are many approaches to search and information retrieval, only some of which have been explored by those in the legal domain. We turn next to the issue of extracting meaning or “sensemaking” from email archives, an area which holds great promise as it becomes better understood.

6. Sensemaking and the Email Archive

In recent years interest in the study of sensemaking has increased, and one area where this has been evident is in the study of people working with electronic information. If we can understand how people make sense of things and how that can best be supported, we are in a better position to design systems to help sensemaking along, and so help people to engage effectively with increasingly large amounts of electronic content. As both a research area and a practical issue, this interest can be said to be motivated by a need for perspectives that link people’s moment-by-moment interactions with information, such as searching, gathering, extracting, and structuring, with the internal processes of theorizing, interpreting and understanding.

A number of theoretical perspectives on what sensemaking is and what happens during sensemaking have emerged.³⁶ A theme that commonly runs through these accounts is the observation that sensemaking involves a reciprocal interplay between bottom-up exposure to information on the one hand, and the top-down interpretation, structuring or theorizing about information on the other. Each occurs during sensemaking, and each affects the other. Interpretation gives meaning to information and even defines what counts as information (as opposed to ‘noise’). But it is the information which gives support to or challenges the interpretation, perhaps forcing it to be modified or abandoned in favor of another. Sensemaking has been described as a process of placing stimuli into some kind of framework (e.g., a mental narrative, a model of others’ motives and intentions, a spatial “map,” etc.), which then allows us to “comprehend, understand, explain, attribute, extrapolate and predict.”³⁷

The co-dependence between information and interpretation in sensemaking presents something of a paradox. Appreciating what information is relevant to an endeavor depends on interpretation which itself depends on information. We equate this aspect of sensemaking to the idea of the hermeneutic circle.

³⁶ See, e.g., Karl Weick, *Sensemaking in Organisations* (London; Sage, 1995); Brenda Dervin, “An Overview of Sense-making Research: Concepts, Methods, and Results to Date” (paper presented at the International Communications Association Annual Meeting, Dallas, May, 1983); Gary Klein, et al., “A Data-frame Theory of Sensemaking” in *Expertise Out of Context: Proceedings of the Sixth International Conference on Naturalistic Decision Making, Pensacola Beach, Florida, May 15-17, 2003*, ed. Robert Hoffman (Lawrence Erlbaum Associates Inc., 2007), 113-155; Peter Pirolli and Stuart Card, “The Sensemaking Process and Leverage Points for Analyst Technology as Identified Through Cognitive Task Analysis” (paper presented at the International Conference on Intelligence Analysis, McLean, VA, May 2-3, 2005), <https://analysis.mitre.org/proceedings>.

³⁷ William H. Starbuck and Frances J. Milliken, “Executives’ Perceptual Filters: What They Notice and How They Make Sense,” in *The Executive Effect: Concepts and Methods for Studying Top Managers*, ed. Donald C. Hambrick (Greenwich, CT, JAI Press, 1988), 35-65.

Hermeneutics concerns the theory (or art) of interpretation.³⁸ Originally concerned with the interpretation of written texts, contemporary hermeneutics has come to include the analysis of interpretive processes in general. According to the hermeneutic circle, parts of a message can only be understood in terms of an understanding of the whole, and yet an understanding of the whole can only arise from an understanding of the parts.³⁹ Take a sentence—individual words, which individually are susceptible to multiple interpretations, have their interpretation fixed through an interpretation of the sentence as a whole. And yet, the attributed meaning of the sentence whole depends upon how each individual word is interpreted. This scales-up—the interpretation of a message, such as an email, depends upon some theory of the context in which the message originated (e.g., time, culture, language, personalities, roles, motivations, recent activities and relationships)—and yet an understanding of these depends upon the interpretation of many other such messages.

We illustrate this with an example from a study into the ways in which lawyers makes sense of large collections of emails during some e-discovery investigations. Attfield and Blandford⁴⁰ reported an interview study conducted with corporate lawyers who were engaged in a e-discovery investigations. One group of lawyers was investigating potential fraud in the contracts that a company had with another. They conducted keyword searches over a set of recovered documents (primarily emails) and the results were retrieved so that they could manually review them. However, an interpretation of actions in the emails depended upon an understanding of the broader temporal backdrop against which it occurred. For example, the judgment of whether a communication between two parties could be interpreted as bid rigging would depend on when the communication had taken place in relation to a bid lifecycle. But this context was initially unknown, and needed to be constructed from many other similar emails. People may meet, exchange information or even money, but the meaning of these actions, and, important for this example, their meaning in legal terms is fixed by a broader context. Hence, a bootstrapping process must occur at great time and cost. As one senior lawyer said, “the scope of what you’re trying to do is immense and you’re having to define it as you go along.”

Sensemaking involves moving from the part to the whole and back, gradually building an understanding. For the philosopher Schleiermacher, the impasse of the hermeneutic loop can be broken by an initial cursory reading of an entire text followed by detailed readings of specific parts and relating these to the whole. Schleiermacher, however, did not have large email collections to investigate. A cursory reading of thousands to millions and even tens of millions of documents is not possible.

There is, however, an emerging technology which offers an opportunity for addressing the hermeneutic loop. Visual analytics is the science of analytical reasoning supported by interactive visualizations. At its heart is the idea of interactive graphical representations of large datasets which are, in principle, easy to interpret and provide context from which to engage in more detailed investigation. Visual analytics has at its core interactive visualizations which utilize the high bandwidth of the human visual system to enable us to draw insights from large, complex datasets. Computerized visualization is not new, of course, but with the concept of Visual analytics it becomes part of a more holistic study of computer-supported sensemaking. The form of the solution is to perform automated analysis (of some

³⁸ “Hermeneutics” and “interpretation” have a shared etymology. See: Lawrence K. Schmidt *Understanding Hermeneutics* (Stocksfield, UK: Acumen, 2006).

³⁹ Schmidt, *Understanding Hermeneutics*.

⁴⁰ Simon Attfield and Ann Blandford, “Discovery-led Refinement in E-discovery Investigations: Sensemaking, Cognitive Ergonomics and System Design,” *Artificial Intelligence and Law* 18, no. 4 (2010): 387-412.

type) over a document collection and to use the results to structure visual displays that offer insights into the underlying collection. Visual overviews abstract away from data, prioritizing some aspects of underlying content and hiding others.

Visual analytic tools are a relative newcomer to the e-discovery stage, but given the importance of email to this domain, the interactive visual exploration of email has become a significant area of interest.⁴¹ A number of approaches to the visualization of email collections have been offered. It is not our aim to review them here and the interested reader might refer to a review by Lemieux and Baron.⁴² We do, however, refer to one example by way of illustration of the approach.

A research system called Enronic by Heer⁴³ is shown in figure 1. Enronic is an example of a network graph visualization tool. The system takes an email collection and graphically displays connections based on who sent emails to whom. An advantage of generating social networks from email archives lies in the possibility of calculating and social network metrics and using these as display variables. For example, Enronic calculates *connectivity* (often referred to as *degree centrality*) for each

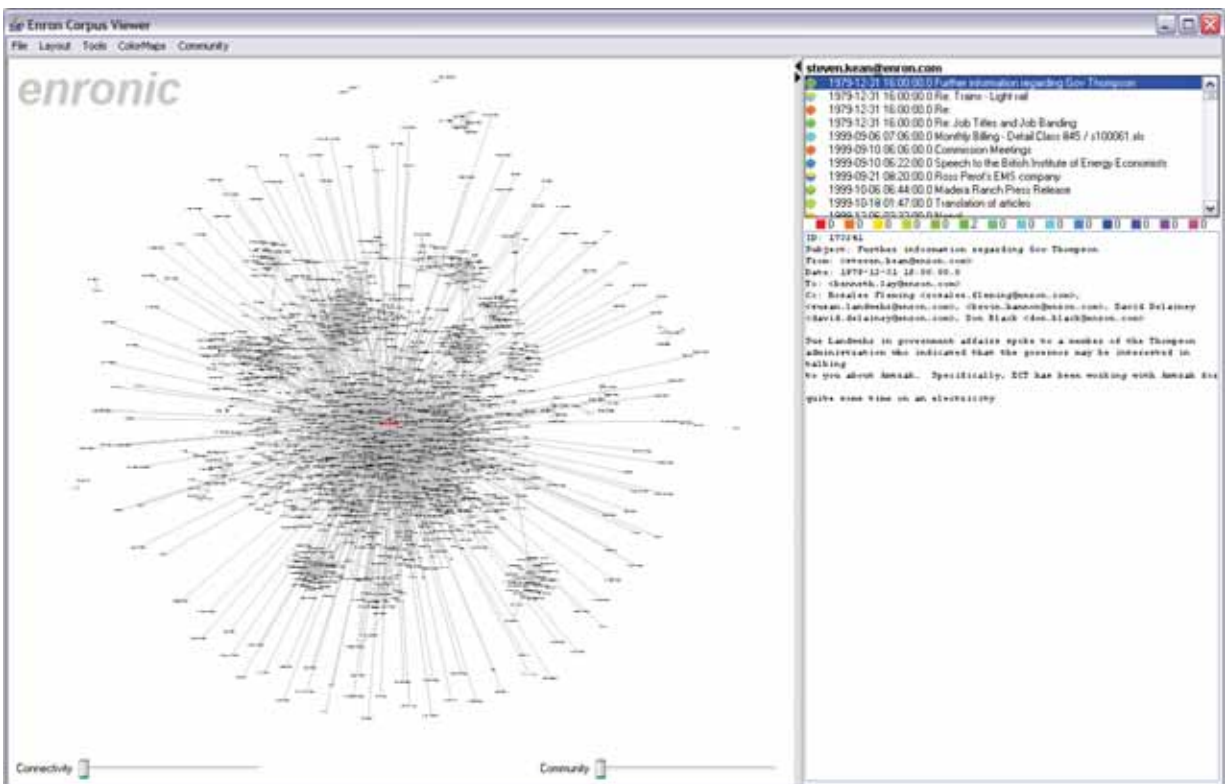

Figure 1. Enronic displays connections inferred from a set of emails, in this case the Enron archive. It provides an interactive visual representation of the network and *connectivity* (*degree centrality*) potentially indicating a person's power or influence within the network.

⁴¹ Victoria L. Lemieux and Jason R. Baron, "Overcoming the Digital Tsunami in E-Discovery: Is Visual Analysis the Answer?" *Canadian Journal of Law and Technology* 9, no. 1 (2011): 33-48.

⁴² Ibid.

⁴³ "Exploring Enron: Visualizing AMLP Results," accessed October 9, 2012, <http://hci.stanford.edu/jheer/projects/enron/v1/>.

node. This is a measure of the number of connections emanating from a node and can potentially indicate a person's power or influence within the network. Various forms of filtering are typical within Visual analytic systems. Enronic allows the user to filter the display for nodes with higher connectivity. Users can also apply an algorithm to hierarchically cluster the network into community substructures and interactively view them in terms of different levels of hierarchical agglomeration.

Displaying the social network implicit within an email collection is one kind of overview representation; it involves exploiting email metadata. As Lemieux and Baron⁴⁴ observe, other common forms include timelines (also based on metadata) and representations of content such as galaxy views in which similar documents are clustered together. From the perspective of a given investigation, one type of view may not be enough. And so we anticipate that systems that support people in making sense of email archives (for litigation purposes or otherwise) will incorporate multiple interactive visualizations of different types. Further, multiple, tightly coupled visualizations may be used concurrently, with users cross-referencing between, or sequentially, with different visualizations suited to different tasks in an analytic chain and at different scales of magnitude.

Sensemaking is frequently slow and painstaking. However, Visual analytic tools in conjunction hold out some promise for constructing scalable methods for making sense of large collections of documents such as emails. Just as these tools are becoming more significant for lawyers, so too we expect that they will become more significant for archivists, historians and others interested in uncovering hidden secrets that email archives may have to offer.

7. The Archivist of the Future and The Modern Digital Archive

Archivists and records managers need to confront reality in understanding that institutions are facing extraordinary pressures to adopt such automated email archiving schemes. With the encouragement of the Archivist's Directive, and in the absence of prior institutional motivation to move forward with other forms of automated or electronic recordkeeping (e.g., 5015.2 compliant solutions), a present day vacuum exists: those institutions (including most of the U.S. government) that still live in a paper-based world with respect to their default, official recordkeeping system will likely leapfrog to automated capture schemes involving email archiving before they make large expenditures in deploying other forms of enterprise-wide software. The inevitable result: automated email archiving scheme will, more likely than not, also be perceived to be an institution's *state of the art records management scheme*, and it will be exceedingly difficult to convince end-users to continue any semblance of other means of recordkeeping, in the face of the knowledge that email archiving exists.

This brings us to the final, most profound challenge that current day automated email archiving schemes pose to archivists and historians: the desire on the part of institutions to save everything for the here and now, but to delete (almost) everything after a prescribed period of years (e.g., all non-permanent records). Automated email archiving has a kind of "July 4 fireworks" aspect. In the United States, July 4th—Independence Day—is a day traditionally celebrated with fireworks, which are of course both highly illuminating and highly ephemeral in nature. The profound problem posed by automated email archiving is that it has the potential to turn out to contain no "archives" of any sort—rather, it may have been conceived to date by some individuals and institutions as simply a short-term fix consisting of

⁴⁴ Ibid.

information that may be wholly deleted after a set term of years (without the need for any form of segregation of “permanent” record holdings). Such an archives, despite the vast amount of information contained within, would ironically leave no permanent mark. Like fireworks, petabytes or exabytes of electronic records would alight the sky for a brief period of years, and then, in terms of the institutional memory of the public sector in the 21st century, all would grow dark. The Archivist’s Directive challenges the federal sector in the United States to address the need to extract “meaning” from federal databases by the end of this decade, by segregating permanent records for preservation in electronic form. However, all institutions confront similar issues in separating the permanent from the ephemeral.

The gauntlet being thrown down to the archival profession should be clear: records managers and archivists of all stripes demand that deployment of any such capturing schemes be accompanied by some recognition on the part of the institution that, if they are to morph into the *de facto* recordkeeping scheme for the institution, the business rules of the institution should well call for categories of “permanent” and “temporary” records being culled out and properly segregated. To the extent the IT community is empowered to build such structures, others within the organization should fairly see them for what they are, and demand front-end thinking in the procurement cycle as to the long-term records management implications of deployment. In doing so, archivists and records managers may yet be able to import “the best of” 5015.2 electronic recordkeeping into a model for automated email archiving, with greater use of auto-categorization methods, to come up with workable hybrid model.

This paper argues that we should acknowledge the obvious: end-users cannot cope with recordkeeping demands imposed by email, and thus, the end of the end user as records manager is near. But what does the implication of automated electronic archiving mean for future records managers and archivists? What role do they have to play when retention environments are “fully automated”? Records managers and archivists hold the potential to exercise enormous influence on how electronic records are managed and preserved, including ensuring that electronic archiving systems with recordkeeping functionality are sufficiently in place to allow for contemporaneous capture of permanent records in electronic forms, for immediate copying and eventual migration to the archival institution itself. This is an idea whose time has come.

In light of the reality of litigation, we believe that the “least worst” solution is for institutions to put into place automated capture solutions for email for purposes of information governance and overall risk management. We also see a need for future archivists to accept and prepare for the technological future that confronts them. This is a future where intelligent filters and automated rules-based systems replace records series and records categorization as practiced in the 20th Century; and where both front-end and back-end solutions based on notions of artificial intelligence, data mining, content and visual analytics, and the like are increasingly employed to separate wheat from chaff, the permanently valuable from the flotsam and jetsam of more ephemeral forms of records. Through such means archivists will truly make sense of the modern email archive.

Writing in *The American Archivist*, Richard Pierce-Moses has spoken to the demands on the archivist of the future in a similar vein:

[A]rchivists should become as comfortable working with digital records as they are working with traditional media. Instead of pen and paper, we will work with cursor and keyboard. Instead of sorters, we will work with sorting algorithms. Rather than weeding, we will filter. With few exceptions, all archivists will need to know what we now call technical skills as the vast majority of contemporary and future records are and will be digital. Different archivists will need different technical skills No doubt some

archivists will continue to specialize, but their specializations will be specific to the digital arena: databases, image and audio formats and metadata, but also user interfaces, search systems, and digital preservation.⁴⁵

The volume, growth, and complexity of electronic records is confronting the legal and business sectors with serious challenges, and as we have argued elsewhere, a critical juncture has been reached where 20th century ways of doing business, at least in terms of responding to discovery demands in lawsuits, no longer suffice.⁴⁶ Litigation and other forms of external access demands may be drivers of change, but they need not drive organizations off the cliff in terms of adopting reasonable solutions for the management of records both in line with short-term business needs and for history's larger purposes. Archivists and records managers, working with lawyers, IT staff, and business executives, have the opportunity to collaborate in coming up with appropriate business models that satisfactorily take into account all of these competing demands and priorities. This is not an easy road for the archivist of the future, but it is a necessary one.

Finally, we have no doubt that changing technology in this area will render some of what is said here rapidly obsolete. We trust, however, that there is more than a little value in attempting to stake out a position on these subjects, even if in so doing one must recognize that we are all engulfed inside a vortex of transformative change. The change is in our workplaces as well as in our collective cultures, with respect to what constitutes the adequate capture in modern digital archives of permanently valuable electronic records, both for business purposes as well as for the sake of history's greater illumination.⁴⁷

Strengthening the Regulatory Framework in a Digital Environment

A Review of Archives Legislation

Elaine Goh

School of Library, Archival and Information Studies, The University of British Columbia, Canada

Abstract

This paper outlines some of the challenges posed to archival legislation in Commonwealth countries regarding the creation, management, and preservation of records in increasingly complex digital environments. The author argues that archival science can contribute to the strengthening of current archival legislation, so as to address issues in the digital environment. The author also proposes future areas of empirical research on archival legislation.

Author

Elaine Goh is a doctoral student at the University of British Columbia. Her research interest is on archival legislation in Commonwealth countries and on organizational culture and behaviour. Elaine is a graduate research assistant of the International Research on Permanent Authentic Records in Electronic Systems (InterPARES) Project. Prior to starting her doctoral program, Elaine worked as the Assistant Director of Records Management in the National Archives of Singapore.

1. Law and Technological Development

Legislation is one of the “medium(s) through which law is expressed.”¹ One approach in terms of understanding how law is expressed is the instrumental and functionalist perspective. This perspective argues that the rules of law should be imbued with certain qualities or attributes. For example, the rules of law should be stable in terms of comprising “determinate requirements that people should consult before acting and not retrospectively establish legal obligations.”² The law should have the quality of clarity and precision, so that those involved in the implementation and enforcement of the law understand the rules and are able to apply the law consistently.³ The law should also be imbued with the quality of “foreseeability” in terms of its ability to predict future events, in order to guide human actions and behavior.⁴ Despite the fact that most legislations aim to have “precise prescriptions”, such prescriptions may not necessarily be a “faithful description of any state of affairs but a complex ideal that is even more complex to realize.”⁵

¹ Wim Voermans, “Quality of EU Legislation Under Scrutiny: What Kind of Problem, by what Kind of Standards,” in *Quality of Legislation - Principles and Instruments - Proceedings of the Ninth Congress of the International Association of Legislation (IAL) in Lisbon, June 24th-25th, 2010*, ed. Luzius Mader and Marta Tavares de Almeida (Germany: Nomos, 2011), 35.

⁵ Roderick A. Macdonald, “Legislation and Governance,” in *Rediscovering Fuller: Essays on Implicit Law and Institutional Design*, ed. Willem J. Witteveen and Wilbren Van der Burg (Amsterdam: Amsterdam University Press,

In the legal literature, there has been extensive coverage with regard to the inability of the law to keep up with technological change. According to Moses, “as technology gives rise to new possibilities, and people engage in new forms of conduct, the law continues to be directed to solving old problems and is unable to keep up with the modern world.”⁶ Consequently, “technological change can make the law become unclear and it can make law that was previously unobjectionable become subject to criticisms.”⁷ Another risk caused by the inability of the law to address technological developments is that “courts and legal practitioners are faced with applying decades—and even centuries—old definitions and principles to radical technologies not even conceived of less than twenty years ago.”⁸

One area where one can witness the inability of existing laws to address challenges in the digital environment are records related legislations, which is defined as legislation that “deals with records or information generally such as evidence legislation, which is not in connection with a specific legislated activity.”⁹ This can be illustrated by the recent review of the *Evidence Act (1997)* in Singapore. The Minister of Law in Singapore in the second reading of the Evidence (Amendment) Bill explained that when the act was first introduced in 1996, a “cautious approach” was taken in terms of admissibility of computer output as evidence.¹⁰ The Minister described the approach as a “cumbersome process not consonant with modern realities” and stressed that “computer output evidence should not be treated differently from other evidence.”¹¹ The Minister’s comments resonated with a consultation paper by the Singapore Law Academy.

The Academy claimed that that the *Evidence (Amendment) Act 1996* was developed on the premise that the certification of electronic records was based on a client-server network model, where responsibility of records is vested with the systems administrator. However, businesses are now adopting a delegated responsibility model, where responsibility for the computing system and business operations are now distributed among the client, information technology vendors and with other service providers.¹² The Academy observed that “in such computing and business models, it will be hard to identify the party or organisation responsible for the reliability of the electronic evidence.”¹³ The statement made by the Academy outlines some of the major challenges faced by archivists and records professionals in terms of ensuring the long-term trustworthiness of records over space and through time, particularly through the

use of cloud computing. Cloud computing poses several risks that can compromise security and adversely affect the governance framework for the management and preservation of records. These risks reflect the need of developing and strengthening existing archives acts in relation to records management functions. As argued by Chasse, “the silence of case law does not justify the silence of legislation. The impact of electronic technology upon law and practice, and its rapid change, should lead to the conclusion that legislation is needed before the law is demonstrably inadequate.”¹⁴

2. Objectives

This paper outlines the major challenges posed by digital technologies, particularly in a cloud computing environment, and discusses how such an environment can compromise the trustworthiness of records. The paper puts forth the position that a strong archival legislation can help to institute adequate controls for the proper creation, maintenance and preservation of records. In addition, the paper highlights some of the current weakness and inadequacies of certain archives acts, and argues that archival science can bridge the gap between the current archival legislation and its ability to address issues in the digital environment. Finally, the paper concludes by recommending some possible areas of research relating to archival legislation.

3. Challenges in the Cloud Computing Environment

Cloud computing is defined as a “model for enabling convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers storage, applications and services) that can be rapidly provisioned and released with minimal management effort or cloud provider interaction.”¹⁵ Cloud computing is not a new technology per se, but it is regarded as a novel service delivery model, designed to bring about better economies of scale and scalability of information technology services and infrastructure.¹⁶ Tucker, in a CTO Roundtable discussion explained, “cloud computing is not so much a definition of a single term as a trend in service delivery taking place today.”¹⁷

The National Institute of Standards and Technology in the United States has outlined three service models.¹⁸ First, the Cloud Software-as-a-Service (SaaS) allows consumers to access the application system, and the cloud service provider will provide the necessary infrastructure and application capabilities. Second, the Cloud Platform-as-a-Service (PaaS) involves the cloud provider supplying the necessary infrastructure, operating environments, and tools for the development of specifically created or

acquired applications by the consumer. Finally, under the Infrastructure-as-a-Service (IaaS), model, the consumer does not physically manage the infrastructure, such as computers and networks, but the consumer has the flexibility to control both the operating environment, such as the type of operating system and database, and type of application systems.¹⁹ Regardless of the model adopted by the user, cloud computing is essentially a distributed service delivery model, which involves the outsourcing of information and communications technology (ICT). This has implications in terms of the management and preservation of digital records.

One challenge in cloud computing is concerns raised with regard to the security of the recordkeeping infrastructure. Cloud providers may make changes to the computing infrastructure, the operating environment, and/or the application implementation, in order to deal with issues relating to usage load and storage. These technological changes may inadvertently affect the security of the recordkeeping system.²⁰ The nature and extend of this effect is partly dependent on the specific type of service model. For example, the use of SaaS as a cloud service model, i.e., web-based collaboration tools such as Google Apps, means that the responsibility for network, infrastructure security, and application code security primarily vests with the cloud provider.²¹ In an IaaS service model, the cloud provider has control over the security of the computing facility, whereas the cloud user has control and responsibility over the application code.²²

There are also transborder jurisdictional issues with regard to the control of records in a cloud computing environment, since records may be stored on data centres in different locations. Certain countries may not necessarily conform to the data protection and privacy related legislations and policies of the countries of the record creators.²³ There might also be an “unknown number of copies of the same digital document in different iterations across different jurisdictions” which “could affect the identification of relevant data for criminal proceedings.” Multiple copies of records also pose problems for records retention, since it is “common for service providers to replicate records for multiple backup, sending copies to sites in different locations or even different jurisdictions” and “this can mean that time-expired records are not properly deleted from every server held in every site.”²⁴ The accuracy, reliability and authenticity of records is at risk if the identity of the records are altered, should there be a lack of audit trails of the recordkeeping system and if there are no proper procedures to ensure proper delineation

of responsibility between the cloud provider and the user.²⁵ Issues with regard to the ownership, custody of records are also at risk, particularly if service providers merge and dissolve. In addition, there are challenges in exporting and migrating records across various platforms, particularly if record owners decide to change cloud providers.²⁶ These data migration challenges can be due to the incompatibility of data storage and transmission formats between vendors, or the sheer scale and complexity of the data to be migrated.

Given such challenges, it is clear that outsourcing of ICT services does not mean an outsourcing of risks. Record creators cannot entirely trust records in a cloud computing environment and it will require far more than authentication technologies to enable such records to be trustworthy. When archivists speak of trust in records, we refer to the “accuracy, reliability and authenticity of records.”²⁷ As “targets of our primary trust,” we can place our trusts on records, provided that there are adequate controls on the policies, procedures, mechanisms governing the record’s creation and maintenance stage.²⁸ However, trust is also a “three part relation that is grounded in the truster’s assessment of the intentions of the trusted with respect to some action.”²⁹ Hardy adds that “A trusts B to do X” and that “trust depends on the context.”³⁰ This relational aspect of trust relations between records creators and government agencies can be enforced through understanding these two parties as “agencies of accountability.”³¹ These agencies “provide insurance of trustworthy conduct, by putting pressure (facilitating, controlling or sanctioning) on persons, roles, institutions or systems that are the targets of our primary trust.”³² The trust relations between the record creator and the national archives can be enforced through articulating their roles and responsibilities as articulated in the archives law. Given that the trustworthiness of records are at risk in a digital environment and given the importance of recordkeeping in society, the law can help in sustaining the “trust relationship” between the creating agency and the preserver by “(taking) over those areas in which there is significant value at stake.”³³

4. Analysis of Archival Legislation in Commonwealth Countries

Archives researchers have critiqued the archives acts in their respective countries as being ineffectual and reactive with regard to management of digital records. Archives acts are described as being “weak”, “outdated, “old and inconsistent.”³⁴ Most archival legislation in Commonwealth countries based their

archival legislation on the UK Public Record Act of 1958, an act written for a paper based records environment and unable to meet the challenges posed by the digital environment.³⁵ In fact, the National Archives in UK consultation paper on a proposed archival legislation writes,

The public sector needs a legislative framework which will assure the accuracy and comprehensiveness of the records it makes. Keeping records that can serve as evidence of an organisation's policies, procedures, actions and decisions, and associated matters of governance, accountability and propriety cannot be left to chance.³⁶

One weakness of the current archival legislation in Commonwealth countries is that it does not stipulate the recordkeeping roles and responsibilities of government agencies as records creators. The act only states that government agencies should seek responsibility from the national authority before destroying public records. Most archival legislation in Commonwealth countries stipulate the role of the national archives in terms of acquiring, preserving and promoting access to archival records. In other words, the archival legislation fulfils a constitutional function in terms of establishing an institution.³⁷ The archival legislation in Canada and Singapore also states that the national archives should play an advisory role in conducting or facilitating the development of a records and/or information management programme in the government. In Singapore, the act even state that the national archives "shall advice public officers concerning standards and procedures pertaining to the management of public records."³⁸ However, archival legislation in Canada and Singapore is notably silent with regard to the shared lines of responsibilities and the accountability structures, with regards to recordkeeping and preservation, between record creators and the national archives. As such, there is no means of verifying that records creators and preservers fulfill their responsibilities according to accepted professional standards.

Establishing lines of responsibilities and an accountability framework through an archival legislation helps to preserve the trustworthiness of records. Through such lines of responsibilities and accountability frameworks, the creating agency is given the "primary responsibility for their reliability and authenticity while they are needed for business purposes," while the archives is accorded "responsibility for their authenticity over the long-term."³⁹ Moreover, as the reliability of records is dependent on the "completeness of the record's form and the amount of control exercised on the process of its creation," archival legislation should specify that government agencies must exercise due diligence

³⁹ Luciana Duranti, "The Impact of Digital Technology on Archival Science," *Archival Science* 1, no. 1 (2001): 49, <http://dx.doi.org/10.1007/BF02435638>.

in outsourcing government records to third party service providers, ensuring that adequate measures are in place for the agency to exercise control over the identity and integrity of its records.⁴⁰

Nevertheless, there are some archival legislation which attempt to specify the roles and responsibilities of both the record creator and preserver. For example, the *Public Records (Scotland) Act 2011* states that government agencies should submit a records management plan to the archival authority.⁴¹ The archival authority, in turn, is required to submit an annual plan to the Scottish Ministers on the records management plans submitted by the agencies. The archival authority needs to include details such as the records management reviews that they conducted, as well as the “names of any authorities that have failed to comply with any of the requirements of an action notice together with details of the alleged failures.”⁴² Another example of an archives act which states the recordkeeping responsibilities of both public offices and the archival authority is the Public Records Act (2005) in New Zealand. The act specifies the recordkeeping responsibilities of public officers with regard to the creation and maintenance of “full and accurate records of its affairs, in accordance with normal, prudence business practice, including the records of any matter that is contracted out to an independent contractor.”⁴³ The act requires that records under the control of public officers must be maintained in an “accessible form” until the disposal of the records are “authorised by or under this Act or required by or under another Act.”⁴⁴ The act also articulates the role of the Chief Archivist in issuing standards relating to the creation, maintenance, appraisal and access to records. The Chief Archivist is expected to present a report to the Minister on recordkeeping practices in public officers annually, and to conduct an audit of recordkeeping practices of the public sector.⁴⁵

Specifying the roles and responsibilities of both the record creator and the preserver in the archival legislation is important in a digital environment, as it is based on the premise that “management of digital records must proceed from a comprehensive understanding of all phases or stages in the lifecycle of records, from the time they are generated, through their maintenance by their creator, and during their appraisal, disposition and long-term preservation as authentic memorials of the actions and matters of which they are a part.”⁴⁶ It will also be useful if archival legislation provides a definition of archival concepts like reliability and authenticity, which would apply to both the record creator and the archives. For example, authenticity is the trustworthiness of a record as a record and is dependent on the “record’s state, mode and form of transmission, and to the manner of its preservation and custody.”⁴⁷ As such,

maintaining and preserving the authenticity of records is a joint responsibility between both the record creator and the archives.

The second weakness of the archival legislation in Commonwealth countries is that the acts typically state that government agencies should seek permission from the national archives before destroying public records. Such a clause works on the assumption that appraisal of records takes place only at the end of the lifecycle when the records become inactive. In reality, appraisal of records, particularly in the digital environment, should be conducted during the active stage of the record's lifecycle. This will enable the archivist to obtain documentation about the recordkeeping environment of the creating agency as well as technical documentation on the digital system which creates and maintains the records.⁴⁸ There is also a need to monitor the appraised electronic records before the records are transferred into archival custody so as to ensure that there are no significant changes in the records and the recordkeeping environment, which can affect the identity and integrity of the records.⁴⁹ Moreover, the timely appraisal of records is in line with the chain of preservation concept. This concept is based on the premise that "from the perspective of long-term or continuing or enduring preservation, all the activities to manage records throughout their existence are linked, as in a chain, and interdependent."⁵⁰ Last but not least, the absence of the use of the term appraisal in a number of archives legislation means that archivists lack "adequate legislative or policy foundations" and that "without a proper mandate to act towards achieving their goal, archivists work at a distinct disadvantage."⁵¹

Another limitation of the archival legislation in Commonwealth countries is they tend to state that records should be transferred to archival custody several decades after they have become inactive.⁵² For example, the Public Record Act (1958) stipulates that public records "shall be transferred not later than thirty years after their creation either to the Public Record Office or to such other place of deposit appointed by the Lord Chancellor under this Act as the Lord Chancellor may direct." Although records may be transferred to archival custody earlier than 30 years between the archives and the transferring agency, the archives act works on the assumption that preservation requirements tend to be incorporated during the end of the record's lifecycle. The lengthy time frame for the transfer of records is not an

effective strategy to address the management of digital records, where preservation requirements should be “incorporated and manifested in the design of record-making and recordkeeping systems.”⁵³

Finally, archival legislation in Commonwealth countries has varied ways in defining the concept of records and archives. Some of these definitions linked records and archives in terms of its value, in relation to an activity, the passage of time and transfer to an archival institution. For example, the archives act in Singapore differentiates public records as “records of any kind whatsoever produced or received by any public office in the transaction of official business or by any officer in the course of his official duties,” whereas public archives are those records which are “more than 25 years old” of “national or historical significance” and which have been transferred to archival custody.⁵⁴ Such a definition tends to associate public records and public archives in terms of physical placement, which results in a conceptual divide between the management of active and inactive records.⁵⁵ The movement towards increasing privatisation within the public sector means that records from such organizations that do not fall into the schedule of public bodies are potentially excluded from the archives act. Furthermore, such a definition is limiting not only in a traditional analogue environment but also in the digital environment. In the digital environment, it may be potentially contentious to determine which instantiation of the same digital entity belong to whom, especially when there are multiple service providers.

5. Conclusion - Call for Future Empirical Research

The weakness of the archival legislation illustrates the inadequacy, “under-inclusiveness” and the “obsolescence of existing legal rules” in dealing with the challenges posed by the digital environment and the changing nature of public administration.⁵⁶ There is a need to strengthen archival legislation through incorporating archival science including concepts, like the chain of preservation, reliability, and authenticity, as well as the theory of provenance. Duranti notes that the archival legislation of ancient Rome was anchored on the principles of archival science. For example, concepts such as the unbroken chain of custody and the 1898 Dutch manual on arrangement and description were based on early Roman law.⁵⁷ However, with the passage of time, archival legislation departed from the principles and concepts of archival science. As such, there is a need for archivists to revisit these principles and concepts and to work with legislators to strengthen the legislative framework of the archives law.

Finally, one area that requires further empirical research is to understand the perspectives of archivists and records professionals on whether the archives act provides them with a framework to

⁵³ InterPARES 2, “Appendix 19 - A Framework of Principles for the Development of Policies, Strategies and Standards for the Long-term Preservation of Digital Records,” in *International Research on Permanent Authentic Records in Electronic Systems (InterPARES) 2 Experiential, Interactive and Dynamic Records*, ed. effectively manage records. The application and implementation of an archival legislation involves interaction among stakeholders from different government agencies, including the national archives, and this process of interaction is not adequately covered in case law. Another related area of research is to explore organizational dynamics and interactions among archivists and government representatives as they negotiate their responsibilities in relation to an archives act, including how they interpret and apply an archives act in the management of records. For example, Hurley observed that there was the “interplay of bureaucratic politics” in the implementation of the *State Records Act* in New South Wales and the act was even “opposed and watered down by other agencies who believe that their turf is being invaded.”⁵⁸ Hurley’s statement is a reminder to archivists and records professionals that it is useful to go beyond the instrumental approach in understanding law in terms of its “explicit rules, specialised offices and institutions, and determinate procedures.”⁵⁹ There is also a need to understand archival legislation from the bottom-up. Such a perspective will illustrate the gaps between the law in theory and the law and in practice through providing an insight on why and in what circumstances archivists and records professionals interact with the archives act, as well as cases where the archives act is not relied upon by records professionals.

Digital Curation: Convergence of Challenges, Institutions and Knowledge

Digital Curation

The Challenge Driving Convergence across Memory Institutions

Sarah Higgins

Abstract

Collaboration between libraries, archives and museums (LAMS) is undertaken in a continuum which starts with an initial understanding of the differences between the disciplines, and can lead to full convergence with a shared mission and delivery of shared services. Collaboration brings increasing benefits in resource efficiencies and user uptake as participating organizations progress through the continuum. It is in the area of digital content creation and management that the synergies of the disciplines are most often harnessed through cooperative exploration, coordinated projects and collaborative services. This paper examines and extends the Collaboration Continuum first identified by Soehner¹ and elaborated by Zorich, Gunter, and Erway² through analyses of the existing research into the nature of LAM collaboration, and identification of the core ethical differences which govern seemingly similar agenda. The paper proposes digital curation as the “change agent” which will bring about full convergence between the professions, as they move through the digital content and management continuum.

Author

Sarah Higgins lectures in Archives Administration and Records Management at Aberystwyth University, where her research focuses on the lifecycle management of digital materials. She was formerly at the Digital Curation Centre (DCC) where she led the DCC Curation Lifecycle Model Project and the standards advisory function. She moved to the DCC from the University of Edinburgh where she undertook various metadata development and co-ordination roles across their cultural collections. A trained cartographer her first archival role was curating the British Antarctic Survey’s Geographical Information Collection and acting as Secretary to the UK Government’s Advisory Committee on Antarctic Place-names.

1. Introduction

Libraries, archives and museums (LAM) are increasingly undertaking joint activities to address gaps in their resources or skills, or to create new services for their existing users; and greater visibility to potential users. Such activities, endorsed by their respective professional organisations, embrace: trust building activities such as professional networking events; coordination activities such as co-location of services; and collaborative activities such as joint outreach programmes. However, it is in the area of catalogue federation and digital content creation and management that collaborative projects have started to lead to shared services. As professional best practice develops and projects mature, LAMs are starting to

converge over the need to provide for the long-term access, use and reuse of their digital materials, both digitized and born-digital, through the new discipline of digital curation.³

2. Collaboration across LAMS

LAMs have maintained a distinct identity, and the commonalities of their core remits and procedures “have not historically been dominant features in the self-characterization of libraries, museums and archives.”⁴ However the possibilities afforded by cross-collaboration have been examined for a number of years with a number of high profile conferences, initiated by the library profession, addressing the topic. The Library Automation Group Conference in 2000 (*Archives, Libraries and Museums Convergence*) looked in detail at cooperative digital projects across LAMs.⁵ The *Choices and Challenges Conferences* of 2002 and 2004 identified the dominant themes of “invisibility, advocacy, convergence and collaboration, and focusing on the researchers and visitors” realising that “... preserving the record, whether it is a text, a photograph, or an object requires collaboration among cultural resource professionals, researchers, visitors, and the public.”⁶

In 2005 the Research Libraries Group (RLG) Conference (*Libraries, Archives, and Museums: Three-ring Circus, One Big Show?*) explored the possibilities for federated searching across collections. This was followed in 2006 by the Rare Books and Manuscripts Section (RBMS) of the American Library Association (ALA) Conference (*Libraries, Archives, and Museums in the Twenty-First Century: Intersecting Missions, Converging Futures?*) taking the conversation a step further by examining the question “to what extent do common goals imply common means?” through a series of case study presentations.⁷ The American Society for Information Science & Technology (ASIS&T) 2009 panel session (*Information Organization in Libraries, Archives and Museums: Converging Practices and Collaboration Opportunities*) examined the range of collaboration opportunities across the sectors and the convergence of information organization practices.⁸ The conversation turned global in 2011 with the International Conference on the Convergence of Libraries, Archives and Museums (ICLAM) 2011 (*User Empowerment through Digital Technologies*) scrutinising the advantages of a converged information environment for the user.⁹

Collaboration between LAMs is being encouraged at the highest professional level, with IFLA, ICA and ICOM joining with the International Council on Monuments and Sites (ICOMOS) and the Coordinating Council of Audiovisual Archives Associations (CCAAA) to form the International NGO Working Group on Convergence in 2008.¹⁰ Later renamed the Libraries, Archives, Museums, Monuments and Sites (LAMMS) Coordinating Council, the group's projects focus on the areas of: copyright and other legal matters, working within the World Intellectual Property Organization (WIPO); political lobbying and practical measures to ensure the safety of cultural heritage, within the activities of the Blue Shield and UNESCO; and the development and standardization for global digital libraries.¹¹

Few research projects have investigated the nature of collaborative activity across LAMs. A comparison of museum and library collaborations in England and the USA identified the short-term subject based project nature of these, with the English focusing on history, while the US focused on art and literature.¹² Yeates and Guy exam cross-domain collaboration to develop a local interest federated resource, identifying the driving force of the projects technical staff.¹³ A report funded by IFLA identified, examined and classified a wide range of collaborative activities across archives, museums and public libraries at local level, in the developed world, formulating a best practice guide for their success.¹⁴ Collaborative activity was found to be taking place in: event programming, integrated facilities such as education and exhibition space, and collaborative digital resource creation. An OCLC research project from 2008-2010 built on the RLG and RBMS conferences to examine collaboration in the context of LAMs with the same organizational governance, which were already committed to working together.¹⁵ Their series of five mediated workshops identified a shared vision "of seamless collections access and community engagement on local Web sites."¹⁶ Again collaborative activity was identified as project based, with the participating organizations focusing on shared creation and storage of digital materials, and the provision of search tools for their discovery. They identified that "with the ever increasing acquisition of born-digital materials, traditional boundaries begin to blend."¹⁷ Lee considers how political and cultural barriers in pan-continental projects can compromise the ability to provide consistent

commitment for collaborative ventures, identifying successful projects across Europe, North America and East Asia.¹⁸

3. Cumulative Collaboration

Collaboration across similar, but fundamentally different organizations cannot develop without a mutual trust, which needs to be established over time. Zorich, Waibel, and Erway,¹⁹ building on an address from the RLG Forum,²⁰ articulate a collaborative continuum model which identifies the cumulative development of such trust, and the increasingly sophisticated investment, risk and benefits which accrue. The cumulative nature of collaboration has also been noted by Dornseif²¹ who identified different levels of commitment in collaborative activity between co-located services. These two models of cumulative collaboration can be combined with the roles and responsibilities, benefits, risks and measures for success identified by the various research studies discussed above, to build an understanding of how as collaborative activities mature, commitments, benefits and risk increase, while organizations become more inter-dependent (Figure 1).

Collaborative activity between LAMs starts with *conversance*. An understanding of the professional landscape is developed by keeping abreast of professional developments through channels such as the media, newsletters, webmail or RSS feeds. This low risk activity builds an understanding of the possibilities afforded by collaboration. Conversance may lead to *contact* either in person or through social media channels such as Twitter or Facebook. This casual experimental networking enables the exploration of commonalities such as subject, place, audience or aim. Minimal resources are expended and no commitments are made, however collaborative ideas may start to emerge and a trust relationship may start to grow. Minimal integration *cooperative* activities such as meeting together to share information on a shared point of interest will build further trust so that a vision of future activities can start to develop. The risk increases as LAMs move into *coordination*. Short-term jointly coordinated projects need a commitment from all parties to work together with a common goal to undertake an activity for a clearly defined audience. Such projects include Web based or physical joint exhibitions, educational activities or lecture programmes. Success in such selective projects requires guidance from: an engaged management; a dedicated project manager and clear aims and objectives with feasible timelines. Projects need the benefit of a stable administrative base and resources, which have been carefully planned, along with a commitment to timely communication. The risks increase proportionately to the resource expended, and projects can founder on a lack of commitment to overcome differences in procedures, priorities and language. Even one or two staff with a resistant attitude to coordinated activity can risk its success through lack of commitment to the project's goal. Co-location of services is a form of cooperation where a management commitment has risked locating seemingly similar organizations in the same managerial, and sometimes also physical space, so that there is opportunity is created for resources

Collaboration Continuum	Conversance	Contact	Cooperation	Coordination	Collaboration	Convergence
Level of Integration	None	Experimental	Minimal	Selective		Full
Commitment	None	Casual networking	Trust building	Shared goal with a separable administrative framework	Shared vision with changed working practices and inter-dependencies	Shared mission and service delivery
Activities	Keeping abreast of professional developments	Exploration of differences and commonalities	Information sharing	Joint projects	Joint projects leading to shared services	Shared infrastructure
Triggers for Moving Along the Continuum	- Resources gap: skills, financial, infrastructure - Change agent: Management mandate, Staff incentives, Funding availability					
Benefits	<div>  <p> - Trust > Vision > Commitment > Investment > Confidence > Ambition - Staff development > Professional flexibility > Best Practice Developed - Shared resources (human, financial and infrastructure > Resource efficiencies - Services, Outreach, Catalogues, Digital resources > More users </p> </div>					
Risks	Minimal	Minimal <ul style="list-style-type: none"> - Low resource commitment - Easy to walk away 	<ul style="list-style-type: none"> - Lack of common goal /vision and resistant attitudes - Different procedures and priorities - Lack of common language - Insufficient resource capacity - Domination by one organization - Problems with intellectual property rights - Management commitment and involvement - Engaged and committed staff (through incentives or encouragement) - Tangible stable resources (human, financial and infrastructure) - Clear aims and objectives - Clearly defined audience - Staff training 			<ul style="list-style-type: none"> - Differences not addressed prior to commitment
Measures for success	Knowledge of possible collaborators	<ul style="list-style-type: none"> - Trust develops - Ideas for joint working emerge 		<ul style="list-style-type: none"> - Dedicated project co-ordinator - Administrative project base - Feasible timelines - Timely communication 		
						Harmonization of: <ul style="list-style-type: none"> - Organizational procedures - Collection Management - Framework - Priorities

Figure 1. The Extended Collaboration Continuum.

to be shared and collaborations to develop “co-location of the museum and library might make collaboration more likely to occur and easier when it happened.”¹ *Collaboration* deepens the commitment between LAMs, so that in certain areas they become inter-dependent and working practices have to change. A shared vision is vital for substantive joint projects such as a shared IT infrastructure, shared provision of services, and this may be missing in forced colocation risking the success of the venture. Collaboration carries a greater risk than coordination and may require formal memorandums of agreement to ensure management commitment and resource allocation. *Convergence* happens when joint activities cease to be selective collaborations which require special project status. Instead there is a full commitment to integration around a common mission. Organizational procedures, the collection management framework and priorities are harmonized so that shared services are delivered from a shared infrastructure. There are risks associated with a lack of engagement from management and staff, a lack of resources and a lack of clarity about the aims and objectives of converging, but the main risk is that differences between LAMs are not properly addressed and procedures developed which are acceptable to all parties.

Benefits accrue as you move along the continuum. As trust develops between LAMs, so does the vision for a shared future and the commitment to making it happen. Investment in shared projects reaps results and increases confidence, so that the ambition for the scale and inter-dependence of future projects grows. Development in staff through training and increased experience leads to professional flexibility and the incremental development of best practice. Additional benefits accrue from coordination, collaboration and convergence. Shared resources, be they human, financial or through shared infrastructure can lead to efficiencies. Such efficiencies can enable better services, invigorated outreach programmes, improved catalogues and the creation of digital resources. The result is greater visibility and increased user numbers.

A number of triggers prompt movement along the collaboration continuum. The identification of a resource gap may start an investigation into possible partners to help plug the gap, and maybe partner in a bid for project funding. Gaps may relate to financial constraints for activities outside the core service, a lack of applicable skills for new initiatives, to develop infrastructures for new modes of service or IT, or a lack of suitable space. Moves along the continuum are generally started by what Zorich, Waibel, and Erway termed a “... ‘change agent’—a trusted individual, partner or program that keeps the effort alive, injects it with a dose of resources (ideas, technology, staff) at the right time and keeps the participants focused on the overall vision they are aiming to bring to life.”²

Change agents are characterized by Zorich, Waibel, and Erway as a “trusted individual, partner or program” a LAM,³ but they are as likely to be a co-ordinator appointed to keep project on track, to be an umbrella policy organisation which fosters a spirit of collaboration, or one which makes available an appropriate funding stream. Collaborative activities championed or funded by a *change agent* need the support of management through a mandate if a shared vision is to develop. Staff incentives, both financial or through professional recognition, such as promotion or the chance to present their work at meetings and conferences can help to keep a vision alive.

² Zorich et al., *Beyond the Silos of the LAMs*, p. 24.

³ Ibid.

4. Conversance and Contact

The distinctions between LAMs are deep rooted in the separate identities of the professions, and before any progress can be made along the collaboration continuum, LAM professionals need *conversance* of these differences, so that trust can start to develop in a spirit of mutual understanding and respect.

The international bodies representing the three professions: the International Council on Archives (ICA), the International Council of Museums (ICOM) and the International Federation of Library Associations (IFLA) each publish a code of ethics (the latter in draft at the time of writing) which establish the values, principles and activities for the respective professions. These show a marked difference in their content, and core divergences in the emphases of the three professions.

*The ICA Code of Ethics*⁴ stresses the management of the materials in their care, defined as the documentary heritage: records, documents and archival material. The emphasis is on maintaining the characteristics of an authoritative record, which are defined by *ISO 15489: The International Standard for Records Management* as: authenticity, reliability, integrity and usability.⁵ The individual practitioner's primary duty is identified as the maintenance of the integrity of the records to ensure their reliable evidential nature. Protection of the authenticity of records is necessary to maintain the archival value of records, while ensuring usability through maintaining continuing access and intelligibility. The Code stresses the implementation of "good recordkeeping practices throughout the life-cycle of documents"⁶ to maintain "the archival value of records."⁷ Archival value is maintained through practicing archival principles when undertaking and recording the recordkeeping tasks of: appraisal, arrangement, description, preservation and conservation. Archival principles, first defined in 1898⁸ still form the basis of professional activity.

- Principle of provenance: "records created or received by one recordskeeping unit should not be intermixed with those of any other."⁹
- Principle of original order: "records should be maintained in the order in which they were placed by the organization, individual, or family that created them."¹⁰

For archivists the initial selection of material should be undertaken with impartiality and due regard the evidential value, while taking account of corporate and personal privacy. Providing access to the materials is not the primary concern of *The ICA Code*, and although the provision of an archival service is expected, there are a number of caveats concerning possible imposition of access restrictions.

¹⁰ *Ibid.*

By contrast the draft *IFLA Code of Ethics for Librarians and Other Information Workers* identifies the provision of access to information as the core mission for information professionals.¹¹ Five of its six clauses discuss the professional requirement to provide unrestricted, effective and indiscriminate access to information, with articulation of the profession's support for open source environments and intellectual property rights that enhance creativity. The emphasis on access is linked to societal need to share information and the rights set out in Article 19 of the *Universal Declaration on Human Rights* "to seek, receive and impart information and ideas through any media and regardless of frontiers."¹² However, the code also reflects the *Five Laws of Library Science*¹³ that established the core ethical values of the library profession.

1. Books are for use rather than for preservation – leading to vitalisation of the library
2. Books are for all rather than the chosen few – making the library a responsibility of society for the education of all
3. Books should be openly accessible, arranged and catalogued to promote discovery – enabling both structured and serendipitous discovery
4. Save the time of the reader – library management should be reader-centric enabling fast and efficient retrieval
5. The library is a growing organism – enabling growth and change in the service

Unlike the *ICA Code*, the *IFLA Code* does not dwell on the actual activities required to manage the materials beyond: the need to "organize and present content" to allow autonomous access; and the definition of published policies for "selection, organization, preservation, provision and dissemination of information."

The ICOM Code of Ethics for Museums takes a corporate rather than a personal view of the profession, and as such details the policies, processes and responsibilities required to underpin their responsibility for the natural and cultural heritage, and the legal framework in which museums operate.¹⁴ More holistic than either the *ICA Code* or the *IFLA Code* it identifies both the management of the materials in their care and as the promotion of their collections as the primary responsibilities. The underlying ethos is "that of service to society, the community, the public and its various constituencies, as well as the professionalism of museum practitioners."¹⁵ The current code grew out of the *Ethics of Acquisition* that identified "certain principles of ethics and professional integrity in relation to acquisition" and reinforced the ethical link between acquisition of materials and their use for research,

¹⁵ *Ibid.*, p. iv.

education and conservation.¹⁶ This link between collecting and service to a user community was established in the first *Code of Ethics for Museum Workers*:¹⁷ “their [museums] value is in direct proportion to the service they render the emotional and intellectual life of the people. The life of a museum worker is essentially one of service.”¹⁸

The rounded inter-relationships of ethical concerns for the museum profession have been summarized as an equal balance between collections care and public service.¹⁹ This balanced ethical outlook contrasts with the collection centric view of the archive profession and the user centric view of the library profession. The fundamental differences in character between archives and museums have been summarized as “archives are more often wholesalers and largely contribute to the products of others

...museums were retailers with direct products for users.”²⁰ Libraries similarly offer a direct product and access methods for their users.

Becoming *conversant* with the practices of a different domain so that the professional landscape can be fully understood, and making *contact* through, for instance, the sort of casual networking offered by the cross-domain conferences highlighted above or social networking channels, can ensure a deeper understanding of the different professional stances in an experimental, low risk and low commitment environment, before any commitments to further activity are made.

5. Cooperation and Coordination

Despite the different collection focuses and divergent ethical emphases, the three *Codes* show that there is cross-sectoral agreement that their function is the care of collections and provision of access to these, so that they can be used. These “key commonalities of collecting” are the basis of the movement along the continuum to *cooperative* and *coordinated* activities.

LAMs are distinguished by institutional persistence and user trust, which are the basis of the development and continuation of knowledge communities.²¹ Crucially, although divergent in the types of material they collect, LAMs all provide sustainable collections which are managed by experts. Their role as “sustained institutions to collect, organize, preserve, and provide access to knowledge-bearing objects” co-evolved their expertise, methodologies and tools for organizing and interpreting knowledge²² so that parallel systems were developed for the core tasks this involves.

²¹ Margaret Hedstrom and John King, *On the LAM: Library, Archive, and Museum Collections in the Creation and Maintenance of Knowledge Communities* (Paris, France: Organisation for Economic Co-operation and Development, 2002), accessed 30 July 2012, <http://www.oecd.org/dataoecd/59/63/32126054.pdf>.

²² Ibid.

LAMs can only ensure the sustainability of collections and expertise knowledge management function in an organizational environment which ensures the “physical and moral defence” of their collections.²³ That is the physical and intellectual security of collections, through effective collections management underpinned by policies which address both the organizational environment and the day-to-day administration.

The UK’s *Publicly Available Specification (PAS) 197* identifies the similarities of processes and procedures across the LAMs, articulating a cross-sectoral *Code of Practice for Cultural Collections Management*.²⁴ A thesaurus to the collection processing workflow across the disciplines is provided,²⁵ clearly identifying a limited distinction in information organization practices (Table 1), despite the semantic differences. All three disciplines: identify items to collect; receive them into their care; classify, catalogue and index; and periodically review and remove items from the collection.

Table 1. Collection Processing Workflow in PAS 197.²⁶

Workflow Order	Library Item	Archive Item	Museum Item
1	Selection	Pre-accession	Entry
2	Acquisition	Accession	Acquisition
3	n/a	n/a	Accession
4	n/a	Appraisal	n/a
5	Cataloguing	Cataloguing	Cataloguing
6	De-accession / Withdrawal	De-accession	De-accession / Disposal

The PAS provides a discipline neutral Collections Management Framework which includes these information organization procedures as part of an overall collection management policy, administered within an encompassing organizational remit in which the policies, processes and procedures are constantly monitored through internal audit and management review, so that improvements can be made. The collection management policy also includes the collection administration areas of: collections development, collections access and collections care. A granular list of processes, again domain neutral, associated with each of these areas is supplied in the PAS. The exhaustive list of activities will be familiar to all in the LAM professions and includes, for example, condition checking, displaying and exhibiting, assessing impact and packing.

These similarities can form the basis of cooperative and coordinated activities where areas of synergy can be explored, information on best practice shared and the possibilities of co-location of services can be explored for the benefits of both staff and users, along with financial and space saving benefits.

6. Collaboration for Digital Collections Creation and Management

In the digital age access to documentary heritage is no longer geographically restricted to those who can present themselves in person, relying on a cultural organization's ability to produce a physical object on request. Archival documents and copies of books are increasingly provided in digital format through the Internet, making digital surrogates, cheap to the end user, ubiquitous across information management disciplines. These preserve the original from over-use, but more pertinently provide both remote and multiple user access. Archives and museums are challenged by the management of both digitized and born-digital documents; libraries are dealing with the rise of the eBook; and the academic sector is grappling with institutional repositories and research data management. Collection development is also no longer restricted by the physical location of the material, or guardianship of the trusted organization charged with the primary care of the authentic copy. Collaborative virtual libraries, which serve a community of interest, or bring together related or separated materials, can be readily developed.

Since the late 1990s much collaborative effort has been dedicated to enabling the online delivery, search and discovery of materials held by LAMs. Gibson, Morris, and Cleeve noted that many of the collaborative projects they studied had some level of digitization, federated search, or shared database activity.²⁷ Yarrow, Clubb, and Draper noted global, continental, national and local initiatives to create collaborative digital resources.²⁸ Most strikingly, participants in Zorich, Waibel, and Erway's 2008 study only identified digital initiatives as a basis for their collaborations.²⁹

In the late 1990s the US Digital Libraries Initiative acted as the "change agent" in USA, providing funding to experiment with the possibilities of new technology. In the UK this role was taken through funders such as the Joint Information Systems Committee (JISC), initially through its explorative eLib Programme, which emphasized the practical collaborative application of technologies to providing materials for learning and teaching.³⁰ Other UK funders such as the Arts and Humanities Research Board (AHRC) also provided competitive funding for collaborative digitization projects focusing on providing scholarly materials for research analysis through the new discipline, digital humanities.³¹

A skill base in digitization was initially built through hand-crafted *boutique* digitization projects, "for which the principal goal [was] experimentation with new technologies and extraordinary attention to the unique properties of each artefact."³² As more sophisticated practice developed the focus shifted to "the creation of useful and relevant collections that served the needs of one or more communities of users."³³ Many organizations now undertake mass digitization, or orchestrate the federation or

aggregation of diverse digital materials from a range of cultural organizations. There are many such projects worldwide and only three, with local resonance for the author are mentioned here as examples of the range of activities being undertaken. Europeana is a European scale project originally funded by the European Commission's eContent^{plus} Programme.³⁴ It "...provides single access point to millions of books, paintings, films, museum objects and archival records that have been digitized throughout Europe³⁵ ... [which] enables people to explore the digital resources of Europe's museums, libraries, archives and audio-visual collections"³⁶ through aggregation of resources and metadata cross-walking. The best practice guidelines from the associated Europeana Travel Project³⁷ identify the most appropriate guidance available in the areas of: content creation and access, digitization project management, and user studies.³⁸ On a national level, the People's Collection of Wales³⁹ is a project sponsored by the Welsh Government. It not only aggregates resources from Welsh LAMs, and associated cultural heritage organisations, but taps into the collaborative content creation spirit of Web 2.0, by enabling any group or individuals to participate by contributing their own materials, which then go through a quality assurance process. This project directly addresses the "... tension between the vision of seamless collections access and community engagement on local Web sites, and the shift to online user behaviour where access and engagement now occur at a broader network level" expressed by participants in Zorich, Waibel and Erway's study.⁴⁰

On an individual organizational level, the National Library of Wales undertakes large digitization projects of diverse materials of cultural significance to Wales, as a core funded activity, while leading collaborations in externally funded aggregation projects. A current project, funded by JISC "will conduct mass digitization of primary sources relating to World War One from the Libraries, Special Collections and Archives of Wales."⁴¹

7. Digital Collaboration and Technical Skills

Building digital collections is now a mature activity and holistic international best practice, which addresses all of the socio-economical, organizational and technical challenges, has been developed iteratively. Best practice in digitization, and caring for born-digital materials, has been collated and codified by the US National Information Standards Organisation (NISO); a US led international

³⁴ The eContent^{plus} programme closed on 31 December 2008. Its successor is the Information and Communications Technologies Policy Support Programme which now has Europeana as its first objective – see accessed 31 July 2012, http://ec.europa.eu/information_society/activities/econtentplus/index_en.htm.

collaborative effort, intended for the domain neutral “cultural heritage” and “funding” organizations.⁴² This guidance considers *good* digital collections in the context of four sets of principles relating to: 1) collection development and processing; 2) digital object creation and management; 3) metadata creation and management; and 4) public service and project management.

The *initiative principles* of the document, which mostly relate to public service delivery will be familiar activities to LAM professionals concentrating on project management, staffing marketing and evaluation. Meanwhile, eight of the *collection principles*, on face value are activities for which form the basis of LAM professionals ethical codes and for which they are trained. Table 2 shows how they can be mapped directly onto the collection care areas covered by the PAS Collection Management Framework.⁴³

Table 2. Elements of the PAS 197 Collections Management Framework
Mapped Against the NISO Collections Principles.⁴⁴

PAS Collection Management Framework	Collections development policy, processes and procedures	Collections information policy, processes and procedures	Collections access policy, processes and procedures	Collections care and conservation policy, processes and procedures
NISO Collections Principles	Principle 1: A good digital collection is created according to an explicit collection development policy.	Principle 2: Collections should be described so that a user can discover characteristics of the collection, including scope, format, restrictions on access, ownership, and any information significant for determining the collection's authenticity, integrity, and interpretation. Principle 5: A good collection respects intellectual property rights.	Principle 4: A good collection is broadly available and avoids unnecessary impediments to use. Collections should be accessible to persons with disabilities, and usable effectively in conjunction with adaptive technologies. Principle 6: A good collection has mechanisms to supply usage data and other data that allows standardized measures of usefulness to be recorded.	Principle 3: A good collection is curated, which is to say, its resources are actively managed during their entire lifecycle. Principle 9: A good collection is sustainable over time.

However, the actual activities they describe require, in the main, technical or specialist training and knowledge for implementation: access restriction needs knowledge of digital authentication procedures and digital assurance; respecting intellectual property rights needs knowledge of digital governance; and lifecycle management needs knowledge of digital preservation procedures. The remainder of the collection development principles deal with a completely new skill-set which requires IT competency: the

⁴² Ibid., p. 1.

⁴³ British Standards Institution, *PAS 197: Code of Practice for Cultural Collections Management*, p. 7.

⁴⁴ Ibid.; NISO, *A framework of guidance for building good digital collections*.

need for a collection to be interoperable for repurposing and contextual understanding; the need for a collection access methodology to integrate with a users normal workflow through the provision of organizational and collaboration tools; and the need for a collection to be sustainable over time. The same is true for the principles relating to the creation and management of a digital objects. Although the need to assign a persistent identifier and associated metadata, while maintaining contextual information and authenticity are familiar to all LAM professionals, the technical requirements of undertaking these tasks in the digital realm may not be. Exhaustive instructions for the creation of standards compliant, interoperable metadata which uses authority control, content standards and crosslinks to other resources to facilitate cross-searching while supporting the “long-term curation and preservation of objects in collections,”⁴⁵ signposts the need for specialist metadata practitioners to design data models before any cataloguing activity can be undertaken.

Developing and managing collaborative digital collections is now as much a technical endeavour as an information management one, and the emphasis is on the management and delivery of digital collections that “should be accessible through the Web, using technologies that are well known among the target user community,”⁴⁶ while advocating “the entire lifecycle of the digital collection and associated services.”⁴⁷ Successful delivery relies on both information professionals and IT professionals to build an interoperable technical architecture. The ambition, scale and complexity of most endeavours meaning it is no longer possible for a LAM professional with some technical know-how to *have a go*.

7.1 Convergence Through Digital Curation

The NISO guidance articulates an interoperable technical infrastructure, which considers the possibilities of long-term access, use and reuse from the outset, rather than an after-thought when the funding has ended.⁴⁸ Funding agencies are starting to mandate long-term maintenance of digital material created with their funding, in the UK taking their lead from the Research Councils UK’s *Common Principles on Data Policy*.⁴⁹ This focus on “ensuring that digital material is managed throughout its lifecycle so that it remains accessible to those who need to use it”⁵⁰ is the basis of *digital curation*. This new discipline considers all the activities required to maintain access to digital materials over the long-term, rather than the short-term goals of content creation. Long-term management cannot be undertaken as short-term projects, but requires a consistent funding stream, management structure and technical methodologies.

The Open Archival Information Systems Reference Model (OAIS)⁵¹ was identified, as “a common framework for digital preservation applications”⁵² while it was in development. It describes both the information architecture and the organizational requirements for the long-term care of digital material. This has formed the basis of much collaborative activity to provide technical applications including the development of storage solutions in the form of *open repositories*, and metadata standards for both

creating information packages⁵³ and describing preservation activities.⁵⁴ Like digital content creation, many of the activities required form the basis of LAM ethical codes. The *mandatory responsibilities* described by OAIS⁵⁵ can be mapped directly to the core activities of information professionals described in both their ethical codes and PAS 197 (Table 3). However, the technical challenge requires co-working with IT professionals, and specialist training to enable this are seeing the development of converged services.

Table 3. The Mandatory Responsibilities of OAIS Mapped Against Collection Management Procedures for LAMs.⁵⁶

Mandatory Responsibility of OAIS	Information Professionals Core Activities
Collect archival materials from the creator and accession into the repository supported by Collections Policy, Acquisition Policy and Accessions Policy.	Collect materials and accession into the collection supported by Collections Policy, Acquisition Policy and Accessions Policy.
Arrange, describe and ensure finding-aids are available for the material. Prepare the material for storage by removing anything harmful to long-term preservation, packaging appropriately and store in a suitable environment.	Arrange, describe and catalogue the material. Prepare the material for storage and store in a suitable environment.
Develop an Access Policy and access methodology to ensure the material can be made available to the identified users.	Develop an Access Policy and access methodology to ensure the material can be made available to the identified users.
Provide contextual information through arrangement and description—catalogues, finding-aids and interpretive materials.	Provide contextual information through provision of catalogues, finding-aids and interpretive materials.
Implement a Preservation Policy which ensures the materials do not deteriorate and are handled appropriately. Ensure secure storage so that records are not tampered with or inappropriately copied.	Implement a Preservation Policy which ensures the materials do not deteriorate, are handled appropriately and securely stored.
Ensure provision and procedures for access are in place for the identified users.	Ensure provision and procedures for access are in place for the identified users.

Digital curation is the *change agent* which is moving LAMs along the collaboration continuum from *collaboration* to *convergence*. The technical challenges and investment required mean that organizations are forced to pool experience and expertise. Best practice and technical methodologies are developing

⁵³ The Metadata Encoding Transmission Standard (METS) was developed explicitly to address the Information Model identified in section 4.2 of OAIS. More information can be found at: <http://www.loc.gov/standards/mets/> (accessed 31 July 2012).

⁵⁴ The PREMIS Data Dictionary for Preservation Metadata took OAIS as a developmental start point. The full standard can be found at: <http://www.loc.gov/standards/premis/v2/premis-2-2.pdf> (accessed 31 July 2012).

through consortia discussion and training⁵⁷ and collaborations developing so that shared missions and shared services and infrastructure are starting to emerge such as the MetaArchive Cooperative in the US, which openly declares interdependence between partners.⁵⁸ An example, local to the author, is the development of a shared digital curation service across Wales, being led by the Archives and Records Council Wales (ARCW).

Digital curation is now articulating its own agenda, based around this convergence of the core skills of LAM professionals and the discipline of informatics. Domain neutral continuing professional development courses, and awareness raising events, to bring LAM professionals up to speed; and optional training as part of relevant university courses, are now maturing into dedicated degree programmes that address both the procedural and technical skills required for information engineering.⁵⁹ Ataman has identified mainly technical skills in his list of *add-ons* for the information training: content presentation and management; trustworthy storage, digital forensics and e-curation, giving records management the procedural role.⁶⁰ Simmons College in the US received a grant in 2009 “for the development of a Cultural Heritage Informatics curriculum specifically designed to address the digital convergence of cultural heritage institutions - libraries, archives, and museums,”⁶¹ which brings together the social, technical, cultural and political concerns for stewardship to ensure *curation ready data*.⁶² Lee and Tibbo during the DigCCurr project analysed the core knowledge and capabilities which need to be developed, and the rationale behind these, to develop a holistic curriculum that considers both the conceptual and practical skills required by digital curation professionals. They identified the need to teach a professional context for digital curation with values and principles as a discipline in its own right, along with the technical requirements for ensuring digital material remains useable and useful.⁶³

9. Digital Creation and Management Continuum

Digital creation and management has followed its own continuum becoming increasingly sophisticated as technologies advance, the possibilities for their implementation are explored, and best practice develops.

⁵⁷ In the UK the Digital Preservation Coalition (DPC), a cross-domain collaborative membership organization offers training, support and networking. The Digital Curation Centre (DCC) also offers these, but focuses on research data management in Higher Education.

⁶² The properties of curation ready data can be found in Figure 2.2 of: Sarah Higgins, “The lifecycle of data management,” in *Managing Research Data*, ed. Graham Pryor (Facet Publishing, 2012).

⁶³ Helen Tibbo and Christopher Lee, “Convergence through Capabilities: Digital Curation Education for Libraries, Archives and Museums,” in *Archiving 2010 (IS&T, 2010)*, pp. 53-57, accessed 31 July 2012, <http://www.ils.unc.edu/callee/p53-tibbo.pdf>.

User needs are driving the need for better, bigger and more stable resources, with improved delivery methods:

... it is also necessary for cultural institutions to go beyond the provision of mere databases of disparate objects and intellectual items, to create compelling navigational and learning experiences for end-users and to provide appropriate contexts for use and learning.⁶⁴

The depth of collaboration between LAMS has followed this continuum with *coordination* of small scale experimental projects giving way to *collaboration* to develop federated or aggregated services. The maturity of practice is now starting to require *convergence* to deliver a shared infrastructure for digital curation (Figure 2).

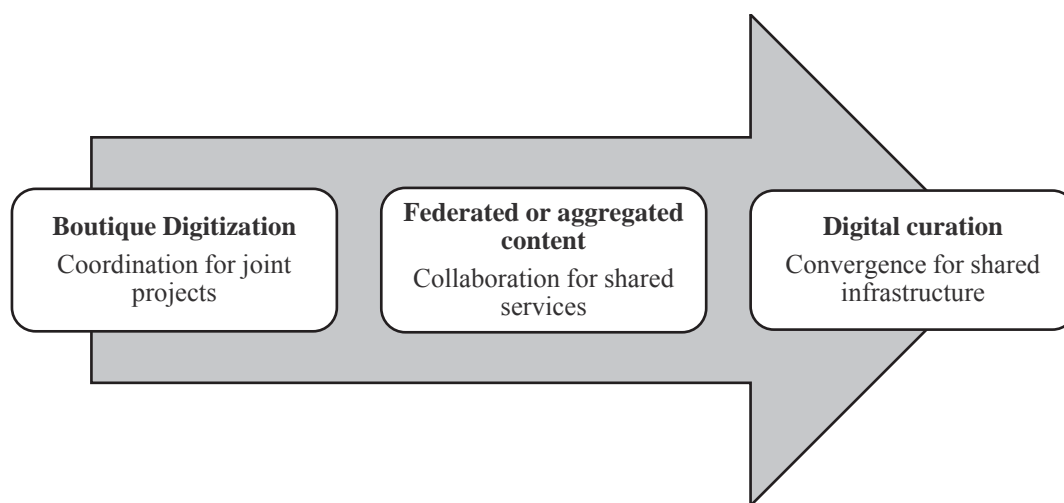

Figure 2. The Digital Creation and Management Continuum

Conclusion

Collaboration across LAMs follows a continuum with increasing levels of trust, integration, commitment and benefits as organizations move through the different stages. Movement between the stages is usually triggered by the need to address a resources gap, and the presence of a change agent to deliver the incentive. Change agents have been prompted by technical advances and development of best practice for digital collection development and management. Not every library, archive or museum is on the same stage in the collaboration continuum, but the imperatives of the digital age mean that most have started the journey, deriving benefits from shared resources and the efficiencies this brings, as trust develops and vision and commitment increase.

Digital Curation

Building an Environment for Success

Jackie R. Esposito

University Archivist and Head, Records Management Services, Penn State University, USA

Abstract

Successful digital curation requires two distinct but dependent sets of operational tools. The first set of tools focus around the archivist/curator identifying and becoming familiar with technical components necessary to implement a viable digital curation operation including the establishment of a digital repository service. The second set of tools, and arguably the more important of the two, is team building. Digital curation at any institution requires developing an ever-changing web of personal, organizational, cooperative, conceptual, and contractual understandings, agreements, and consensus points as well as concurrent relationships. This presentation discusses, in practical terms, the steps, processes, policies, and procedures that need to be established to provide reliable, long-term access to managed digital resources to its designated community, now and into the future. In addition to reflecting on the standard stages of digital curation, it identifies team-building skill sets that will move a digital curation agenda toward both long- and short-term success.

Author

Esposito has been serving as both faculty and administrator for the Penn State University Archives since 2001. She joined the faculty of the University Libraries in July 1991 as Assistant University Archivist for Records Management/Senior Assistant Librarian. She was tenured and promoted to Associate Librarian in 1998. Esposito co-authored Penn State's *ElectRar: Electronic Records Repository Specifications Report*, presented several conference papers on team management of born-digital records utilizing the Matryoshka (Russian Nesting) dolls theory and served on the development team for the Society of American Archivist's Digital Archivist Certificate Curriculum Program.

1. Introduction

Successful digital curation requires two distinct but dependent sets of operational tools. The first set of tools is focused on the archivist identifying and becoming familiar with technical components necessary to implement a viable digital curation operation including the establishment of a digital repository service. The second set of tools, and arguably the more important of the two, is team building.

Digital curation at any institution requires developing an ever-changing web of personal, organizational, cooperative, conceptual, and contractual understandings, agreements, and consensus points as well as concurrent relationships. This paper discusses, in practical terms, the steps, processes, policies, and procedures that need to be established to provide reliable, long-term access to managed digital resources to its designated community, now and into the future. In addition to reflecting on the standard stages of digital curation, this presentation will identify team-building skill sets that will move a digital curation agenda toward both long- and short-term success.

2. Methodology and Scope

This paper reflects on observations from the Society of American Archivist's Digital Archivist Specialization one-day workshop of the same name, taught by this author, dedicated to identifying both the minimum digital curation skill set in conjunction with necessary team building philosophies to begin a program for institutional born-digital archives, records management, and long-term digital preservation. The workshop, as currently designed, establishes five stages of digital curation: 1) **Acknowledge**—the local scope of the issue and its long-term responsibilities; 2) **Act**—initiate “S.M.A.R.T.”¹ projects; 3) **Consolidate**—segue from projects (temporary) to programs (permanent) in staffing and funding; 4) **Institutionalize**—incorporating the larger environment and rationalize programs as part of the operational imperative and permanent budgetary structure; and 5) **Externalize**—embrace inter-institutional collaboration and cooperation.

The workshop also covers and discusses opportunities for success, strategic goals for digital curation, establishing working groups and hot teams, basics of managing electronic content, creating a curation management prototype structure, digital curation management essentials, building effective teams and engaged stakeholders, essentials for digital repositories, and measuring success while re-evaluating goals.

The learning outcomes cover five key areas including:

- An understanding of the components of team building and digital curation necessary to begin working towards a curation prototype in your institution;
- Identification of areas to invest in locally to build knowledge and skills to meets the needs of a digital repository program at your institution;
- Reviewing existing digital repository characteristics that best illustrate roads to success;
- Access to resources, guides, models, and best practices relevant to the digital curation/repository landscape; and
- Identifying and establishing relationships within your organization to achieve a digital archives repository program.

This paper will evaluate the workshop's goals and learning objectives in light of their applications in a real-world environment by utilizing follow-up survey technology for workshop participants. In addition, the paper will reflect on specific team building relationships that consistently work in institutional environments, specifically working with information technology professionals or coordinating scholarly publications with archival repository management. The guidelines developed for creating an environment for success will be quantitatively evaluated as well as qualitatively summarized utilizing narrative focus group summaries.

3. Background on Digital Archives Specialist (DAS) Certificate Program

The Society of American Archivists undertook the development of a certificate program² in 2010 by charging a Digital Archives Continuing Education Task Force to develop a detailed curriculum on digital archives. The Task Force was chaired by Geof Huth (New York State Archives) and included Mahnaz Ghaznavi (Loyola Marymount University), David Kay (Little Airplane Productions), Helen Tibbo

¹ S-M-A-R-T is a mnemonic that stands for Sensible, Manageable, Achievable, Reasonable and Trackable. The point of SMART planning is creating an environment where projects are do-able within a specific period of time.

² www2.archivists.org/prof-education/das

(University of North Carolina/Chapel Hill and this author. The Task Force reviewed existing course offerings and identified curriculum components for awarding a certificate. The proposed curriculum was distributed to sixteen (16) SAA sections and roundtables for comment in March 2011. The Curriculum was edited and revised before being adopted by the SAA Council at its May 2011 meeting.

The DAS curriculum is structured utilizing four tiers of study:

Foundational Courses: essential skills needed to manage digital archives (geared toward practitioners);

Tactical and Strategic Courses: skills needed to make significant changes to develop a digital archive or work managing electronic records (geared toward managers);

Tools and Services Courses: skills needed to work with specific tools and services utilized in managing digital archives (geared toward immediate use);

Transformative Courses: skills needed to change and transform institutions into full-fledged digital archives (geared toward administrators).

A participant has to successfully complete nine (9) required courses from the four tiers and passed the comprehensive exam within a twenty-four (24) month period to receive the DAS certificate. Individual course examinations, multiple choice questions, are provided online immediately after the course is offered.

The curriculum, which features eight (8) foundational courses, eleven (11) tactical/strategic courses, four (4) tools and services courses, and three (3) transformational courses, is based on seven (7) core competencies including:

- Communicating requirements, roles and responsibilities related to digital archives
- Understanding the nature of records in electronic form
- Formulating strategies and tactics for appraising, describing, managing, organizing, and preserving digital archives
- Integrating technologies and tools
- Planning for the integration of emerging technologies
- Curating, storing, and retrieving original masters and access copies
- Providing dependable organization and service
